Ten years ago, Uriah Atherton Boyden, a wealthy and eccentric gentleman, died in Boston, leaving a fortune of more than \$200,000 to a Board of Trustees, with discretionary power to employ it in establishing and maintaining an astronomical observatory on some mountain peak. His definite aim was to overcome the hindrances to astronomical work at ordinary elevations, the nature of which we have just explained. This fund is now managed by the Harvard College Observatory, and experimental research has been conducted at high altitudes in different parts of the globe, in order to show the precise nature of the improved conditions of vision, and to ascertain the best location for the mountain observatory.

It was in the interest of this research that our expedition ascended Fuji-san. Nothing could have come more acceptably than the courtesy of General Count Yamagata, Minister of the Japanese Department of the Interior (Naimusho), in detailing Dr. Knipping, the meteorologist of the Central Observatory, as a member of the expedition. Dr. Knipping had already several times ascended the mountain, and mapped the entire region about it, as indeed the whole of Japan. With Dr. Holland, the naturalist of the Eclipse party, Mr. Masato, of the Central Observatory, and the "handy man" Magobe, we set out from Tōkyō in the early morning of September 1, a party of six. Our instruments, though few, were of the best: among them a set of meteorological apparatus, a 3½-inch telescope kindly lent by the Japanese Naval Observatory, and a 7¼-inch telescope brought from the Amherst

Observatory, and arranged for photographing celestial objects. As the accompanying map, compiled from the latest Japanese authorities, will show, the Kyoto railway, running south-westerly from Yokohama, passes nearest the mountain at Gotemba, where the tourist to Fuji-san may now alight. We found the road then open only to Kodzu, whence the journey to the summit of the great cone had to be made by packhorse and on foot. The peak may be ascended by five different trails, according to the route by which the base of the mountain is reached. On the advice of Dr. Knipping, our expedition made the ascent on the east flank, from Subashiri, a moderate village about 3½ *ri*<sup>2</sup> directly east from the summit. Leaving the train at Kodzu, a small sea-town, a part of an hour's waiting was spent in wandering on the hot, stony beach, where numbers of Japanese children followed us, picking up pebbles and presenting them to us, with faces full of interest and good nature. With the *kori*, or traveling-baskets, the instruments and luggage piled into various jinrikishas, and the members of our party in others, we were a noticeable procession, starting off gaily from the little station.

Shortly after leaving the town our road bade good-by to the ocean, turning off into a narrow valley which led apparently to the heart of the hills. The intense green of a summer landscape in Japan is perhaps its most beautiful characteristic. To this luxuriant appearance the groves of bamboo add exquisite grace. Often as high as forty feet, their masses of delicate yellow-green foliage, almost angular in the sunlight, give an effect of matchless airiness. The higher we climbed, over a well-

<sup>1</sup> A word and a picture will explain. At the low elevations where observatories are ordinarily built, the atmosphere offers a serious obstacle to the prosecution of work with the telescope. For the most part this is due to the nocturnal radiation of heat stored up during the

AN EXPERIMENT TO ILLUSTRATE THE DISTURBANCE OF TELESCOPIC VISION CAUSED BY HEATING THE AIR UNEVENLY.

day by the ground and buildings near by. The actual phenomena are well illustrated if a telescope is placed as in the figure, and focused upon any sharply curved glass surface, thirty or forty feet away; as, for instance, the convex bottom of a broken champagne bottle *R*. When the sun *S* is shining upon such an object, a brilliant artificial star will be seen in the field of view, and

surrounded by a few diffraction rings, as shown at *A*. Push the eyepiece in, or draw it out, and the image of the star will enlarge to a disk, like *C*; and if the telescope is all right, this disk will be perfectly circular, and evenly illuminated throughout. Now place a lighted lamp at *Q*, and observe the effect. *A* will become like *B*, an irregular lump of light with rays shooting out in every direction; and *C* like *D*, a disk bright in some parts and dark in others, with a continual dancing and vibration of the illuminated and unilluminated parts over the entire area. Remove the disturbing heat-source *Q*, and *A* and *C* soon appear as before. In a greater or less degree, these conditions of disturbed vision are always present in telescopic observations of the stars, while if the planets are looked at with high magnifying powers, the sharp details of their surfaces become a confused blur, and often so wavering that the astronomer has to make them out, as best he may, from momentary glimpses when the images are least unsteady. The atmospheric shell encircling the earth is a hundred miles and more in thickness; but by its own weight is so much denser in the lower than the upper strata, that an ascent of twelve to fifteen thousand feet is sufficient to leave one third of the total atmospheric mass below, and with it the main source of interference with telescopic vision.

<sup>2</sup> The Japanese mile, or *ri*, is equivalent to 2.44 English miles.

traveled road, the more delightful the country became. Rich ferns grew from the mountain-side, almost overhanging the road; frequent springs gushed out of mossy banks on one side, while on the other was a foaming stream now far below. What with the strange and lovely plants, the picturesque villages where tea and sweetmeats awaited us, the fascinating stream growing more impetuous in its rush to the sea, and the sea itself far behind, closing up our vista of green valley, we reached our stopping-place all too soon. Long before the sun had begun to think of setting we found ourselves high among the hills, ten *ri* from Kodzu, rattling over the stony street of Miyano-shita.

The air here was delicious, and hot sulphur-springs have made the place a famous resort, possessing two excellent European hotels. The town seemed to be especially noteworthy in its display of fine wood-inlaying. Small screens and large ones, desks, tables, boxes, cabinets—all were of some dark wood, most exquisitely inlaid with various lighter-colored woods, in strange and beautiful patterns. We were told later that both the fine bamboo carvings and this inlaid wood cannot stand the dry heat of American houses. Our bamboo carvings have split here and there, while the Miyano-shita inlaying is unaltered.

Sunrise the following mornin<sup>g</sup> found us far on our walk toward the night's sleeping-place, Subashiri, at the base of the great sacred mountain, and 2500 feet above the sea.

The road—chiefly bridle-paths through cool woods and over hillsides, up and down, in and out—is impracticable, for the most part, for

jinrikishas. The distance is seven *ri*, and pack-horses were available for the heavier luggage, with *kago* for occasional ease. Passing through the attractive little village of Kiga,—cool, shady, damp, with its ponds of goldfish, and filled with water-murmurs,—we walked on and on to the top of a bare hill, from which we looked down on the thatched roofs of Kiga nestling among its myriad trees, beyond to Miyano-shita, and still beyond to the gray-blue sea and its misty horizon. The breeze was cool and refreshing, and after a brief rest we struck into a high sort of moorland which the Japanese call *hara*, a heath where grow nothing but tall, soft grass and low shrubs. Gradually the path grew steeper, and Dr. Knipping informed us that we had reached the ridge separating us from the level country surrounding Fuji-san. Up this pass—Otomi-toge—we made our way. It is more than three thousand feet high, and a hard pull over a stony path bordered with flowers and shrubs. At the top a magnificent view greeted the eye. Miles of level farming-lands lay spread out below, the bright green rice-fields looking hardly larger than pinheads, and whole towns mere specks of brown. Fuji himself, to crown this view, would have been grand beyond description; but, as usual, his majesty was wrapped in a gigantic white cloud, covering his imperial head and shoulders, if not more. We saw only for an instant a half-defined glimpse of the lofty cone—

Fast fixed to earth,  
But ever heavenward tending.

After a comfortable luncheon and rest on the pass we began the descent, far more wear-

some than the climb. Sunny fields, full of summer scents and sounds, led us at length to Gotemba, a pretty village only five miles from Subashiri, and where at the tea-house we found watermelons so delicious that the memory of them haunts us yet. The road thereafter is level and fine, overarched most of the way with large trees. All the hotels in Subashiri, except one, refuse to entertain foreigners. So to the Yona-yama we repaired, well content to rest and be waited upon after our day's walk. Jiu-hei, as we understood the proprietor's name, saw that excellent rooms with chairs and a table were provided. Through a long passage where the wood shone from its repeated polishings, past the general bathing-tank, past a little garden where the sun could never penetrate to the mossy stone lanterns and luxuriant ferns, up four steps, and the rooms were reached. Through the long, low, sliding windows we

About three o'clock the following morning we had our breakfast by the feeble light of candles. The Japanese appear to be up all night under the best of circumstances, so it seemed perfectly natural that the smiling little maids should serve us apparently in the middle of the night. The moon was just setting behind Fuji, looming very near and black, when we set forth upon our walk of twenty-two miles to the summit. For seven miles we had the services of an obliging packhorse, through a level country, dreary and monotonous, partly wooded by scrub-pines. Volcanic remembrance already began to turn smiling, genial Japan into a sullen land, thinking of woe. In the midst of this desolate region, a hopeful brightening in the east soon became the oncoming glories of a superb sunrise, and soon after this we reached the first station of the real ascent. Uma-gayeshi ("horse-turn-back") is 4400 feet

looked out over a hundred gardens, thatched and flowery roofs, and immense well-sweeps whereon the bucket was balanced by a stone, as may be seen occasionally on back-country New England farms. Beyond, the black sides of the kingly mountain brooded, though the crown was still veiled.

above the sea; and as nothing less than humanity is allowed to proceed farther up the sacred slopes of the peerless mountain, and even the *kago* is forbidden, twelve coolies apportioned our load of instruments and luggage, and started ahead. Hundreds of pilgrim banners hung upon the walls of the inn, and after

KIGA.

a slight refreshment, chiefly in the form of pale-yellow tea, we followed on. From here the ascent is divided into stages, each marked by small stations, or halting-places.

Devout pilgrims, to the number of fifteen or twenty thousand, with banners in hand bearing the name of their town, annually ascend Fuji-san as a religious obligation, and to propitiate various deities. The prayer frequently made upon these occasions runs thus: "Purify me from my six roots of evil—the eyes, ears, nose, mouth, touch, and thoughts."

After leaving Uma-gayeshi, the walk for a long distance was thoroughly delightful. The sunshine sifted softly through greenest foliage to a mass of wild-flowers and ferns. The path—a sort of gully, sunk at least two feet below the general level of the wood—was fringed with ferns and delicate asters, while great roots protruded and overhung the edge like colossal petrified snakes. Airy white birches shook their fluttering leaves in the soft breeze, the Japa-

nese maples, beeches, and ash joined the ever-greens in making a shady canopy above; while maidenhair ferns, belated wild roses, yellow lilies, dwarf sunflowers, tall white serpentaria, and purple monk's-hood combined to hide the delicious wild strawberries lurking in the grass. At intervals through this lovely wood were temples and shrines,—many of them deserted for the year,—and an occasional intermediate station where tea and sweetmeats formed welcome greeting. The summer heat was slightly tempered with a brisk and cooler air, making the sunshine friendly; and flowers bloomed not only all about us, but even in the picturesque thatched roofs of the miniature temples; the whole was idyllic.

But suddenly, emerging from the trees, another world appeared. Before, above, around, lay miles of fire-baked lava, dull and hopeless in the sunshine—finished, dead. For a short distance now and then there were oases of verdure, where the hardiest of shrubs and flowers

had gained a slight foothold; and here, again, the charming wild strawberries grew luxuriantly. But these wooded spots—smaller, fewer, farther apart—soon ceased altogether, and we were left alone with the wind and the sky, and a stupendous mountain-cone,—all but overhanging us,—cold, lifeless, pitiless. For a time the sweeping wind was welcome; but it increased with every step. Straight down into our faces it pelted, as if indeed some mighty guardian of the mountain resented the invasion of impious feet. The difficulties of the climb had begun, and Dr. Knipping's oft-repeated caution against a too-rapid pace became almost unnecessary. Sharp lava in enormous masses lay in the path, and, indeed, on every side; very soon there was no path at all. The coolies with their burdens could be seen far ahead, clambering up and over and around, each in his own way, with cat-like agility. The wind became a hurricane; it beat upon us, it pounded us; frequently we had to cling fast to the lava-ledge with both hands until some particularly fierce gust had passed. Verily, hard-hearted is the god who would not be propitiated to the bestowal of any favor by a climb like this! And yet when some luckless pilgrim dies upon the summit,—and this occasionally happens,—he becomes, not, as might be expected, a martyr to his piety, but a being thereby proved too wicked to live any longer!

At one of the poor little stations—all of which, however, were inexpressibly welcome—soft rice-paper, India ink, and camel's-hair brushes were brought out for us to inscribe our names. The collecting of banners, *kakimono*, or scroll-pictures, and autographs seemed to have been a task dear to the heart of the proprietor, and he proudly exhibited his treasures. Among the hundreds of Japanese mementos were the names of a party of Europeans who had climbed Fuji two or three years before. The sudden sense of companionship on this lonely mountain, the instant leap of the heart at seeing the familiar letters, were sensations as agreeable as they were curiously new. We willingly painted our names for the old man, who, with all our coolies, watched us, deeply interested.

Farther than the sixth station, 9800 feet above sea-level, foreigners and women have not been allowed to ascend until recently. Since the dawn of wider intelligence, and a receptive opening of the national mind toward whatever is better in other countries, these restrictions have been removed. At five minutes after one o'clock in the afternoon we reached this station, and immediately upon sitting down the pulse was counted, and found to be 144 in the first minute. After a rest of fifteen minutes it registered 100.

Sweetmeats much more delicate and fresh than might have been expected were found at each station. But the most genuinely sustaining of our comforts was chocolate, of which Dr. Knipping had provided a generous supply. A mouthful or two, a bite now and then during some particularly hard pull, refreshed our lagging energies and added greatly to our strength; while if angels are ever met in pith helmets and gray suits, Dr. Knipping was certainly one of that kindly fraternity when, having climbed ahead, he met us at one station with steaming cups of this same delightful chocolate ready for each nearly spent traveler.

And now, to add further novelty to the day, a soft white cloud drifted down and about, or perhaps we climbed into its embrace, and its moist caresses added immense discomfort to every motion. If it hid the steep dangers below, it also enveloped the mighty cone above, and removed even the questionable pleasure of seeing what remained to be done. So we climbed blindly onward, drenched and chilled, seeing only the next step ahead, knowing no path, but keeping instinctively upward. Each pilgrim is provided with several extra pairs of straw sandals to replace those constantly worn through by the sharp lava. If, as is said, fifteen thousand pilgrims ascend the mountain every summer, and each one discards half a dozen pairs of this foot-gear during his climb, it is evident that there must be some straw sandals on the mountain-side. In the prevailing mist these cast-off *waraji* were now the only reliable indication of the trail. Occasionally the tiny tinkle of some pilgrim bell would steal softly through the thick white mist, growing louder as its owner came swiftly downward by another path than ours, then becoming fainter and yet more faint as the pilgrim, still unseen, strode quickly down toward the real world. Or perchance, looming through the cloud, a human form was barely discernible, a great, impalpable shadow, passing with its little bell in unknown nearness, to be speedily swallowed up in the encompassing gray.

Each station was poorer than the last,—many of them were closed, the pilgrim season practically ending with August,—but despite the increasing barrenness of those yet open, we could hardly have dispensed with their rude shelter and rest. Patience now seemed the most desirable virtue to add to strength of limb. Perseverance was after a time rewarded, for we climbed out of the cloud, and reached sunshine once more, though in a barren world. But small ills were speedily forgotten as we reveled in the sunshine and blue sky. The huge summit seemed overhanging,—the effect was startling,—while the path so lately traversed looked most precipitous. For an instant we seemed

DRAWN BY HARRY FENN, FROM A PHOTOGRAPH.

ON THE ROAD TO OTOMI-TOGE.

ENGRAVED BY G. P. BARTLE.

suspended in mid-air; the impression was irresistible and all-pervading. The black and red doleritic lava, dismal, fire-baked, monotonous, spread in countless acres around. Hundreds of feet below it was merged in the drifting fog through which we had made our laborious way to this bright and sunny but indescribably desolate region. The wind was still a hurricane, and directly above stood the eighth station, nearly eleven thousand feet from the sea-level, and the last available resting-place before the tenth, or summit-station. Straw sandals still lay thickly strewn upon the cinders, and after clambering with one great, final "spurt" over the steepest way we had yet come, the eighth station was reached about twelve hours after the early morning start.

"An angle of forty-five degrees" is an expression commonly used in conversation to indicate any sort of path somewhat out of level. As a matter of fact, a slope of even ten or fifteen degrees is far from easy. Applying the clinometer to the path now and then, its largest reading showed an incline of  $35^{\circ}$ .

The air by this time was too rare to breathe with entire ease, and the cold was intense. With no real window, and a sliding door generally closed against the tearing wind, the eighth station now held at least twenty-five persons; while a fire, smoldering in a hole in the floor and

without any chimney, bestowed its smoke impartially upon all. It would have been pleasanter, after resting awhile, to complete the climb and to sleep at the tenth station—Chodjo; but the majority of the party preferred to spend the night here—an impossible sort of thing, it seemed, with the circle of coolies crouched about the fire, the painfully smoke-laden atmosphere, and the absence of all comfort and convenience. But we unpacked the quilts and baskets, and tried to turn one corner into a series of attractive sleeping-apartments. This to a certain extent accomplished, we wrapped ourselves in cloaks, and stepped outside. Flecks of the great white cloud still hovered far below; but the sky was clear, and the sun had almost reached the vast mountain-shoulder behind us. The stupendous isolation of this vast peak now became fully apparent.

Rising from a level plain, undisturbed by lesser peaks to share the glory, its whole gigantic mass stands clearly cut, awful, unapproached. Far to the right was a shimmering, pale-blue sea with its curved beach; and northward, filling the distance, lay mountain-ranges and lakes in superb association: Hakone, the Otomi-toge, Nikko, and the rest, while Subashiri showed only as an elongated gray thatch. But the whole thing was too immense and impressive. Details vanished. As the sun sank

farther behind Fuji,—while yet the day was bright away from his dark influence,—an immense black triangle of shadow gradually crept outward and eastward from his base, until it covered leagues of smiling field and forest. The cold, the smoke, the strangeness of the air, mingle with all the grandeur in the memory of that night's passing. A shower of fine, wind-swept lava beat an incessant tattoo upon the roof, and when morning looked faintly in through the crevices of the hut, it was shrouded in another thick, wet, heavy cloud, which soaked even the lava to a sharper blackness than usual.

From the eighth station upward a toilsome climb of an hour over the slippery masses brought us to the artificial ledge, or narrow pathway along the front of the twelve huts constituting the tenth and final station. Testing the pulse at once, it was found to be 160 during the first minute, and must have greatly exceeded this during the actual exertion of climbing. After an hour's rest it was reduced to 100. Thoroughly drenched as we were, and hardly able to see a yard ahead for the fog, a warm room and dry garments seemed the acme of personal luxury. But it was found that a number of the houses had been closed for the winter, so that choice was even more limited than appeared at first. Each hut was a single room, each room too low to stand upright in, while lava blocks and rough boards proved small protection against the fierce wind and penetrating mist. Moreover, a strange heaviness of limb weighted every motion, and the rapidity of the pulse was most fatiguing.

It would almost seem that there must be something peculiar about this mountain. It is more than 12,400 feet high; but while travelers sometimes speak of entire absence of disagreeable sensation on other mountains of fifteen and even seventeen thousand feet of elevation, the usual testimony as to Fuji is of great discomfort. Of "mountain-sickness" proper, in its usual manifestations, we had none; neither any special lung-oppression, nor increase of respiration above the normal. But the heart beat tumultuously, and even slight muscular exertion sent the pulse well up to 120 or 130.

After much preliminary conversation the owner of the least repulsive hut agreed to let us have the use of it. Just why we should prefer to have it to ourselves, and what possible objection there could be to his allowing any number of stray pilgrims to sleep there also, he failed to see. But persuasion won the day, and he finally consented to our exclusive occupation, though in surprise and disapproval. His entire outfit for living was comprised in three or four plates and cups upon a shelf, a kettle making a feeble attempt to boil over the smoke in one corner, and a small skin upon

which crouched the proprietor of all this luxury. The time of our host was chiefly occupied in blowing his weak-minded fire through a bamboo tube, to keep in it even the semblance of life; in the intervals he smoked a tiny Japanese pipe. His stolidity and uninterested though persistent watching of our small efforts to promote order in our corners outwardly expressed our inner feeling. We ourselves were utterly stolid and heavy—dull, edgeless. We wanted to be warm, we wished for sunshine, to see one green, growing thing, to have the heart slow down its tempestuous beating; but everything was far away, and very much in general. The air seemed made of lead. In the afternoon the fog began to blow off, and we were soon in clear air, with the clouds dispersing in shreds far below. The same wide-reaching panorama which filled all the world from the eighth station now began slowly to unfold again. Here and there a distant mountain-top emerged from the whiteness; later, the cool green lakes were gradually uncovered, and the ocean, silvery in the soft atmosphere, began to shimmer in the east.

The summit shrine was at a point slightly above our hut, and we went to it, walking over lava literally covered with rusty *rin*<sup>1</sup> left by the devout. An occasional pilgrim arrived while we stood there, deposited his *rin*, and made straight for the lower regions with enviable alacrity. From this point the immensity of the desolate region became appallingly apparent. To the west, straight down 500 feet, lay the mighty crater, cold and dead, whose gloomy recesses were shaped by a power too terrible to conceive. One must walk about two miles to encircle the crater. Tons of grimy snow-masses filled the ravines of its southern slope. The immensity of the mountain appears nowhere more impressive than when looking upward from the bottom of the crater. There is no trail down the interior walls, but the descent into the cavern may be made in less than an hour, and is well worth the making. In large part the walls are very steep, and bits of lava now and then rattle down the slopes. A pool of green snow-water stands here a considerable portion of the year.

Too grand for words, too strange and fearful for enjoyment, too desolate and dreary for endurance, night at last covered this solitary mountain-top, seemingly forgotten even by God. Through the chinks and crevices in the lava hut the wind howled with an indescribably bitter and hopeless moan. Colder and colder grew the night. Water standing in the room was covered nearly an inch thick with ice (which in the morning the proprietor calmly broke for us to wash our faces!), yet the exer-

ON THE OTOMI PASS.

tion of getting more clothing was so great that the sharp chill was preferable.<sup>1</sup>

The stars shone constantly clearer, and toward midnight we had the instruments all at work. A few yards from the long row of huts was a small open space, where the telescope might command a clear horizon view in every direction. A stiff wind blew out of the west, with the thermometer below the freezing-point. To the east were the precipitous slopes of the mountain-side, and, opposite us, the overhanging crags of the cavernous crater. The telescope was mounted upon a large lava boulder, and much of the time had to be held in position lest it should be upset by the wind. Any one in quest of comfort would not elect to make astronomical observations under conditions such as these—and on top of a mountain two or three miles high, besides. However, the program was executed in spite of merely physical obstacles, and the hours of clearest sky lasted until even astronomers became weary. At stars in every part of the sky, to the north, south, east, and west, and at all altitudes from the zenith to the horizon, the telescope was pointed, and the conditions of vision tested by the steadiness of the spectral disks or images, just as in the case of the artificial star. So fine were these images, so nearly optically perfect the air, that for moments together there was scarcely a trace of atmospheric effects.

These were general tests. If they were satisfactory, of course the telescope could not fail to do its best work upon any special objects of whatever sort. A few double stars, suited to the capacity of the instrument, were tried, and the advantages were at once strikingly apparent. Companion stars hard to see, and "doubles" hard to divide, with the same glass at lower elevations, here were readily discerned. Even in looking at so ordinary an object as the moon, the edge or limb of which has been seen absolutely sharp by few astronomers, the effect was indescribable. So sharply defined were the details of the lunar surface, that if a suitable object-glass had been at hand, a magnifying power of 2000 diameters would at first have been used. The structural irregularities of the limb were so marked, and in many parts the moon's edge was so excessively jagged, as to lead one to wonder that the usual type of lunar observations can be made as accurately as they are. As dawn approached, Saturn had risen to an available altitude, and the ring-system was seen to the best advantage. While with

the moon high up it was impossible to detect even the slightest trace of "boiling at the limb," as the astronomer sometimes says, Saturn was less favorably situated, and a slender trace of undulation was now and then evident. Still, had the glass been large enough, a power of 1500 might have been used.

Of course these results were not surprising after the spectral images of the stars had behaved so finely. One great advantage of the spectral-image tests is that they can be made satisfactorily with a small telescope, while the tests upon specific objects usually require large and bulky instruments, which are hard to manage in mountain work. Just at sunrise we found that while all the lower world lay impenetrably shrouded in a thick white cloud, out of this smooth, soft sea Fuji-san rose like a volcanic island—a deep blue sky above without a fleck of mist, and the sun shining as through lambent crystal. After sunrise the astronomical observations were continued upon the sun, in order to detect the gradual changes in the optical quality of the atmosphere. At first, with the sun about half an hour high, there was very fine solar definition, with slight flickering of the limb, but little or no genuine "boiling." Rarely is the sun better seen. A crag of the crater wall was found whose shadow would, during the morning, fall at an accessible point within the cavity, several hundred feet away. Upon this crag was set a disk just a little larger than necessary to occult the sun. At the proper point behind this disk the eye was placed, and, when the sun came in range, the corona was carefully looked for. The degree of atmospheric illumination immediately around the sun was surprisingly small, and the conditions for seeing the corona without an eclipse seemed in every way favorable; but not a trace of it could be detected. There was still enough atmospheric and other matter above the mountain-summit to catch the sunlight and to render the background of the corona as bright as the object itself, and thus make it invisible. There is, of course, very little reason for expecting to see the corona in this way, but so simple an experiment seems always worth trying.

The usual unpleasant effects of the direct rays of the sun upon the complexion were not escaped by all of the party, and the skin of several faces gradually peeled off. Mountaineers often maintain that snow-reflection is the cause of this well-known trouble; but such could not have been the case here, as there

<sup>1</sup> The low temperature generally prevalent on Fuji-san is at one spot slightly modified by the intrinsic heat of the mountain. Satow and Hawes, without whose admirable "Guide-book to Northern and Central Japan" no one should attempt extended travel in the empire, say, at page 118, of the ascent of Fuji-san:

"The interesting phenomenon may be observed of steam still issuing from the soil in several places. . . . A few inches below the surface the heat is great enough to be unbearable, and an egg may be fairly cooked in about half an hour."

DRAWN BY HARRY FENN, FROM A PHOTOGRAPH.

FUJI-SAN FROM OMIYA.

ENGRAVED BY H. E. SYLVESTER.

was no snow on the mountain, except in protected gorges in the farther side of the crater half a mile away.

As the sun ascended higher toward meridian, the telescopic definition grew somewhat worse, but it never became so bad as at sea-level. The vast ocean of cloud below gradually rose as the morning advanced, and about noon the great mountain seemed entirely immersed. Celestial observations being no longer possible, we addressed ourselves to the task of locating the future observatory, should one ever be built on Fuji-san. A short distance northwest of Chodjo we discovered a fine plateau which with little labor might be enlarged for the reception of a permanent structure. Here the lesser apparatus and the observers' quarters might be established, there being ample means of protection against the severe and prevalent west winds. This point commands an incomparable view to the north and east, and communication by heliotrope with any of the towns below would be simple. If a great telescope were to be mounted on Fuji-san, an ideal

location is available on a saddle inside the crater, a few yards below the summit, where the buildings might be perfectly protected against the wind. Many advantages of a high-level observatory on Fuji-san are not realizable elsewhere. For a period of four or five months each year, the continual ascent of the mountain by pilgrims would make it possible to communicate directly with the world below. Furthermore, the keepers of a dozen or more huts at the tenth station are always living there during the season, and the little company of observers would never be quite alone. On no other isolated peak of like elevation on the globe would these advantages be gained. If, as often occurs, the series of high-level observations requires a corresponding series at a lower level, Fuji-san meets such conditions perfectly. For example, at Subashiri and on the summit might be established a pair of stations, each plainly visible from the other, with a vertical difference of nearly 10,000 feet and a horizontal distance of about seven miles.

While scientific men are supposed to be ob-

livious to discomfort in their surroundings, those who follow in their train sometimes preserve a few of the natural instincts unaltered. The strain of longer stay in that abomination of desolation was getting too great to bear. In spite of enthusiasm over the limpid air only occasionally thickened by passing clouds, blinding headache and a pulse above a hundred for more than forty-eight hours had made life a burden. There were those among us who bade

seemed impossible that this loveliest of walks could so soon be over; we could not see enough of the sweetness of verdure after the hopeless barrenness of Fuji's lonely peak. But the tea-house where horses are allowed to come was already reached, and we mounted the cumbersome pack-saddles, made softer by quilts strapped upon them. Jogging peacefully onward, noting the multitude of new and lovely wild-flowers on every side, we gradually

a glad farewell to that frowning peak, plunging joyfully into the yielding lava of the downward path. From that unique summit the kingdoms of the earth and their glory lay spread out to the gaze, but too far, too foreign, too remote, for companionship or sympathy. Grandeur and majesty, with desolation and loneliness unspeakable, form the crown of Fuji-san.

After descending two or three thousand feet, headaches disappeared suddenly, our heartbeats ceased their abnormal rush, and the heaviness in every motion turned into a renewed delight in life. On we plunged through the soft lava, aided by our long sticks, and with fresh pairs of straw-sandals over our boots every ten or fifteen minutes. The mist was very thick; the coolies in front and those behind became invisible; the dull thud of their approaching footsteps was a positive relief from the sensation of weird isolation, and even more so their dim shadows slowly growing into recognizable figures. The enthusiasm of delight in reaching vegetation at last can never be forgotten. The hardy little white and pink flowers which followed the cinders far up the height were welcomed as an advance-guard of joy; we could hardly pass by the oases of verdure with their sweet wild strawberries, and when we reached the trees it was like a region enchanted. It

emerged from the cloud, and its last traces floated calmly off above us, leaving a wide and sunny landscape, which even the volcanic soil could not render dreary. But long before we reached Subashiri the great triangular shadow of Fuji began to spread over the hills and fields. Growing larger and more portentous with every moment, it swept irresistibly onward, until we too became enshrouded in its veil, and as we rode along the one street to the Yona-yama, night was already come.

Once more in the same little rooms as before, with the *hibachi* full of red-hot coals set near, and the chicken and rice well under way for dinner, life had few unsatisfied desires. Warmth, comfort, ease of breathing, had acquired a new significance.

When, many days after this climb and descent, we steamed slowly at evening out of the beautiful bay of Yokohama, Fuji graciously vouchsafed a glorious parting glimpse of his majesty. Deep purple against a yellow sky, his regular, matchless cone rose solitary and superb over a foreground of coast-bluffs, and water rippling with sunset fire. Insensible, calm, unmoved by homage or effort, he lives his vast, pulseless life—the mighty landmark of all Japan.

Mabel Loomis Todd.  
David P. Todd.

## SEA-LONGINGS.

HE first world-sound that fell upon my ear  
Was that of the great winds along the coast  
Crushing the deep-sea beryl on the rocks—  
The distant breakers' sullen cannonade.  
Against the spires and gables of the town  
The white fog drifted, catching here and there  
At over-leaning cornice or peaked roof,  
And hung — weird gonfalons. The garden walks  
Were choked with leaves, and on their ragged biers  
Lay dead the sweets of summer — damask rose,  
Clove-pink, old-fashioned, loved New England flowers.  
Only keen salt sea-odors filled the air.  
Sea-sounds, sea-odors, these were all my world.  
Hence is it that life languishes with me  
Inland ; the valleys stifle me with gloom  
And pent-up prospect ; in their narrow bound  
Imagination flutters futile wings.  
Vainly I seek the sloping pearl-white sands  
And the mirage's phantom citadels  
Miraculous, a moment seen, then gone,  
Bastion and turret crumbled into air !  
Among the mountains I am ill at ease,  
Missing the stretched horizon's level line  
And the illimitable restless blue.  
The crag-torn sky is not the sky I love,  
But one unbroken sapphire spanning all ;  
And nobler than the branches of a pine  
Aslant upon a precipice's edge  
Are the strained spars of some great battle-ship  
Plowing across the sunset. No bird's lilt  
So takes me as the whistling of the gale  
Among the shrouds. My cradle-song was this,  
Strange, inarticulate sorrows of the sea,  
Blithe rhythms upgathered from the sirens' caves.  
So have I coastwise longings evermore.  
May the last sound that lingers on my sense —  
Save that of one low voice which not to hear  
Were death itself — be some sea-message blown  
Over the dim salt-marshes on the winds  
At dusk, or when the red autumnal dawn  
Turns all the pools and willow-stems to gold.

*Thomas Bailey Aldrich.*

LA CHASSE-GALERIE.

ENGRAVED BY J. W.

# LA CHASSE-GALERIE.<sup>1</sup>

By the Author of "Le Vieux Montréal," etc., etc.

WITH PICTURES BY HENRI JULIEN.

I.

WELL, then, since you seem to desire it so very much, I will tell you a roarin' story that ought to be a lesson to all of you. If there is among the crowd any renegade who intends to run *la chasse-galerie* or the *loup-garou*, he had better skip and go outside to see whether the owls are screeching in the storm, in converse with Old Nick himself, because I intend to begin my story by making a big sign of the cross. That will be a regular set-back to *le diable*, who always tries, at this time, to snatch a poor shantyman's soul by promising him all kinds of nonsense. I have had enough of that in my young days to understand his tricks."

Not a man moved. On the contrary, all gathered closer round the fireplace, where the cook had dragged the provision-chest, and upon which he had taken his seat on a camp-stool, preparatory to relating his experience under the wiles of the *mauvais esprit*.

It was on New Year's eve of the year 1858, in the depth of the forest, in the Ross timber camp, at the head of the Gatineau River. The winter had fairly set in, and the snow outside had already piled up to the roof of the shanty. The boss, according to custom, had ordered the distribution of the contents of a small barrel of Jamaica rum among the men, and the cook had terminated early his preparations of a succulent *ragout* of pigs' feet and of a large tin full of *glissantes* for the New Year's dinner. A big kettle, half full of molasses, was already simmering on the fire, as there was to be a candy-pull to finish the evening's entertainment.

Every man had filled his pipe with good, strong Canadian tobacco, and a thick cloud of smoke darkened the interior of the shanty. A few pine-branches thrown at intervals on the fire produced a reddish glare that illuminated

the rude faces of the men with curious effects of *clair-obscur*.

Joe, the cook, was a homely little man who laughed at his own physical defects, and who did not take offense when his comrades chaffed him on the subject, and called him *le bossu*, the hunchback. He had worked in the shanties for the last forty years, and his experience was only equaled by the facility with which he could relate his adventures when he had taken a glass of *bonne vieille Jamaïque*.

"I was telling you," said Joe, "that I was a *pendard* in my youth, but it is long since I mended my ways, and now I never joke about religious matters. I go to confession regularly every year, and what I am about to relate took place years and years ago, when I feared *ni Dieu, ni diable*. It was on a night like this, a New Year's eve, thirty-four or thirty-five years ago. Gathered round the fireplace with all the *camarades*, we made merry; and if it is true, as we say in French, that 'small rivulets make large rivers,' it is just as true that small drinks empty large barrels. And in those days, people drank more than to-day, and evenings of this kind generally ended in a boxing-match, outside, in the snow. The *rhum* was no better than it is to-night, but it was *bougrement bon*, I can assure you. I will be frank with you and tell you that about eleven o'clock my head began to feel dizzy, and I lay down on my buffalo-robe to take a nap, while waiting for the midnight jump that we always take over the head of a pork-barrel, from the old year into the new one. We will repeat the same thing to-night before we go to visit the neighboring camps to wish them the compliments of the season.

II.

"I HAD slept for quite a while, when I was rudely awakened by a second boss, Baptiste Durand, who said to me: 'Joe, it is past mid-

tively that he had seen bark canoes traveling in mid-air, full of men paddling and singing away, under the protection of Beelzebub, on their way from the timber camps of the Ottawa to pay a flying visit to their sweet-hearts at home.

It is hardly necessary to apologize for having used in the narrative expressions typical of the rude life and character of the men whose language and superstition it is the intention of the writer to portray.

<sup>1</sup> This narrative is founded on a popular superstition dating back to the days of the *coureurs des bois*, under the French régime, and perpetuated among the voyageurs in the Canadian Northwest. The shanty-men of a later date have taken up the tradition, and it is in the French settlements, bordering the St. Lawrence River, that the legends of *la chasse-galerie* are specially well known at the present time. The writer has met many an old *voyageur* who affirmed most posi-

night, and you are late for the barrel-jump. The *camarades* have gone to the other camps, and I am going to Lavaltrie to see my sweetheart. Will you come with me?’

“‘To Lavaltrie,’ said I, ‘are you crazy? We are three hundred miles away from there, and you could not travel the distance in two months, through the forest, when there are no roads beaten in the snow. And what about our work the day after to-morrow?’

“‘*Imbécile!* don’t you understand me? We will travel in our bark canoe, and to-morrow morning at six o’clock we will be back here for breakfast.’

“I understood. Baptiste Durand proposed that I should join him and run *la chasse-galerie*; risk the salvation of my soul for the fun of going to give a New Year’s kiss to my *blonde* at Lavaltrie. That was a little too much for me. It was true that I was a *mauvais sujet*, that I did not practise *la religion*, and that I took a drink too much now and then; but between that and the fact of selling my soul to *le diable* there was a big difference, and I said: ‘No, siree! *Pas un tonnerre!*’

“‘Oh, you are a regular old woman,’ answered Baptiste tauntingly. ‘There is no danger whatever. We can go to Lavaltrie and back in six hours. Don’t you know that with *la chasse-galerie* we can travel 150 miles an hour, when one can handle the paddles as well as we all do. All there is to it is that we must not pronounce *le nom du bon Dieu* during the voyage, and that we must be careful not to touch the crosses on the steeples when we travel. That’s easy enough, and, to be all right, all a man has to do is to look where he goes, think about what he says, and not touch a drop of liquor on the way. I have made the trip five times, and *le diable* has not got me yet. Come, *mon vieux*, stiffen up your courage, and in two hours we will be at Lavaltrie. Think of Liza Guimbette, and the pleasure you will have in kissing her “a happy New Year.” There are already seven of us to make the trip, but we must be two, four, six, or eight, to make up the crew of the canoe.’

“‘Yes, that’s all right, but you must make an engagement with *le diable*, and he is not the kind of a *bourgeois* that I want to make any bargain with.’

“‘A simple formality if we are careful where we go and not to drink. A man is not a child, *pardieu!* Come on! The *camarades* are waiting outside, and the canoe is already in the clearing. Come, come!’

“And I was led outside of the shanty, where I saw the six men who were awaiting us, paddle in hand. The large canoe was lying on a snowbank, and before I had time to think twice about it, I was seated in the bow, awaiting the

signal to go. I must say that my mind was somewhat confused, but Baptiste Durand, who was a hard customer,—for, it was said, he had not been to confession for seven years,—gave me no time for reflection. He was standing in the stern, and exclaimed in a ringing voice:

“‘Are you ready?’

“‘Ready.’

“‘Repeat after me.’

“‘And we repeated together:

“‘*Satan!* king of the infernal regions, we promise to sell you our souls, if within the following six hours we pronounce *le nom du bon Dieu*, your master and ours, or if we touch a cross on the voyage. On that condition you will transport us through the air, wherever we may want to go, and bring us back sound and safe to the shanty. *Acabris, Acabras, Acabram!* *Fais nous voyager par-dessus les montagnes!*’

### III.

“THE last words were hardly pronounced, when we felt the canoe rising in the air to a height of five or six hundred feet. I felt as light as a feather, and at Baptiste’s command, we commenced paddling like sorcerers that we were. At the first stroke of the paddle the canoe shot out like an arrow, and off we went under the protecting wing of *le diable* himself. It fairly took my breath away, and I could hear the bow of the canoe whizzing through the crisp air of the night.

“We went faster than the wind, and during the first fifteen minutes we sailed over the forest, without perceiving anything else than the dark heads of the great pines. It was a beautiful night, and a full moon lighted up the sky like the midday sun. It was terribly cold though, and our mustaches were fairly frozen, while our bodies were all in a perspiration. We were paddling like demons at work in the lower regions. We soon perceived a bright, glistening belt of clear ice, that shone like a mirror. That was the Gatineau River; and then the lights in the farm-houses, which were mostly lit up on New Year’s eve. We began passing the tin-covered steeples as quickly as telegraph-poles fly past in a railway-train, and the spires shone in the air like the bayonets of the soldiers drilling on the Champ de Mars, in Montréal. On we went like *tous les diables*, passing over forests, rivers, towns, villages, and leaving behind us a trail of sparks. It was Baptiste Durand, the *possédé*, who steered the canoe because he knew the route, and we soon came to the Ottawa River, which we followed down to the *Lac des Deux Montagnes!*

“‘Look out there,’ said Baptiste; ‘we will just skim over Montréal and frighten some of the fellows who may be out at this hour of the

night. Joe, clear your whistle and get ready to sing your best canoe-song, "*Canot d'écorce*," my boy.'

"The excitement of the trip had braced me up, and I was ready for anything. Already we could see the lights of the great city, and with an adroit stroke of his paddle, Baptiste brought us down on a level with the summit of the towers of Notre-Dame. I cleared my throat and sang '*Canot d'écorce*,' while my *camarades* joined heartily in the chorus.

" 'Mon père n'avait fille que moi,  
Canot d'écorce qui va voler,  
Et dessus la mer il m'envoie :  
Canot d'écorce qui vole, qui vole,  
Canot d'écorce qui va voler !' etc.

## IV.

"ALTHOUGH it was well on toward two o'clock in the morning, we saw some groups of men who stopped in the middle of the street to watch us go by, but we went so fast that in a twinkle we had passed Montréal and its suburbs. We were nearing the end of our voyage, and we commenced counting the steeples,—Longue Pointe, Pointe-aux-Trembles, Repentigny, St. Sulpice,—and at last we saw the two shining spires of Lavaltrie that gleamed among the dark-green pines of the domain.

" 'Look out over there !' shouted Baptiste. 'We will land on the edge of the wood, in the field of my godfather, Jean-Jean-Gabriel. From there we will proceed on foot to go and surprise our acquaintances in some *fricot* or dance in the neighborhood.'

"We did as directed, and five minutes later our canoe lay in a snowbank, at the edge of the wood of Jean-Jean-Gabriel. We started in Indian file to go to the village. It was no small job, because the snow reached to our waists and there was no trace of any kind of a road. Baptiste, who was the most daring of the crowd, went and knocked at the door of his godfather's house, where we could see a light, but there was no one there except a servant, who told us that the old folks had gone to a *snague* at old man Robillard's place, and that the young people of the village—boys and girls—were across the St. Lawrence at Batissette Augé's, at the *Petite Misère*, below Contreccœur, where there was a New Year's hop.

" 'Let us go to the dance at Batissette Augé's,' said Baptiste; 'we are sure to find our sweet-hearts over there.'

" 'Let us go to Batissette Augé's !'

"And we returned to our canoe, while cautioning one another against the great danger that there was in pronouncing certain words, in touching anything in the shape of a cross, and especially in drinking liquor of any kind.

We had only four hours before us, and we must return to the shanty before six o'clock in the morning, if we wanted to escape from the clutches of Old Nick, with whom we had made such a desperate bargain. And we all knew that he was not the kind of a customer to let us off, in the event of any delay on our part.

" '*Acabris, Acabras, Acabram ! Fais nous voyager par-dessus les montagnes !*' shouted Baptiste once more.

"And off we went again, paddling through the air, like renegades that we were, every one of us. We crossed the river in less time than it requires to tell it, and we descended in a snow-bank close to Batissette Augé's house, where we could hear the laughter of the dancers, and see their shadows through the bright windows.

"We dragged our canoe on the riverside, to hide it among the hummocks produced by the ice-shove.

" 'Now,' said Baptiste, in a last warning, 'no nonsense ! Do you hear ? Dance as much as you can, but not a single glass of rum or whisky. And at the first sign, follow me out without attracting attention. We can't be too careful !'

"And we went and knocked at the door.

## V.

"OLD Batissette came and opened the door himself, and we were received with open arms by the guests, who knew us all.

" 'Where do you come from ?'

" 'I thought you were in the *chantiers*, up the Gatineau ?'

" 'What makes you come so late ?'

" 'Come and take a smile.'

"Baptiste came to the rescue by saying : 'First and foremost, let us take our coats off, and give us a chance to dance. That's what we came here for, and if you still feel curious in the morning, I will answer all your questions.'

"For my part, I had already spied Liza Guimbette, who was chatting away with little Boisjoli of Lanoraie. I made my *révérence* in due style, and at once asked for the favor of the next dance, which was a four-handed reel. She accepted with a smile that made me forget that I had risked the salvation of my soul to have the pleasure of pressing her soft white hand in mine and of cutting pigeonwings as her partner. During two hours the dancing went on without stopping, and, if I do say so myself, we shanty fellows cut a shine in the dance that made the hayseeds tired before morning. I was so busy with my partner that at first I did not notice that Baptiste was visiting the *buffet* rather often with some of the other boys, and once I caught him lifting his elbow in rather a suspicious manner. But I had

no idea that the fellow would get tipsy, after all the lecturing he had given us on the road. When four o'clock struck, all the members of our crew began to edge out of the house without attracting attention, but I had to drag Baptiste before he would consent to go. At last we were all out, with just two hours before us to reach the camp, and three hundred miles to ride in our canoe, under the protection of Beelzebub. We had left the dance like wild Indians without saying good-by to anybody, not even to Liza Guimbette, whom I had invited for the next *cotillon*. I always thought that she bore me a grudge for that, because when I reached home the next summer she was Madame Boisjoli.

"We found our canoe all right in the hummocks, but I need hardly tell you that we were all put out when we found that Baptiste Durand had been drinking. He was to steer the boat, and we had no time to lose in humoring the fancies of a drunken man. The moon was not quite so bright as when we started from the camp, and it was not without misgivings that I took my place in the bow of the canoe, well decided to keep a sharp lookout ahead for accidents. Before starting I said to Baptiste:

"Look out, Baptiste, old fellow! Steer straight for the mountain of Montréal, as soon as you can get a glimpse of it."

"I know my business," answered Baptiste sharply, "and you had better mind yours."

"What could I do? And before I had time for further reflections:

"*Acabris! Acabras! Acabram! Fais nous voyager par-dessus les montagnes!*"

## VI.

"AND up we went again like lightning, steering southwest, if the wild way in which Baptiste managed our boat could be called steering. We passed over the steeple of the church at Contrecoeur, coming pretty close to it, but instead of going west Baptiste made us take a sheer toward the Richelieu River. A few minutes later we were skimming over Belceil Mountain, and we came within ten feet of striking the big cross that the Bishop of Quebec planted there, during a temperance picnic held a few years before by the clergy of his diocese.

"To the right, Baptiste! steer to the right, or else you will send us all to *le diable* if you keep on going that way."

"And Baptiste did instinctively turn to the right, and we steered straight for the mountain of Montréal, which we could perceive in the distance by the dim lights of the city. I must say that I was becoming frightened, because if Baptiste kept on steering as he had done, we would

never reach the Gatineau alive, and *le diable* was probably smacking his lips, as I supposed, at the bare idea of making a New Year's mess of us. And I can tell you that the disaster was not long in coming. While we were passing over the city, Baptiste Durand uttered a yell, and, flourishing his paddle over his head, gave it a twist that sent us plunging into a snow-drift, in a clearing on the mountain-side. Luckily the snow was soft, and none of us were hurt, nor was the canoe injured in any way. But Baptiste got out and declared most emphatically that he was going down-town to have un *verre*. We tried to reason with him, but our efforts proved useless, as is generally the case with *les ivrognes*. He would go down if *le diable* himself were to catch hold of him on the way. I held a moment's consultation with *mes camarades*, and, before Baptiste knew what we were about, we had him down in the snow, where we bound him hand and foot so as to render him incapable of interfering with our movements. We placed him in the bottom of the canoe, and gagged him so as to prevent him from speaking any words that might give us up to perdition.

"And '*Acabris! Acabras! Acabram!*' up we went again, this time steering straight for the Gatineau. I had taken Baptiste's place in the stern. We had only a little over an hour to reach camp, and we all paddled away for dear life and eternal salvation. We followed the Ottawa River as far as the Pointe-Gatineau, and then steered due north by the polar star for our shanty. We were fairly flying in the air, and everything was going well when that rascal of a Baptiste managed to slip the ropes we had bound him with and to pull off his gag. We had been so busy paddling that, the first thing we knew, he was standing in the canoe, paddle in hand, and swearing like a pagan. I felt that our end had come if he pronounced a certain sacred word, and it was out of the question to appease him in his frenzy. We had only a few miles to go to reach camp, and we were floating over the pine forest. The position was really terrible. Baptiste was using his paddle like a shillalah and making a *moulinet* that threatened every moment to crush in some one's head. I was so excited that by a false movement of my own paddle I let the canoe come down on a level with the pines, and it was upset as it struck the head of a big tree. We all fell out and began dropping down from branch to branch like partridges shot from the tamarack-tops. I don't know how long I was coming down, because I fainted before we reached the snow beneath, but my last recollection was like the dream of a man who feels himself dropping down a well without ever reaching bottom.

THE DANCE AT BATTISSETTE AUGÉ'S.

ENGRAVED BY F. N. WELLINGTON.

## VII.

"ABOUT eight o'clock the next morning, I awoke in my bunk, in the cabin, whither some of our *camarades* had conveyed us after having found us to our necks in a neighboring snow-bank, at the foot of a monster pine-tree. Happily, no one was seriously hurt, although we were all more or less bruised and scratched, some having secured even black eyes in our way down from the tree-top. We were all thankful that nothing worse had befallen us, and when the *camarades* said that they had found us sleeping away in the snow the effects of the previous night's frolic, not one of us had anything to say to the contrary. We all felt satisfied that our *escapade* with Old Nick remained unknown in the camp, and we preferred leaving our chums under the impression that we had taken *un verre* too many, to telling them of the bargain we had made to satisfy a passing fancy. So far as Baptiste Durand was con-

cerned, there is no doubt that he had forgotten the latter part of his voyage, but he never alluded to the fact, and we followed his example. It was not till many years afterward that I related the story of our *aventures*, just as they happened on that memorable New Year's eve.

"All I can say, my friends, is that it is not so amusing as some people might think, to travel in mid-air, in the dead of winter, under the guidance of Beelzebub, running *la chasse-galerie*, and especially if you have *un ivrogne* to steer your bark canoe. Take my advice, and don't listen to any one who would try to rope you in for such a trip. Wait until summer before you go to see your sweethearts, for it is better to run all the rapids of the Ottawa and the St. Lawrence on a raft, than to travel in partnership with *le diable* himself."

And Joe, the cook, dipped a ladleful of boiling molasses from the big kettle on the fire, and declared that everything was now ready for the candy-pull.

*Honoré Beaugrand.*

## A SERVIAN SONG.

"MOTHER, a dear little lad  
Alone through the night is creeping:  
He has lost his way, and is sad;  
I hear him bitterly weeping.  
I know he is coming to me:  
Go to the door and see."

"Daughter, woman's undoing  
Is to be won without wooing.  
When she meets her lover half-way,  
He holds her favor light  
As the cup he drains by day,  
Or the lamp he burns at night."

"Mother, no more,  
But open the door:  
I have his heart, he mine;  
He must be housed and fed:  
I will give him kisses for wine,  
And my eyes shall light him to bed!"

*R. H. Stoddard.*

# A SEA CHANGE

JUST at this full noon of summer  
There 's a touch, unfelt before,  
Charms our Coastland, smoothing from her  
The last crease her forehead wore :  
She, too, drains the sun-god's potion,  
Quits her part of anchorite,  
Smiles to see her leaden ocean  
Sparkle in the austral light ;

While the tidal depths beneath her  
Palpitate with warmth and love,  
And the infinite pure æther  
Floods the yearning creek and cove,  
Harbor, woodland, promontory,  
Swarded fields that slope between,—  
And our gray tower, tinged with glory,  
Midway flames above the scene.

On this day of all most luring,  
This one morn of all the year,  
Read I — soul and body curing  
In the seaward loggia here —  
Once, twice, thrice, that chorus sweetest  
(Fortune's darling, Sophokles!)  
Of the grove whose steeds are fleetest,  
Nurtured by the sacred breeze ;

Of Kolonos, where in clusters  
    Blooms narcissus — where unfold  
Ivied trees their leafy lusters  
    And the crocus spreads its gold ;  
Where the nightingales keep singing  
    And the streamlets never cease,  
To the son of Laius bringing  
    Rest at last, forgiveness, peace.

Drops the book — but from its prison  
    Tell me now what antique spell,  
Through the unclaspt cover risen,  
    Moves the waves I know so well ;  
Bids me find in them hereafter,  
    Dimpled to their utmost zone  
With the old innumerable laughter,  
    An Ægean of my own ?

Even so: the blue Ægean  
Through our tendriled arches smiles,  
And the distant empyrean  
Curves to kiss enchanted isles:  
Isles of Shoals, I know—yet fancy  
This one day shall have free range,  
And yon isles her necromancy  
Shall to those of Hellas change.

Look! beyond the lanterned pharos  
Girt with reefs that evermore,  
Lashed and foaming, cry "Beware us!"  
Cloud-white sails draw nigh the shore:  
Sails, methinks, of burnished galleys  
Wafting dark-browed maids within,  
From those island hills and valleys,  
Dread Athene's grace to win.

Sandaled, coiffed, and white-robed maidens,  
Chanting in their carven boats;  
List! and hear anon the cadence  
Of their virginal fresh notes.  
You shall hear the choric hymnos,  
Or some clear prosodion  
Known to Delos, Naxos, Lemnos,  
Isles beneath the eastern sun.

'T is the famed Æolian quire  
Bearing Pallas flowers and fruit —  
Some with white hands touch the lyre,  
Some with red lips kiss the flute;  
You shall see the vested priestess,  
Violet-crowned, her chalice swing,  
Ere yon cerylus has ceased his  
Swirl upon "the sea-blue wing."

In the great Panathenæa  
Climbing marble porch and stair,  
Soon before the statued Dea  
Votive baskets they shall bear,  
Sacred palm, and fragrant censer,  
Wine-cups —  
But what vapor hoar,  
What cloud-curtain dense, and denser,  
Looms between them and the shore?

Off, thou Norseland Terror, clouding  
Hellas with the jealous wraith  
Which, the gods of old enshrouding,  
Froze their hearts, the poet saith!  
Vain the cry: from yon abysm  
Now the fog-horn's woeful blast —  
Stern New England's exorcism! —  
Ends my vision of the past.

*Edmund Clarence Stedman.*

# THE COLONEL'S LAST CAMPAIGN.

BY THE AUTHOR OF "MR. CUTTING, THE NIGHT EDITOR."

WITH PICTURES BY C. D. GIBSON.

"HE PROMENADED THE LONG VERANDAS, DÉBUTANTES LEANING ON HIS ARM."

"I SUPPOSE," said Major Hardservice one day to his wife, when their daughter Eleanor, seven years old, was looking into a mirror and tossing her bright curls vainly, "that Nellie will marry a rich man."

"Oh, yes, indeed," said little Mrs. Harde-

service with a touch of pride. "Nellie will be very handsome, like you, Frank — straight and tall and fair."

Major Hardservice had been straight and fair, and he was still handsome, with a firm and almost dashing carriage; but several years of service on the frontier under a burning sun, where in summer the hot air, from whatever direction it blew, came over a dazzling white plain, had turned a fair complexion to a permanent red. The Major's uniform, too, measured several inches more around the belt than when, as a slender lieutenant, he had assisted Miss Elizabeth Marwin to change her name. No doubt if a blush could have vied with his high color, his wife would have seen that the Major was pleased, for he was proud of his good looks, and Eleanor might have inherited her father's vanity.

"But Bess," said the big soldier, pulling a little dark-eyed creature up to his broad knee, and pressing a heavy mustache against the soft cheek, "will marry for love, dear. And she'll make a good wife for a fortuneless soldier like me. She is like her mother."

The hot winds of the desert, and the blinding glitter of snow on crusted fields, had not spoiled the delicacy of Mrs. Hardservice's cheek, and her blush was evident enough. It was such a pretty blush that the Major heightened it with his lips, and then went stalking out so heavily that the weight of his boots on the board walk could be heard until he reached the parade-ground.

In this way it came about that the family always thought and spoke of Eleanor as the future wife of some man whose fortune could be measured only by the beauty of his wife. That such a man would be worthy there never was any doubt.

But this was almost twenty years before the summer when Colonel and Mrs. Hardservice and the Misses Hardservice were spending the summer at Bar Harbor.

The pretty Eleanor, when she was fifteen years old (she did not deny three months later that she was sixteen), had been sent East to her Aunt Helen to receive in New York the social education befitting a rich man's wife. At that time she was as vain and as coquettish as any young girl who is pretty and fully aware of her beauty.

When little Bess, out on the withered stretches of Colorado, read her sister's letters about New York, she thought Eleanor a very fine lady, for Bess's big eyes had seen as yet only forts, and soldiers, and army officers who petted her, and big, square houses as hideous as dull-red paint could make them.

On the night when Miss Eleanor was "to come out," there was an additional military

erectness to the Major's figure over two thousand miles away from New York. Mrs. Hardservice was in as much of a flutter as if she herself were that night to make a pretty courtesy to full-fledged society. Bess, now fourteen, was in an ecstatic dream in which magnificent gowns, and wonderful music, and oppressively fragrant flowers set her head in a wild whirl. The sentry who paced out the dark night near the Major's quarters wondered at the lateness of the hour when the last light in the officer's house went out.

After this came long letters of afternoon teas, receptions, dinner-parties, cotillions, and countless other entertainments, so that Bess lay awake at night and pictured dukes and royal princes kneeling before Nell, while glittering palaces and fairy gardens danced before her eyes. She was a little disappointed when she received a photograph on the back of which was written, "To my dearest Bess, from her sister in her coming-out gown." Bess had expected to see a crown on the grand lady's head, whereas she was dressed very simply in white. But she was a very beautiful woman, and Mrs. Hardservice looked at the picture many times that day.

Bess had gone to bed when Mrs. Hardservice, looking at the Major as she spoke to him of Eleanor, saw that he was dozing. His hand was clenched around a newspaper so that the edges had split. She went up to him with tears in her eyes, and threw her arms around his neck.

"Frank," she said, half sobbing, "I want her."

The Major sprang to his feet. His arm shot out, his finger pointing steadily.

"I can march it in thirteen hours!" he cried, and then rubbed his eyes. "Nell, dear," he added with a short laugh, as if he were ashamed, "I have been fighting Indians again." He looked regretful to find himself in post instead of in the field. She was crying softly to herself when she went up-stairs.

Eleanor was twenty, and her father was a colonel, when his horse, carrying him over the plain at a hard gallop, plunged a leg into a prairie-dog's hole. The heavy Colonel was carried home white and limp, and *Cæsar*, the horse, was shot to end his suffering. The Colonel lay in bed for three months, and then went on the retired list. The family moved East, and after living in New York for a few months found a quiet little home in Mount Vernon, where the Colonel read the military publications, and army and navy notes in the newspapers — and fretted.

As for Eleanor, she had grown a wonderfully beautiful woman, and her triumphs were many. She was then tall and slender, with shoulders

which marked her spirit and pride. She held them up and back, and when she shrugged them it was like the gesture of a woman who ruled a people. Her throat and neck were marvelously beautiful. They were soft, and yet there was strength in them. Her head was firmly poised, and the hues of her hair were radiant. When she was pleased her eyes, and lips, and every curve of her features, smiled. When she was indifferent her face was like white marble.

Her winters were spent in New York with her aunt, and though no one doubted that she was, as the newspapers spoke of her, a "reigning belle," she did not get married. Not that she had no opportunities. There were hints without end in the publications that balance the accounts of society's ledgers. The smart young men who dawdled on the outer circles of her admirers could tell who was going to marry her. Sometimes they let slip the secret; sometimes they declared that they could not betray honorable confidences. There were mothers of daughters who frowned when desirable men followed in the haughty Miss Hardservice's train. There were mothers of light-headed young men, possessed of ample fortunes, who trembled at the same time. And yet Miss Hardservice did not get married. There was only one family that did not wonder at this. The Colonel was a little worried, for he was poor, but his serenity of mind never deserted him about his elder daughter's judgment. Mrs. Hardservice was content to have her daughter, if only during the summers, and Bess loyally scoffed at every man who offered his name and fortune to her sister. Bess saw a little of Eleanor's world. She stayed in it for one winter. She was not abashed, but after that she chose to remain at home, and while her sister danced gaily or impassively in the social whirl, got her name in the "society" columns daily, and gracefully repulsed young men who swore that they would shoot themselves if she did not marry them, Bess read the "Army and Navy Journal" to her soldier father while he indulged in stolen naps, unmindful of social strife or Indian wars.

When Miss Hardservice confessed to the Colonel one day, as her fingers played with his gray locks, that she was weary of it all, and begged him to take her to Bar Harbor on a family trip, where they could amuse one another, the Colonel, as he always did to every proposal of hers, cheerfully consented. He went to his desk, looked at his slender surplus in bank, wrinkled his brows a little, and made one more plunge into his account.

It was at Bar Harbor that Colonel Hardservice began and brilliantly closed his last campaign. While the family adhered strictly

to their plan of enjoying themselves very quietly and simply, it was not surprising that Eleanor should find at Bar Harbor friends who were unwilling to allow her to keep in the social background. But when it was proved after argument, pleadings, and protestations that she was determined in her resolve, her ardent friends did not force their admiration to the point of driving themselves into sympathetic retirement. Her father, valiant soldier that he was, stood before Eleanor. Her friends began to know him. They had not seen his like before. His candor, his freshness, his freedom from conventional restraint, and his fine, open self-reliance, nourished and ripened on frontier posts, caught the spirits of all who met him. It was then that the Colonel became a lion. He danced, he told stories of Western life, he promenaded the long verandas, débutantes leaning on his arm. Colonel Hardservice was the central figure of Bar Harbor, and in defending his daughter from her admirers and suitors he gave back to society not only Miss Hardservice, but her father.

The Colonel saw at first glance wherein Eleanor had been at fault. It was not true that there were no men who were her equals. There were many—too many. Only an old campaigner could pick from the flower of this army the most gallant and worthy captain. So while the Colonel conducted armies of young pedestrians up Newport Mountain, led dashing cavalry troops in buckboards over the island of Mount Desert, and watched social manœuvres with a critical eye, he searched carefully for his chief aide. In the flush of his victories he went beyond military operations. He planned a naval invasion of the dark-hued island which lay before his hotel. Seated in a fickle canoe managed by a young woman whose color was as fresh as the sea air,—the Colonel had never touched an oar or a paddle in his life,—he saw his fleet ground on the shore of the invaded land, and, standing up in his treacherous craft, gaily waved his straw hat and proclaimed the island a province of Mount Desert.

Those were joyous days for the Colonel. The eyes of the fashionable world were upon him. But he did not allow himself to forget his duty to Eleanor. His keen eye was always on the alert. The man whom he sought he soon found. At the same time he made a discovery which caused him, a father whose whole thoughts were devoted to the interest of his daughter, no little mental turmoil.

There were two men toward whom the Colonel's attention was drawn. He liked them both, and their admiration for him was shown in many ways. They were both wholly unlike the Colonel and wholly unlike each other. What made it hard for the Colonel to do his duty was

that his heart went out at the very start to the younger of the two women. And he was poor. He liked Alfred Strong because Strong reminded him of the army. He was bold, vigorous, impetuous, and a little intolerant. He spoke rapidly in an argument, almost nervously, but he talked well, for in his life as a newspaper man, from reporter to editor, he had seen a good deal of the world—"A good deal," he himself said, "which a man would be better for not seeing and knowing."

Philip Malcolm, Strong's friend, on the other hand, had never earned a penny in his life. He had been constantly in Miss Haradeservice's court for three years. He was rich, he was slow, and he was grave. The Colonel had great respect for his good sense. He decided that Malcolm was a most desirable son-in-law, and although he would have preferred Strong, he accepted the conditions, soldier-like, and was firm in his duty.

The striking difference between the two friends, Strong and Malcolm, was something like this:

"You are a lucky dog, Phil, to have your disposition," said Strong once, when Malcolm came up to the editorial rooms after a rambling trip abroad. "If I had your money, it would kill me. I should be chasing fancies from the north to the south pole. I could n't keep still, should get out of breath and run myself to death—die from heart-failure."

"I work just as hard in my way," Malcolm answered, "as you do. I am forced to amuse myself. That is the hardest work in the world. I'm not fit for real, honest work. You can make your own living. That ought to be satisfaction enough."

He turned his dark eyes to look after something that was beyond his reach.

"Paint! paint!" cried Strong. "You paint well. That last bit of yours was good. Every one says so. How long did it take you? Two years!" exclaimed the editor. "I should drive at a picture night and day, spoil it in no time, and smash the canvas on a chair. You have patience; paint and do something."

Malcolm smiled at his ardor. "My dear fellow," he said, "it is easy enough for you to say that. That feeling is part of you. But I am different, and I make the best of it." Nevertheless, he looked discontented.

What made the Colonel attached to Strong was the editor's iconoclastic way of smashing at things.

"A newspaper man," said Strong to him, "is a freak of nature. He is shut out from those things which most people regard as the best part of life. He should never get married, for instance. It is n't fair to his family. He is an independent slave—a slave so long as he

earns his living; independent when he starves. His whole self is put away, checked at the door, you might say, when he goes to his editorial desk. He gets no rest and no consideration, because every one around him lives at the same high tension, until he breaks down. Then there is a flurry. Every one is shocked. His paper sends him to Europe—can't do enough for him; but his nerves are gone. They are on so fine an edge that inactivity jars them. Look at me—thirty-five, a young man, and my paper has to exile me to Bar Harbor for the summer. I should not have lasted here a week," he added with a smile, "if you had not come along to cheer me up. It's frightfully dull and flat. When I was a reporter I could work thirty-six hours at a stretch without a wink of sleep or a bite to eat save a sandwich wherever I could grab it. I would then go home, sleep ten hours, eat a good breakfast, and report at the office, bright and smiling for another fast. Now—why, it would kill me now," he said with a laugh.

"A soldier, too," said the Colonel. "Just like us. But you would n't change it."

Strong leaned back in his chair and smiled into the keen old eyes of the soldier.

"No, I would n't," he said; "not for the world. I live on it. The excitement and stimulus of it would keep me alive."

"So it does; so it did with me," cried the Colonel, warmly. He wished that Strong were wealthy. "I would give—oh, it's all over with me now," he added gloomily.

After this talk Strong held first place in the Colonel's estimation.

Strong was on the veranda of the Colonel's hotel, talking with the veteran and Malcolm, when he first met Miss Haradeservice. She came walking up slowly from the water, a jacket trailing in her hand. There were then two small spots of color in her cheek, which looked brighter than they were above the white of her yachting-gown. It was after dinner, and the slanting sun sent shining flashes through her hair. When she sat down with them to rest, her several winters in New York showed in her face, for it became pale; but at times, as she talked, a touch of pink was in her cheek again.

"That color will refuse to come in two years more," said Strong to himself. He looked at her while he chatted with the little dark-eyed one, as he called the younger Miss Haradeservice.

"She is older than she looks," he thought. "Twenty-eight, or twenty-nine; no, twenty-eight." He wronged her by two years. After a while he drifted into conversation with her alone. It was perfectly aimless. He became

a trifle impatient with her. "She poses," he said mentally.

When he and Malcolm were walking to their hotel, he broke out suddenly, "She is handsome."

"Who is handsome?" said Malcolm.

"Why, Miss Haradeservice, of course." He knew all about Malcolm's suit, but he was very frank with his friend.

"I did n't like her mannerisms," Strong went on; "that is, I thought she assumed a weariness of some things. Perhaps she piqued my vanity by appearing to be a little bored. Is n't she just a bit of a coquette?" he blurted out.

"N—no, she is n't," answered Malcolm. "I once thought she was." He stopped for a minute. "But she is perfectly frank with men. I do not know of a single case where she has not been sincere."

"Well, I like the little one better," said Strong. "She is full of good sense, and she knows a deal. She rests me. She's calm and placid, like the water down there. Her sister is more like those straight trees up on the hill."

Malcolm gave him no answer.

"But I must say, Phil," Strong went on, "that I have never seen a more handsome woman. She carries herself superbly. She seems to be all that a man could picture to himself. If she would only feel! Do you know," he said earnestly, "I can't get it out of my head that she poses. Hang it, Phil!" he jerked out in his quick way, forgetting his friend, "I think that girl wants to marry money."

"I don't believe it," answered the other, quietly, looking up over the hill. "No; you will like her better. She is much like her father."

"He is a sterling old soldier and a fine gentleman," said Strong. "I like him. I like the little one. I think I like them all, but I like the Colonel best."

It did not take the Colonel long, with his fine perceptions, to discover that Strong was falling in love with his younger daughter. This complicated affairs, but it eased his mind, for he would have found it against his inclination to oppose the editor had he tried to win Eleanor. Now he had only to broaden his field of operations and to make use of his military talents in massing his forces or performing flank movements. So the Colonel's ruddy face beamed, and his heart was light; but this campaign was no easy one.

"My troops," he used to say when holding councils of war with himself, "are undisciplined. They have a tendency to lose their heads." And this was quite true, though perhaps not in the sense which the Colonel meant it. They rather bewildered him at times. The

forces were often thrown into utter confusion, so that he could not direct them all.

One of the difficulties was that Strong was impartial in his attentions. He was as uncertain as the wind. Malcolm's suit made little headway. It was impossible to tell whether he felt shy or hopeless.

There was also one phase of the situation which the commander-in-chief failed to take in: Strong and Malcolm were not so cordial to each other as they had been. This was scarcely the fault of Strong. He believed in a fair fight and the laurels to the victor. Malcolm, on the other hand, could not take up arms against a friend. He was never sure of his own position, and was even in more doubt about Strong. He was a shuttlecock on a battledore held by an irresponsible hand. If he went canoeing with Bess, it was because Miss Haradeservice and Strong were on the water together. If he found himself playing tennis with Miss Haradeservice for a partner, it was because Bess and Strong had already formed an alliance. Realizing this, Malcolm felt uncomfortable. But the Colonel was untiring in the use of his tactics, so that in the end he usually had the supreme satisfaction of seeing the battle wage as he wished. Then he would draw aloof and survey the field with a calm dignity and a soldier's pride. One could almost fancy him sweeping a plain with his field-glass. As he examined the war maps in his brain, his smile grew more eloquent and his face more ruddy.

One night, when he gave Bess a good-night kiss, he pinched her cheek affectionately, and looked down into her dark eyes with such a meaning glance that his daughter blushed furiously and ran away from him, involuntarily trying to hide her treacherous cheeks with her hands.

"Strong is in love with our Bess, dear," he said to his wife.

"I think he is, Frank," answered his wife, complacently.

"This has been known to me for some time," said the Colonel, nodding his gray head sagely.

"I don't think that Bess is very—fond of him," she answered, hesitating over the word.

"Don't you?" said he, with a mysterious smile. "He is just the husband for Bess, frank, brave, able, and—handsome," he added, looking at himself in a glass. "You are n't opposed to it, are you?" he asked anxiously.

"Not in the least. Bess will marry the man she loves. She could not be made to do otherwise. She has a great deal of spirit, only she seldom shows it."

"But she likes Strong."

"Yes, she does; but Bess is very shy. If she loved a man, she would be more likely to re-

treat from him. I should say that she was more likely to love Mr.—a man like—well, a man like Malcolm.”

“You don’t mean to say,” cried the Colonel, jumping up in alarm, “that—”

“Oh, dear, no,” cried little Mrs. Hardservice, frightened by her husband’s voice.

“What *do* you mean, then?” he asked in a relieved tone.

“I think that Mr. Strong is in love with Bess, that Mr. Malcolm has always been in love with Nell, but that such an idea never entered Bess’s little head, while Nell does n’t care for either of them. Nell seems to be tired of every one but us. She says that she is going to spend the winter at home. She has written to her aunt, and Helen is greatly vexed about it.”

“My dear,” said the Colonel, smoothing his ruffled dignity, “you should see with my eyes. Nell will be engaged to Malcolm before we leave this place.”

“Never mind, Frank,” answered his wife, gently; “it will all come out right.”

“How blind women are!” reflected the son of Mars; and he smiled serenely.

PERHAPS Strong and Malcolm first confessed to themselves that their relations were a little strained on the evening when they just escaped a serious accident. They were out canoeing with the two sisters. Strong managed a canoe with fine skill. His boat was a mere shell, and his quick arms drove it through the still water like a knife-blade. It was as delicately poised as a spinning bicycle-wheel, and Strong, with another person in the craft, could keep it at all times on a perfect balance. He and the younger Miss Hardservice were shooting about on the water before the island, while Malcolm and Miss Hardservice, in a much heavier boat, were following in their wake. Strong wheeled his frail craft around in a pretty half-circle, a streak of white behind them showing their course. Then with a long sweep of his arm, showing brown and sinewy where his sleeves were up-rolled, he sent the canoe skimming over the water, and drew in his paddle. This circular course brought them nearer Malcolm and Miss Hardservice. Strong and the younger sister watched the water drip from the shining paddle as they drifted.

Malcolm was propelling his heavy canoe vigorously, and his boat promised to cross Strong’s bows. He seemed a little excited. Miss Hardservice’s back was toward them, and she held her glove up where the sun touched her cheek.

They were not twenty yards away, and would cross very near the light canoe, when suddenly Malcolm’s paddle stopped as he leaned forward saying something earnestly; his boat swerved,

and came straight toward the other canoe. Strong’s paddle was lying across his lap.

“Look out, Phil!” he shouted, as he seized it, and thrust it into the water; “you will cut us down!” His paddle gleamed behind him, and the canoe sprang ahead. Malcolm had not seen them. Before he could lift his hand, his boat shot along the stern of Strong’s, grazing it and sending a shiver over the lighter craft.

“Sit still, sit still,” said Strong in a low voice to the younger Miss Hardservice, as the canoe tipped and rocked. Her face was pale. He brought his boat around until he was close up to Malcolm. He looked at his friend, and then at Miss Hardservice. Malcolm was dazed, but she had a fine light on her beautiful face. Strong’s eyes flashed, and when he spoke his voice was trembling.

“You just missed drowning us all, Phil,” he said curtly, and turned his canoe toward the shore. His glance fell on his companion as his paddle flashed back and forth.

“I hope you were not frightened,” he said, trying to smile.

“Oh, no,” she answered; “you were so quick that I had no time to know that there was any danger.” But her lip quivered.

Strong did not seem to hear her. His lips were pressed together, and where his straight brows approached each other there was a little knot.

Malcolm apologized to him that evening.

“I nearly made a fatal blunder,” he said, “and I am ashamed enough of myself. You saved us all, Fred. Thank you very much,” and he tried to wring the other’s hand. “I was thrown out of my senses,” he went on, hesitating. “I—I was greatly surprised by something. Don’t be so stiff about it, Fred,” he added, with a rising color. “Miss Hardservice—that is, I made a terrible blunder.”

“All’s well that ends well,” answered the other, with a little laugh that was slightly harsh.

Not until the season was nearing its end did Colonel Hardservice lose faith in his strategy, and not even then would he believe that he had been entirely mistaken in his plan of conducting his campaign. But he was harassed by misgivings. Apparently he had won the day. Strong was nearly always with Bess, and Miss Hardservice was more kind to Malcolm than she had ever been before; but there was now an open restraint between every one. Strong and Malcolm had no more to do with each other than courtesy and civility demanded. The Colonel himself did not find the editor so entertaining or frank as he had been. Eleanor was the most natural of them all. She was as dignified as always, and if she were more bored

than usual, she did not allow herself to show it. Mrs. Hardservice thought Bess was growing pale, and hinted at malaria. The Colonel pooh-poohed at her alarm, but went off for a drive with his favorite child.

"Your old father is unhappy, Bess," he said, as they followed the winding road down by the sea. "What is the matter with us, anyway?" He cut his horses sharply.

She looked at him with startled eyes.

"I think we are all homesick, papa," she answered softly. She was looking away from his eyes. "It is too gay for us here," she continued, laughing. "Look at that." A merry party in a large buckboard passed them on the road, sending up a cloud of white dust. Bright ribbons fluttered and colored caps danced as the party greeted the popular Colonel and his daughter. "You are an old soldier, and I am nothing but a soldier's daughter, and I think we are—we are out of our element."

The Colonel scented danger afar, but he could not locate it. He looked down at his daughter. Her dark eyelashes were low, but he thought he saw something bright there. He put out his big hand over her little one, trying to stroke it in a clumsy way.

"Would you like to go home?" he asked.

She turned her soft eyes to his. They were wet.

"Yes—thank you, papa," she said. Her words were only breathed. She hid her face on his sleeve for a moment, and the grizzled warrior slashed his horses furiously as if with a saber.

THE HARDSERVICES were going to leave Bar Harbor. Every one was sorry. The last season's débutantes begged the Colonel to stay until they went. He smiled at them all, and, shaking his gray head, reminded them that he was a soldier. Strong did not come near them for two days. Malcolm was unchanged. They were to start on Saturday. On Friday, Strong, reaching the top of Newport after a rapid climb, found Malcolm sitting on a rock. He was smoking a cigar, and did not notice the approach of his friend until Strong stood before him. Then he flushed.

"Hallo, Phil," said Strong in a friendly voice which strained after a natural tone, "communing with nature?"

"No," said Malcolm; "I came up here because I was disgusted with myself. Left my buckboard on the road down there. Did you pass it?"

"I did n't notice it," answered Strong, scanning the other's face. "Look here, Phil," he went on, "I came up here to work off steam." He looked down the mountain's steep side. "You don't dare go down Newport with me?"

Malcolm pulled out his watch.

"We have n't time," he said. "It takes four hours when you have good luck. It will be dark before we strike the road."

"Will you go and risk it?" asked Strong.

"Yes," said the other, with a glance at the sinking sun.

They began the descent rapidly. They were both in the mood for hard work. As they slipped down shelving rocks or made downward leaps, catching at roots and bushes to stop their too hurried course, their spirits lightened. They warmed to each other as in their college vacation days, when they had tramped through the White Mountains. Strong caught his foot once, and went stumbling headlong for fully twenty feet. His neck was in danger, but when Malcolm came up to him, making long jumps, the editor was laughing and panting. His cheeks were tinged, and his eyes were filled with flashing light.

"This is fine!" he said, between his heavy breathing.

"You'll break your precious neck if you do that again," said Malcolm, and laughed.

The descent became more difficult. They reached the cliff part, and it took them over an hour to make thirty yards. They were lowering themselves by inches now on jutting rocks, exposed roots, and overhanging limbs of stunted trees. Strong was leading. He deftly slipped down to a shelf formed by the edge of a huge rock jutting out from the mountain-side. Malcolm was heavier, and could not get down. Strong jammed himself close to the rocky formation and leaned over, throwing his arms around the sharp protuberances of the rock.

"Put your foot on my back, and don't kick me over the side of the cliff, or we shall both be in the papers—in the obituary column," he said, laughing.

Malcolm let himself down upon Strong's back.

"Where is Atlas?" said Strong between his teeth, for Malcolm was heavy. "God, Phil!" he cried an instant later, throwing out one arm and catching Malcolm around the waist as he suddenly slipped off. "Steady, old man." Malcolm was suspended in air. Strong's muscles were like steel. He gripped the sharp rock with his left arm until the edges cut into his flesh. Bending his knees slowly, and with his teeth set, he strained down and back, dragging Malcolm up to the narrow shelf. He trembled when his arm released its hold. Malcolm was white. He looked down and shivered.

"It's getting late," said Strong, not waiting for the other to speak. "We can't go down that way," he went on hurriedly. "I have

been down Newport a dozen times, and I never before got into such a box."

He looked around him. A rough line, a sort of crease, like a wrinkle in a stone face, ran along the side of the rocks.

"Stay where you are, and I will see where this leads to," said Strong.

He worked his way carefully until he disappeared around a knob of granite. Then Malcolm saw him crawling back.

"Come on," said Strong when he reached the shelf. "I guess we can make it this way."

The two felt their way, holding to the wall at their side. Malcolm was in advance.

"Here it is," said Strong, after they had turned the corner. "Now," he said, "I don't want you to be foolish, Phil. Don't object to what I am going to say. This is probably the only place on this side of the mountain which is practically impassable. We have had the bad luck to get into it. Now we can't both get out of it." He flashed a look straight into the other's eyes. Malcolm's jaw was set.

"Don't look that way," Strong said. "I know you want to stay, but that is out of the question. You could not get me down, and I can drop you as lightly as a feather. And now I am going to show you how. You see it is n't fifteen feet to the next place of footing. All you have to do is to land there. Now, if I lie down here," and he started to take off his coat, "and hold on to that sapling"—he kicked it with his foot—"I can swing you out far enough to drop you there. Now for it."

"I won't go," said Malcolm, doggedly. "I'll stick it out with you."

"No, you will not," answered the other. "Don't you see that it is our only hope of getting out of this? I let you down. You get shaken up, but not hurt. There, not forty yards from us, is a little ravine. That means that it is easy going there until you reach the brush. Get into the bed of the ravine, crawl under the briars, and you strike the road. You will probably meet a buckboard in the road. You can be back in two hours—three, anyway. Mark the place where you come out, get a rope and lantern, and return for me. You can throw up the rope to me, and then I am out of it."

Strong got down on his knees to carry out his program. Malcolm put his hand on his friend's shoulder to stop him.

"Wait a minute," he said. "The Colonel is to go away to-morrow morning." Strong got off his knees, but he did not answer. Malcolm also paused.

"Well?" said Strong, finally.

"Well," answered Malcolm, echoing the word, "it 's just this, Fred. I did come up the mountain to-day to think, and I made my

decision before you met me. I made up my mind to ask her to-night, and if I go down I shall go straight to her and ask her. So I refuse to go, for I know that you—besides," he broke out, "you have just saved my life."

Strong leaned against the mountain-side. The sun had gone, and his shirt-sleeves shone white in the dusk. He started and picked up his coat. One arm was thrust into a sleeve, when he stopped and dropped the garment again. Getting down once more, he circled the young tree with his left arm.

"Come," he said; "I will let you down."

"Very well," said Malcolm, slowly. He sat on the edge of the rocky platform. He felt Strong's arm clench him just under his two arms. He could feel the nervous strength of it as it pinned him. Then Strong pushed him gently off. As Malcolm went over the side his eye caught sight of a crimson stain on the white of Strong's sleeve where the knife-like rock had gashed him when he saved Malcolm's life.

"What 's that?" cried Malcolm. "Blood?"

"Good-by, Phil, and good luck to you," said Strong, swinging the other out, and dropping him to the firm earth below.

"This is an outrage," cried Malcolm from below. "I shall stay here. You are cut, Fred."

"Run along and get that rope. It 's getting cold up here," answered Strong.

He could barely see Malcolm in the dusk as he reached the head of the ravine and turned to wave his hat. He heard an occasional crash as Malcolm beat his way through the brush; then there was silence, broken now and then by a rumble on the road far below him where some vehicle rolled along toward the town. He shivered with the chill of the approaching autumn, and buttoned his coat around his throat. He tried to follow in a mental calculation Malcolm's progress toward the town. He counted the steps he must have made, and as he thought of him getting nearer and nearer to the hotel where the Hardservices were staying, his breath came quicker. He paced up and down on the little ledge. The cold stars were mocking him. His restless eye caught the sapling near him. He seized it and tugged at it. His hand stretched up as high as it could reach, and, with the vein in the center of his forehead swelling, he bent the young tree down until he held it fast in both arms. It was over the drop. He reached out, and, shutting his eyes even in the darkness, swung clear on the swaying tree. It sank and sank until he released his hold. He heard its hissing as it cut the air, springing erect again, and he was on the ground, shocked and stunned. He sprang to his feet and ran, half feeling his way to the spot where he knew the ravine began. He leaped, he ran, he stumbled over its uneven bed. His head was whirl-

ing, and his feet were flying. He plunged along until he reached the mass of briars. They tore his hands where he thrust them out to open a passage. They tripped his feet and pulled him to the ground. But he fought through them, impatiently and fiercely. And then he reached the road. He turned into it on a run. He ran until his feet were weighted with lead, and his lungs were choked. Nobody could see him, and nobody could hear him, and he waved his arms and burdened his lips with oaths. His ear caught the muffled beats of hoofs pounding in the dust-covered road. There was the hum of wheels before him. He crushed himself against the bushes at the roadside to let them pass. They stopped, and a light flashed in his white face. Phil's kindly eyes were peering into his. The great Colonel, who had been crying, even as the wagon approached, "To the rescue!" was tugging at his torn hand.

"Fred, old man," cried Malcolm—"Fred, how did you do it?"

Strong smiled faintly. He turned to Malcolm and gripped his hand.

"They are n't going till next week," Phil whispered in his ear.

"Great God!" cried the Colonel, "the boy is hurt. He is bleeding all over. Then he opened his lungs.

"Back to the hotel!" he roared, and the wheels went spinning toward Bar Harbor.

THEY were all dancing. It was the last dance of the season. The perfume of crushed flowers was in the air, and there was a hum in the room which arose above the music. You could hear words of farewell, light laughter, and pretty compliments. Malcolm and the younger Miss Hardservice fell out from the moving throng, and went over to a corner where Mrs. Hardservice sat admiring her two daughters. The Colonel was not there. He was up in his room framing a letter which would assist him to discount his pay in advance. Strong and Miss Hardservice were promenading the room. Malcolm, Mrs. Hardservice, and her younger daughter kept their eyes on them. They were a handsome couple. In Miss Hardservice's cheek was a bright color. Her lips were parted in a half-formed smile, and her eyes sparkled under the light.

Strong's face had a light of reckless daring. Both tall and fair, many eyes followed them. Malcolm, watching them closely, showed in his face how he envied the fire and spirit of his friend. There was a look of hunger and discontent in his dark eyes. The younger Miss Hardservice saw it, while she watched her sister. When Malcolm turned to her with a guilty start, she was slightly pale, and her fan

was moving quickly. He dared not look into her soft eyes.

"Won't you go out for a promenade on the veranda?" he said.

The walking-space was crowded, and they found two chairs. He wanted to say something, but his lips were treacherous. They faltered and stumbled over the words. He was comparing himself with Strong. The editor was brave and reliant. Strong would ask Bess to marry him before she left Bar Harbor. He knew that, and he felt a pang when he remembered that this was the last night. If he could only make his lips say what he wanted them to confess. It startled him when he thought how every one fancied that he loved Eleanor. He looked at the little Miss Hardservice in a frightened way. She was very quiet. Suddenly he bent over. Three words, and he was trembling fearfully. Something in her eyes and in the way her hand fluttered sent a flash of courage through him. The words came forth of their own will.

When they went back to Mrs. Hardservice, Bess's olive cheek was tinted with a soft color. Strong was not about, and Eleanor had gone up-stairs to her father. Mother and daughter followed her. Bess, like a shy child, entered the room where her father and Eleanor sat. The pink in her cheek had not faded, and her eyes were soft and liquid. The old soldier's face was down between his hands. Eleanor sat erect, a little pale, and her eyes were feverishly brilliant.

Bess went up to her father and curled her arm about his neck, so that her hand rested on his cheek. The Colonel sighed. Eleanor had just told him that she was going to be married to Strong. His first thought had been of Bess, and the shock stunned him. Bess crossed the room to her mother, who was smiling softly, and, leading her up to the old man, knelt at his feet. He was kissing her as they told him the truth, and Eleanor was pressing his great hand to her lips. The old Colonel sobbed like a great boy, and then smiled through his tears.

Strong meanwhile was smoking a cigar before going to bed. Malcolm came up to him. He felt guilty. The editor greeted him warmly, over-heartily. He was elated, and his manner showed it; but he had the disposition of a conqueror. He felt that he could afford to be generously kind to his friend. They had both striven for the same prize, and he had won; all honor to a noble rival who had lost.

Malcolm was embarrassed. He could scarcely believe his good fortune. He had beaten a more able man, a man whom he loved, and for whom he felt sympathy; and yet he could not grieve for the other. It was fate that he should succeed over a better man. He

"AND THE TWO SMOKED IN SILENCE."

wanted to strengthen their friendship before the blow fell which should try it. He did not know how to begin.

Strong handed him a cigar, and tried to look serious. Malcolm's match sounded loud and out of harmony.

"Poor old Phil! how shall I tell him?" thought Strong. "It will be a great shock to him."

"I wish I had Fred's courage," Malcolm said to himself, "so that I could break it to him." And the two smoked in silence.

*Ervin Wardman.*

"LET THE DREAM GO."

I WAS so fain to love, dear!  
Let the dream go.  
The brightest vision dies of dawn,  
The rose, of snow;  
And blossoms all drift from the tree  
When June winds blow.

I was so fain to live, dear!  
Let the dream go.  
Who heeds the faded blooms of May  
That fall below?  
And though Spring's self should weep for them,  
They would not know.

*Anne Reeve Aldrich.*

A SOUTHWEST GALE.

## IN GLOUCESTER HARBOR.

WITH PICTURES FROM ETCHINGS BY THE AUTHOR.

THE arm of land called the Eastern Point, stretching out from the town of Gloucester and forming its harbor, possesses more attractions for one fond of the sea than does any other place on the coast that I know. Its shore toward the sea is protected by an armor of granite that breaks the force of storms, and within its shelter ride safely at anchor great barks from Italy and Spain, the fishing-fleet, and picturesque coasters, with their deck-loads of hay and timber. In the background rise the foreign-looking towers of the city, and at its extreme point is the old Eastern Lighthouse. Opposite, guarding the other side, is the rock of Norman's Woe, and stretching back toward the city are the dark Manchester Hills.

It was this intimacy with the sea that led me to make the Point my home. I moved into a farmhouse, a comfortable building of the American country type, surrounded by great birch-trees, a row of which stretched along the sea-wall across the lawn at its back, and beneath which I have the whole harbor spread out before me. In front of the house lies the lake, bordered by old willows and covered with lily-pads. Beyond the lake are Brace's Rock, the cliffs, and the sea.

Although life on the Point is lovely enough in summer,—I know of no place in the North where there are more song-birds,—its real interest and beauty begin in the autumn. In spite of its bleak exposure, it is warmer than Boston or Gloucester itself; the air is bracing, of course—and such color! The trees around the farm-house are of all colors, from the dark green of the willows in shadow to the silver

of the birches in sunlight; farther away, tall elms line the old fort-road. Grass meadows stretch up toward the hills, and gray rocks jut from the green. Over the meadow thence to the sea are blueberry-bushes and rich furze, changing with different seasons, making a brilliant carpet in pleasant weather, or softly toned into grays when clouds hide the sun. Then comes the delicate fringe of pale-green sea-grass, changing at another season into a golden yellow. All the gamut of color exists in rich profusion, from the deepest to the highest tones, tempered generally by the blues of the atmosphere. It is a place in which to live and study, like some of the old towns of France. My dog and cat take walks with me, and we enjoy them together; for Nature tempers us brutes into reasonable beings, and we find content in her society.

From the high land on the middle of the Point the shore stretches off to Thatcher's Island, with its two needle-like lighthouses, and down the coast on a fair day the eye can make out Plymouth: one of real New England faith and enthusiasm can almost see the Rock. You take in the whole sweep of ocean, horizon, and sky. The vessels lie anchored at your feet in still waters, and the town nestles comfortably in the distance. One afternoon I was watching the schooners sailing out on their mackerel-trips. All sail was set, even to the great staysails high up between the masts, the wind being fair from the northeast. Two or three coasters were at anchor, with mainsails up to keep their noses pointed toward the wind; the sun was shining, but far down toward Marblehead the sky was black. One or two schooners anchored near shore were taking in their canvas, a sure

sign that the barometer was falling. Another, pointing out under full sail, came about. The sky and water in the west had turned so dark a purple that the usually brown seaweed showed a golden yellow. A lull came in the wind, allowing a dull rumble of thunder to roll from Manchester; a vivid fork of lightning shot across the sky with a splitting shock, and a low-lying yellow cloud of dust rose from Magnolia. The wind was starting from the west with a rush; all the ships were brought up to meet it; and sails were coming down with a run, a brilliant, uncanny white against the intense black sky. The schooners were almost human in their panic as the fierce squall broke and the rain came down as though the heavens had been ripped open.

Such storms seldom touch the Point; tearing in from the sea, they pass over the harbor toward Annisquam, and in as short a time as it takes them to come up, they have swept out again. Then the sun shines out against the clouds piled up in the east; the vessels pluck up fresh courage, and are again on their courses, or have come quietly to anchor. The great arch of a rainbow stretches from north to south, and the day dies in a glowing mass of splendor. As the stars appear faintly through the deep blue, the riding lights dot the harbor,

bad weather, when I was rigged in oilskins and carried a lantern, it served only as an appetizer to a snug evening before the fire. One night in February I had gone as usual for the mail. The air was heavy with moisture; the night very dark and still. The glare from the town made the atmosphere brilliant in that direction, and the yellow lights of the vessels were reflected in the calm water almost to my feet. The only sound came from the booming fog-horn on Thatcher's Island. A gentle wind sprang up, ruffling the reflections, and brought across the water to the ear the sound of a band playing in Gloucester.

That was the only time I remember when loneliness became oppressive. The music was not of the classic order, nor of the quieter kind, dreamy and soft, but of the real city German-band sort. I smelt New York, heard the abominable street-cars, saw the carriages driving fast to a dinner or the opera with a bit of white something inside, and I felt homesick. The hoarse whistle of a steamer offshore interrupted the music and my memories. Then the fog-bell sounded at the Point, and a white cloud of steaming vapor poured in from the sea and rushed past me over the harbor, blotting out the lights, the water, and everything but loneliness. My wretched lantern kept company

A FAIR MORNING.

the green of a new arrival creeping slowly to her berth; then come the splash of an anchor, the rattle of a cable; and night is here.

Some evenings, when the wind has died away, leaving the air damp with heavy dew, the quiet of the harbor is often intensified by a chance noise. The cry of a man on shore hailing a schooner to send a boat for him will only make the quiet doubly still. One has an instinctive desire to go out and tell him to hush. The road along the beach was my regular evening walk, to get the letters and New York paper. Generally it was a pleasant one, and even in

with me on one side, and my ghostly shadow clung to me against the mist on the other. The trees dripped big drops that seemed to crawl in under my sou'wester and down my neck, and the salt air was fishy. That bad music had upset my contentment.

A winter's gale is always good and entertaining company, and a walk to the lighthouse sure to be exciting. The harbor is crowded with craft, coasters tugging at their anchors, burying their noses in the heavy southwest sea that rolls across the harbor. The more graceful fishermen courtesy to the black lighthouse-

THE SAILING OF THE SCHOONER.

tender and to the high, white steamers bound to Portland and Nova Scotia. Far out, many another craft under reefed foresail and jib is making for safety, sinking half-mast deep between the heavy seas. Seaward the cliffs are pouring cataracts of salt water inland, the very waves seeming glad to get ashore. A great angry, gray-green wall gathers together, and, as the back-wash runs out, piles up, and then hurls itself onward with dull thunder—to rise in a cutting mass of spray as it tears over the rocks. As darkness comes on, you climb over the slippery stone to a safe place, watching the ocean getting blacker and the rising columns of spray more ghostly; the shrieking wind and the noise of the waters sound like the cries of men cast away. I can almost see the wreckage

to which they must be clinging, and it becomes too real to enjoy. I turn to go home, almost pitching headlong in my haste. I know absolutely that it is all imagination, yet as a great souse of spray comes pounding upon my back I do not linger. That last dash seems almost an evidence of contempt on the part of the ocean, and as I scramble into the furze and bushes inland I have very little breath with which to give a sigh of relief. The farm-house looks wonderfully cheerful as I pass the stone woman of Eastern Point standing grim in the gathering darkness, and as I take a last look at the rising and falling lights of the harbor my dog welcomes me into cozy comfort. The wind has risen and brought driving sleet, that dread of sailors. The house trembles with the shock

of the blast as it beats against the window-pane, and my thoughts and sympathies turn toward the man at the wheel, the fishermen in their dories on the Banks, or the helpless schooner, broken from her moorings on the Georges, going to destruction, and carrying death in her path to another.

Sunshine gladdens the earth when I wake; the wind is fresh from the west, and a clear blue sky reflects itself in the water. Already those transient guests, the steamers, are crossing the Dog Bar, pitching in the brilliant seas, and rising with a white mantle of foam. The rattle of the pawls, the creaking of blocks, the clank, clank of the windlass, and the slowly rising white sails, tell that soon all will be tearing on their courses with a bone in their teeth. It is a very forlorn old hooker that cannot shine as a beauty on such a morning. High up in the heavens white clouds throw down again the brilliant sunshine. It is a day when darkest life seems good.

My dory is called the *Folly*, but her name must have been a jest. I never knew a steadier boat at her moorings, and in going about, unless you put the helm hard alee long before you intended to bring up into the wind, she'd bump into anything a quarter of a mile away. Had she only been worthy of her name, I could have blessed her with other than my ordinary thoughts on such an occasion. She has carried me out many a time at sunrise when the 'long-shore fishermen were at their nets and lobster-pots, set only a few rods from land. Their boats were of all colors, faded by the wind and sea into perfect harmony with the water and sky. Their sails were of all shades of brownish gray and blue-white, all massed together around a herring- or mackerel-net, where men in yellow oilskins were scooping in the fish, glistening as they shook off the last drop of their dear home with energetic flappings, and accommodated themselves to circumstances by losing their breath. Then as the *Folly* bore down upon them, just as likely stern first as not, threatening to break up their pleasant and fishy conversation into uncomplimentary fragments, I would bring up alongside of a kind, considerate friend whom I had paid high for fresh fish, and watch the scene. Many of the men in the dories were old commanders of schooners, their eyes bloodshot from long watching and driving salt spray. Too old to go on voyages, they cannot cast aside the habit of a life, but sail daily out to sea with a few clams or herring for bait, to haul in uncertain rock-cod, to jig for mackerel, or to have an old-time swear at cunners, dog-fish, and sculpins. I know one who is blind, but who hires a man to sail him out to sea in his dory every day, in order that he may not go to pieces on land. As they jibe the booms over and

sail away past the lighthouse, leaving me and the *Folly* to wonder how we are most easily to get back to breakfast, I hear the wheezing echo of a laugh as some one calls, "Push on the mast, mister, and let her bile." As I laboriously get the *Folly's* head around, and haul in the sheet to drift home any way she kindly will, the mackerel-schooners are coming out. Their sails are in deep blue shadow, tipped and edged with brilliant white where they belly around to the sunlight, their gently rising bows awaking the water into a bright ripple.

In summer the fishermen are off after mackerel, following the schools of fish up and down the coast. Very often they only chase delusive hopes. They catch the mackerel in long seines, and sometimes they take more than they can handle, the net breaks, and then instead of joy there is interlarded sorrow. When the catch has been good, the schooner floats in at sundown, generally with just wind enough to give the skipper at the wheel excuse for idleness, while the crew are busy splitting and cleaning the mackerel. As they come to anchor off the farm-house, flares are lighted, and the work goes on. Then the bay looks like an American Venetian fête, if there is such a thing, and daylight finds a tired crew sleeping the sleep of men who have earned their wages honestly.

The fisherman's life on the Banks and the Georges in winter is a very hard one, though they live well on board—better than on shore. They have to, that they may stand the excessive cold; and their pay is like their lives, a floating doubt. The voyage is made on shares. From the gross profits of the catch are deducted the cost of bait and ice, and one fourth of one per cent. for the Widows' and Orphans' Fund. One half of the net "stock," as it is called, goes to the owners of the vessel, the other half to the crew, from which is deducted each man's share of the crew's expenses; that is, cook's wages, water, medicine-chest, etc. They sail away full of hope and with a full larder. Arrived on the grounds, they anchor in about forty or fifty fathoms, and set their trawls. These are long lines, anchored on the bottom, and extending out from the schooner many hundreds of yards. To these, at intervals of a fathom (the distance varies for different fish), are attached shorter lines. These lines have to be attended in dories, each containing two men, who haul, bait, and land the fish in the boat, to be transferred to the schooner. Herein lie the danger and hardship, for the strong tides of the Banks and the shoal water pile up great combing seas. The cold is cruel, and the work hard. Suddenly down comes a fog, not the soft mist of summer or autumn, but a thick, heavy bank, soaked through with the penetrating cold of

the icebergs further north. Horns are blown from the vessel, but every year many dories are lost. One would think that common sense, if not law, would make each dory carry a breaker of water and pilot-bread; but none do, and either experience does not teach or the fishermen like such chances, for year after year comes the same old story of a lost dory and two men

with the skipper and his crew, and the dread that must be theirs of telling who it is that is missing. Once I used to see an old man and a young woman on the rocks where I was painting. They came regularly every morning and afternoon, and carried an ancient telescope with which they searched the horizon. But the sea kept its secret from them, and the overdue

THE RETURN OF THE SCHOONER.

starved or dead of thirst. When the fog lifts they are many miles from their schooner, and are carried by the swift tides they know not whither. Then come days of hunger and thirst; hands are frozen to the oars; madness haunts them; and then—death. Sometimes they make land or are picked up by a passing vessel, in which case they often return before their own schooner; but that great happiness is rare. Then their vessel, which so gaily sailed out past the light, comes home with her flag at half-mast.

I HAVE sat under the trees on a morning when returning spring softens and lights up everything, and the birds have come, and the leaves are just breaking from their winter sheathing. Slowly a schooner rounds the Point, with her flag at half-mast. It is impossible to be careless in thought for that day; no matter what joy may be in your heart, you feel

schooner never came. She had been out for four months, a long time for a voyage, but they could not give up that hope which was then their sole interest in life.

But a schooner's home-coming is generally of a brighter cast, and you find yourself quite as much in sympathy with the fishermen's joys as with their sorrows. Usually they sweep in from the northeast over a blue sea, and, passing the red buoy on the Dog Bar, turn the tiller for a straight and fair course up the harbor past Ten Pond Island. But they may come with a heavy fog. Then there is a screeching tug that seems to go out to patrol the coast, warning vessels off the rocks. She really hopes to find one so near danger that her assistance will be grateful to a wearied crew; or if the wind is light, as it generally is in a fog, she counts on the crew's impatience to get ashore. The fee is made up by the tired-out fishermen, and they pass up the harbor in luxurious ease.

## SONGS.

### "BECAUSE THE ROSE MUST FADE."

I.

BECAUSE the rose must fade,  
Shall I not love the rose?  
Because the summer shade  
Passes when winter blows,  
Shall I not rest me there  
In the cool air?

II.

Because the sunset sky  
Makes music in my soul,  
Only to fail and die,  
Shall I not take the whole  
Of beauty that it gives  
While yet it lives?

III.

Because the sweet of youth  
Doth vanish all too soon,  
Shall I forget, forsooth,  
'To learn its lingering tune—  
My joy to memorize  
In those young eyes?

IV.

If, like the summer flower  
That blooms,—a fragrant death,—  
Keen music hath no power  
'To live beyond its breath,  
Then of this flood of song  
Let me drink long!

V.

Ah, yes, because the rose  
Fades, and the sunset skies  
Darken, and winter blows  
All bare, and music dies—  
Therefore, now is to me  
Eternity!

### "FADES THE ROSE."

I.

FADES the rose; the year grows  
old;  
The tale is told;  
Youth doth depart,—  
Only stays the heart.

II.

Ah, no! if stays the heart,  
Youth can ne'er depart,  
Nor the sweet tale be told,—  
Never the rose fade, nor the year  
grow old.

*R. W. Gilder.*

"I WAS NOT LOOKING AT YOU—I WAS LOOKING AT ALAN."

## THE CHOSEN VALLEY.<sup>1</sup>—IV.

BY MARY HALLOCK FOOTE,

Author of "The Led-Horse Claim," "John Bodewin's Testimony," etc.

WITH PICTURE BY THE AUTHOR.

XII.

HE physical shock Alan had suffered worked no sudden regeneration of his character, but the joy of his restoration floated the business of the compromise off the reef on which it had struck.

Norrisson was now the generous host, the fatherly sympathizer, and Dunsmuir's great boom of happiness swept all contention and bitterness out of his soul. For the time he had ceased to think of his wrongs; he was ashamed to haggle about the terms of a surrender which had lost for him its vital significance. What mattered who built the ditch, or how? He blessed God that he had his son.

The question of managerial dictation to the chief engineer was not again raised; it was noticeable that all parties avoided it, and Westershall sailed for the other side with the tacit understanding that all radical points of dispute were settled.

Alan had meant to take no advantage of his temporary importance. The household was prostrate before him; none of the old issues were revived between him and his father, except as he himself chose to revive them, in honest contrition. He had planned a different and much humbler home-coming. He had arranged the meeting in his own mind, very modestly, if also effectively; his father was to have seen him, first, with a pick in his hand, at work with the men. Perhaps he had counted on the robe and the ring and the feasting afterward. However, it had all been taken out of his hands, and his father had only his bare word for the intentions he was not strong enough as yet to put in practice; but Dunsmuir asked nothing, not even his boy's word. It was a specious content which could not last.

Summer was advancing, ever deeper in dust. The sky was tarnished with haze. The sunsets were longer burning out in the west, in colors more tragic. The river had sunk in its bed, and the eery laugh was no more heard. There was another sound as night fell, which made music in Dunsmuir's ears—the roll of the contractor's wagon-trains moving into the cañon, as the force on the work increased. By day clouds of dust, from the slow procession of

scraper-teams, hung like the smoke of an artillery engagement along the crests of the mesa. Where Dunsmuir had been wont to watch for the light of one lone cabin twinkling close to the shore, a galaxy blazed by night along both sides of the gulch above Job's cabin; and on the beach below were tents and camp-fires, and men and cattle, and all the dirt and paraphernalia of a huge contractor's outfit.

The cabin was no longer a possible place for Margaret. She lived, now, at the house, and Job camped with the force and visited her on Sundays, as he used before they were married. But they were not at home, as they had been in their bit of a room below, where Margaret was mistress and Job was man of the house. Dolly tried to lure them out of the hot kitchen into the parlor off the dining-room, where she and Margaret held their domestic consultations; but it was not the same to Margaret—going deliberately to sit there with Job in his best clothes, with nothing to do, and members of the family passing in and out with smiles of "How do you do, Job?" and affable questions about the work.

Nothing in life persists like the essential nature of our individual needs and peculiarities; the smallest of them are often the most insistent. The household, having been drugged with extreme joy, came to itself after a while, and discovered that nothing, not even Alan, had changed: only the work had "started up" and jostled them all out of their old places; and if it had brought them the long-looked-for rest and triumph and security, none of the elders had yet found it out. Job missed his old importance to the work; he missed Margaret, and thought that she worked too hard; and he sorely missed his home. He was not a skilled laborer. His record counted for little in the new organization, unless Dunsmuir found time to remember it. He had not been able to procure for Job any position better than that of a "pick-handle boss" under one of the sub-contractors. Job knew that his place could be filled at a day's notice. Dunsmuir was feeling keenly his private indebtedness to these tried friends, now that he had come, apparently, into his kingdom. He had intimated to Job that the closing deal had been hard upon him, financially. Job knew the water-right had not been sustained, and was not surprised; but he asked no

<sup>1</sup> Copyright, 1892, by Mary Hallock Foote.

questions, and Dunsmuir could not bring himself to own that he had nothing to show for his share in his own scheme, after the years he had stood under it, but his salary and a trifle of stock not presently available. Debtors, who had respected his difficulties and accepted his promises, were "jumping" on him now that he was supposed to have made a prosperous alliance. Job and Margaret were treated with the distinction conferred upon relatives, and creditors in love: they were presumed to be willing to wait, and they waited; but the situation began to be felt, even on their side, now. If Dunsmuir could have talked with them openly, he might have drawn anew upon their lasting truth and warmth of feeling; but between his pride and soreness, and their pride and shyness, and their habit of waiting for the first word to come from him, the rift widened. Dunsmuir thought that, peasant-fashion, they distrusted him, and were feeling their pocket-injury; Job and Margaret thought of him weakly uplifted, and oblivious of the past. They pitied him, as hand-workers pity the man who works with his head whose results do not check with the plain demands of life.

Meanwhile Alan, beset by the new distractions about him, fell into the old restive languor over his books. The rumor and stir of the camps fired his blood; the town was nearer than ever, with horsemen posting back and forth, and livery-teams, and telegrams. He had promised himself that he would never "kick" again; but within six weeks after his pathetic home-coming he was imploring his father to give him a chance elsewhere. He brought forward an offer made him by Mr. Norrisson of a junior clerk's place in the company's office in town, on a salary which seemed riches to the boy's habitual impecuniosity. The offer had included a home for Alan in his patron's house. Norrisson had taken a fancy to the lad, had petted him enormously as his guest, prophesying him the future of a man of affairs. Dunsmuir could see how the magnificence of Norrisson's business ideas, his splendid, easy way of living, had affected Alan's imagination, as the luxury of his house affected his body just rescued from the pit. Few things could have been harder for Dunsmuir than to see his son drift from his own control under an influence which he profoundly distrusted: but the fact had to be faced; no more issues could be taken now. Alan must go the way of his temperament, even as Philip, from the alien house, had been drawn the way of his.

One afternoon, quite at the beginning of the cañon work, Philip had climbed the slope beneath the bluffs to paint a target for a reference point on a rock conspicuous from the opposite side. The buck-sage was out of bloom, and,

though seated close to the cave, he had not thought of its neighborhood until he heard footsteps, and saw Dolly loitering toward him. She had gone to seek a missing book in that unfrequented repository, and, seeing Philip at his tantalizing employment, curiosity dragged her to the spot. He took no notice till she was standing close behind him.

"That 's a very queer target," said she. "What do you practise with?"

"A Buff & Berger."

"What is a Buff & Berger?"

"It is a kind of transit they make in Boston."

"Oh. And are you really painting that thing because you must?"

Philip had drawn a circle on the rock, and quartered it, and was now painting the opposite quadrants white and red.

"I, or some other man," he said. "Did you think I was painting it for its beauty or its deep significance?"

"Why, it might signify things," said Dolly, seating herself for conversation.

"What things, for example?"

"Of course I can't think of anything when you ask me. It might be a chief's signal, a kind of cross-tarrie, if there were anybody to rise or anything to rise for."

"There speaks the daughter of the Duin-héwassel."

"No," said Dolly, rather regretfully; "we are not a clan family, on my father's side. His forebears were Saxon and Whiggish, and non-conforming, and non-everything. They were 'kickers,' as Alan says. Of course, you know, I am no Jacobite at this late day; yet I think there was just as good praying on their side."

"And some very 'pretty men,'" said Philip, smiling. "Still, you must allow for the glamour of a lost cause. The histories for children seek rather to be picturesque, I think, than sternly just."

"They had the best songs," said Dolly, "and when we are 'children'" — she returned his playful emphasis — "we fight as we sing."

"And when we are men, we fight as our girls sing. I hear you wasting a lot of pathos, even now, on that waefu' name of Charlie."

He looked at her, as he took a fresh brushful of paint, and forced her to return his smile, which she did with the pleasing addition of a fine large blush. He could at any time make her blush, but he did not value the symptom, knowing how little a change of color or the absence of it signifies with these innocent young faces.

The blush made her suddenly serious. "I am thankful there are no such wasteful quarrels now," she said. "But the uneasy spirit never dies: when the fighting stops the schemes begin."

"Are you not friendly to the scheme?"

"To my father's?"

"To ours. They are the same?"

"Nothing else, then, is the same. And nothing is as we used to think it would be when we dreamed of the work starting up."

"How do you mean?"

"Well, the cañon. It's quite another place to what it was. Things I used to feel and think seem nonsense to me now. I am much older."

"Three weeks?"

"Three years."

"How many places have you ever seen outside the cañon?"

"None that I remember, unless you call the town a place."

"Why do you speak so scornfully? It is a very nice little town."

"You ought to think so, truly. It's a sort of relative of yours; you have the same name, and the same parent, is n't that what they say?"

"Never mind what they say. Tell me some other things you have n't seen."

"But I've never seen anything. If it's a list of my ignorances you want I might sit here all the afternoon."

"Begin, then, by all means. Have you ever seen—the flag of your country, officially displayed?"

"Which is my country, I wonder? Alan says he would fight for the Stars and Stripes; but I should go with my father."

"Better postpone the decision till after your marriage."

"I shall never marry on that side, flag or no flag."

"*Bien*, but why?" asked Philip, opening his eyes.

"Well, I should not care to marry beneath a certain class, the class I'm supposed to belong to," she argued seriously; "yet I have not been bred like the women of that class. I should never feel at home with them."

"But what can you know of them?"

"Oh, I have studied them for years; in the novels, you know, and in French—the tall girls with their high shoulders and their short upper lips, and the young men with their insolent Greek profiles."

"But you were speaking of the women."

"The women, of course; the duchess, and the husband-hunting mamas, and the little nobodies who are trying to get on, and the rude somebodies who crush them whenever they get the chance, and the flirting old maids, and the masher, and the dean—"

"And have you taken them seriously?"

"Why should n't I? They must be true, else how do you explain their tremendous vogue? Should you think a provincial stranger would be happy among them? Fancy their charity,

their 'amenities'; how they would feel another's woe and hide the fault they see! My accent would be wrong, I should n't know their talk, and they would never care to know mine; and if I tried to be like them I should be affected."

Philip dissembled his intense amusement, and answered, "You are thinking of types."

"Well, I should be a type. When one is in the right place one is taken as a matter of course. It is n't thought necessary to whisper, 'She grew up in a cañon!' No; I'd rather dream of the Old Country and call it home, than go there to find myself without a country."

"When you speak of the Old Country do you mean England or Scotland?"

"Both; but I was born in India, in the Punjab, in the great days of my father's work. I wish he had stayed where they know what an engineer is. Here his record counts for nothing; he might as well be a tinker. Anybody who can run a hand-level is an engineer in America."

"Thanks," said Philip. "I am an American engineer."

Dolly nodded at him very sweetly. "I have no prejudices," she assured him; and when Philip laughed aloud, she was quite mystified. "I used to dream of nothing," she went on, "but how my father was ever to get this work done. I used to long for the power to help him. You know a girl's only way to get power is to marry it," she confided to him, as a great discovery. "I mean a girl like me, with no education, or genius of her own. Yes; it was actually one of my make-believes—I must have been in pinafores. There should come a rich traveler to visit the cañon who would be astonished at my father's daughter. I should have been, not as I am, you know, but a dark-eyed, red and white wonderful beauty. But I would not listen to him till he had promised to back my father's scheme."

"He was to purchase your hand, then, by building the ditch?"

"Of course; what else?"

"Was there a heart anywhere in the business?"

"There was his heart. Do you think I would marry a man that did not care for me?"

"And where was your heart, meanwhile?"

"With my blessed, dear daddy," exclaimed Dolly, with perfect self-satisfaction.

"And these are the dreams of girlhood in a cañon! You must have read some very silly books."

"Isn't it a woman's duty to help her family?"

"It is her first duty to be honest, if she can."

"If we had always been free we might have been honest."

"Is that a tale ye borrow'?" Philip re-

torted, " 'or is 't some words ye 've learned by rote?'"

Dolly was caught by the quotation, which she was pleased to call felicitous, and omitted to observe that Philip's reply was merely an evasion.

He continued to question her, enjoying the frank side-lights of biography her answers shed upon the family past.

"And was Alan born under the Stars and Stripes that he should declare for America?"

"No; not he. We are twins, did you not know? After India we lived in a stupid house in Bedford Park while papa was looking up his scheme in this country. Sometimes we went to the sea, and sometimes to Dalgarnie, my grandmother's house in the north. Margaret tells us about those places till I think I can remember; but of course I cannot. I was but three when we came to the cañon; and there is something deadening in the sight of these bluffs that never change, and these lights and winds and sounds that go on from year to year. I wonder we are not all a little touched. I think we are a wee bit off, each one of us, in a way of our own."

She crowded herself closer into a hollow of the slope, clasping her knees, and talking in a sing-song, drowsy monologue to the tune of the river and the breeze stirring the dry hill-grasses above their heads. Philip stole a look at her from time to time, and wantonly nursed his job.

"Yes; I surely think we have been at times a little warped," she mused aloud, encouraged by his silence. "There used to be a sound—I think you have never heard it—a sound inside of all other sounds, like a ringing in the ears; I cannot describe it. We used to hear it when the river talked at night. Well, you cannot think how I used to dread that sound; it was like a wicked laugh. Margaret said it was 'unchancy.' And now it seems such perfect nonsense. I wonder I'm not ashamed to tell you. But the spell is broken now."

"I would have had it last long enough to include me," said Philip. "And so the cañon is quite spoiled, you think?" he questioned, half jealously.

"I did not say spoiled; not the same."

"Still, you would not have liked to stay here as it was?"

"I should have had to, I fancy, whether I liked it or not. I could have kept my make-believes. Now I don't care for them any more."

"Ah," murmured Philip. "And the rich traveler—what would you say to him now?"

"I don't need him now: the work 's going on without him."

"But if the work should stop; how then? Would you be ready to make that same bargain?"

"I told you I was a child."

"Tell me some other things you used to think when you were a child. A girl's flights are so different from a boy's."

"You would laugh."

"Never! Am I such a Philistine? Do you think I have no bees in my own bonnet?"

"Have you ever heard the cañon-bird?" asked Dolly, shyly.

"Once—twice; never since the work began."

"You have noticed that, too? I think it does not like the work; and I am so sorry."

"Is the bird supposed to be an omniscience that has to be propitiated?"

"I knew you would laugh!"

"But it is you who are laughing."

"Do you know—there is no such bird."

"You mean it is not set down in the bird-books?"

"Not that we can find. And not one of us has ever traced the song. It is a shy singer; its voice, if you 've noticed, comes from far away, for all it 's so piercing. We hear it only in shady, quiet places like the poplars or the big cut, or up in the shadow of the bluffs; and no one has ever heard it beyond the cañon. It was after we had the sorrow here: my mother was taken, and then it began to be heard, and only in those places that she loved. This I have never said to any one. When I was a little girl I used to think it meant that I was doing right or was going to be happy, whenever I heard the bird. It was my four-leaved clover, my new moon over the right shoulder. Did I not tell you we are a little touched?"

After a silence, Philip said: "Do you remember the first time that you deigned to look at me? You stood below the bluffs, and we heard the bird."

"Oh, if you mean that time! I was n't looking at you at all. I was looking at Alan," said Dolly, disingenuously; and as she spoke came the rare, piercing, faltering note, dropping through the silence. She could not help but look at him now; and Philip blessed the bird.

## XIII.

"I HAVE something for you," said Philip one day on his return from town, handing a neat parcel to Dolly.

"A jeweler's box for me? Who can it be from?"

"The rich traveler, I think, must be not far off. Seebright said it was for 'some of the cañon folks,' and as it seems to be a woman's toy I conclude it must be for you."

Dolly was in a twitter of curiosity as she opened the velvet box, and turned its contents out upon her palm. The bauble's weight was

more than she was prepared for; it fell, and rolled the length of the room.

"What an odd thing! Whatever can it be meant for?"

"To hang about your neck, apparently," said Philip, examining it as he picked it up. It was in size, shape, and weight the pattern of a rifle-ball, polished, and gilded, and pierced to receive the loop of a slender gold chain; and round the middle went a gold band engraved with a legend in Spanish, which Philip translated at Dolly's command.

"He's a Don, you see, not an English somebody; and he says that 'Love flourishes from a wound.'"

"What rubbish!" cried Dolly, blushing. "Have n't you heard something like that before?"

"Remarks of that kind are not expected to be original; and he may have been hampered in his observations by the very trifling circumstance of a bullet. Do bullets stand for arrows in the language of the western *amoroso*?"

"How do you know he is western? He knows Spanish, it seems."

"He adapts it viley from the Latin. '*Virescit vulnere virtus*' is the fountain of his wit. Dolly, it's come to a pretty pass; people turning virtue into love on your account!"

"You know that it can have nothing to do with me." Dolly began to look teased.

"What does Seebright say?"

"He says that one of his assistants took the order, and the young man's amusements overcame him somewhat, and he mixed his labels up, and has since been fired. All the direction on the box was 'The cañon.'"

"It might be some joke of Alan's—the expensive chiel!" mused Dolly. "But I never knew Alan meddle with sentiment, and he could never have got his verb right."

"Alan's Spanish is improving," said Philip.

"Did you know he was taking lessons?"

"No, I did not. And who is his teacher?"

"My father's cook."

"His Spanish, then, will match his English," sighed Dolly.

"Not at all. Enrique prides himself. He can turn a phrase as neatly as an omelet; he is a professional writer of love-letters, moreover, and by his own account he has plenty of practice."

"Dear me, are there so many of them—those Mexicans?"

"They may be stronger in feeling than in numbers."

"I hope Alan does not go among them," said Dolly, looking troubled. "I hear that the Vargas family have moved to town; and if Alan should be careless, and forget his promise—"

"What promise?"

"Why, you know, about Antonia Vargas helping him out of the cave. Her family would take it very ill if Alan should make it common talk."

"He might placard the town with it," laughed Philip; "not one in a hundred would ever believe the story. I should n't myself, only for the letter in evidence."

"What would you have believed, pray?" asked Dolly, offended by his joking.

"I should have thought the lad must have been a trifle rattled about the time he saw an angel in petticoats descending, hand over hand, thirty feet on a three-quarter-inch rope. Try it yourself, some time."

"I don't see what difference it makes what anybody believes. Antonia knows what she did, and whether she wants it talked of. Alan is so careless, and I feel that, somehow, Pacheco shadows him, still."

"Pacheco has made it impossible for himself to come back. He has stolen a horse, which is worse for him, I understand, than to have killed his man."

"Pacheco is betrothed to Antonia Vargas. He will come back for her."

"Are you sure of that?"

"So they say; and she defended him with a pistol."

"A countryman is a countryman; and it may have been her Mexican idea of hospitality."

"Alan ought to be very careful," Dolly repeated.

"By the way, was the bullet taken from Alan's arm, do you know; or did it pass clean through?"

"Alan has the bullet; he is prouder of it than—" Their eyes met. "You do not think?" Dolly questioned, flushing hotly.

"It was just a fancy," said Philip; "and I am not very proud of it. Still, as a joke, you know."

"Alan is not that sort of boy at all," pronounced Dolly. "You make me wretched."

"Come, now, I did n't say that he was. But I did hear Alan say, once, that if ever he met Pacheco's girl he would give her back her bullet."

"Don't you think you had better make some inquiries?"

"Of Alan? Hardly."

"Of Seebright, perhaps."

"I think," said Philip, "that I shall spend more of my evenings in town."

"Oh, thank you!" Dolly raised her eyes full of warmest gratitude to his.

"Do you think me an offensive prig? I feel quite an old fellow of my years with Alan."

"Oh, Alan is a perfect child; and sometimes a perfect hoodlum. But don't you think he is a dear?"

"I think he is very nearly related to a dearer than dear."

"Please don't try to be funny; I want to think," said Dolly.

"Wait, and do your thinking to-night; or leave it to me. There is one little fault I have to find with the cañon family —"

"I should think you might have found several." Dolly tried to look indifferent.

"Not a fault, perhaps, but a tendency. You take things—most things—too seriously."

"Oh!"

"And some things not seriously enough."

"As, for instance?"

"The fact that I am exiling myself of evenings, when the cañon is most the cañon to me, all for your brother's sake, who will not thank me,—far from it,—and you see nothing in it at all!"

"I would do as much for you."

"Thanks. For my brother, supposing I had one?"

"For either. If you needed such companionship or influence as mine, I should think nothing of giving it, at any cost. I should feel so flattered to have been of use."

"Why do you assume that I don't need it? As a fact, I am distinctly preferring another's needs to my own."

"Because" — Dolly hesitated, blushed, and broke into a smile — "because you seem to think you want it. Now the thing we want is very seldom the thing we need."

"Who told you that, pray? You got it out of books, where you get all your strained, conventional notions of self-sacrifice. Not that I blame you; all self-centered people grow morbid in solitude, and your still waters have bred lilies, while some would have bred ugly weeds."

Dolly put aside the words with a gesture of disgust. "I hate to be analyzed!" she exclaimed. "What can it matter? Weeds or lilies, we are always a collection of curiosities you have unearthed, and are studying at your leisure. I am very tired of it."

"And I am tired of being totally and always misunderstood, and treated as a stranger. Now, to-night, if I should be late to dinner, why should you not sit with me, as you would with Alan or your father? What is my position in the household?"

"Margaret says you are 'just an apprentice, nae mair,'" said Dolly, wickedly.

"Very well; then why not give me my meals with the men?"

"I will sit with you," Dolly relented, "if you are n't too late. I will bring a book — as I do with Alan."

"If you do, I shall take the book away."

"Indeed, will you?"

"Just try me. If you come to keep me com-

pany with a book, miss, that book is forfeit, and the penalty I shall name, and take."

"I wish you would take this." Dolly held out the box at arm's length; Philip took it and her hand with it.

"What manners!" she exclaimed. "I think Margaret was right — 'an apprentice, nae mair!'" and she fled before Philip could make reprisals.

During their first weeks together in the cañon the young people had behaved maturely, talking in well-constructed sentences about books and manners and the conduct of life; and Philip told Dolly about his school-days and vacations abroad, and compared the apparent fullness of his experience with the narrowness of hers, of which she was much ashamed; and contrasted the slightness and poverty of his intimacies with her constant, warm, concentrated life of home, which she took as a matter of course, and he considered a marvel of preciousness and unusualness. But youth and gaiety, and the high-tide of summer weather, and the propinquity of morning, noon, and night in the same small house, soon brought them to a pass which included romps and quarrels, and flights of ecstasy unaccounted for; and Philip, who always spoke of Miss Dunsmuir to the young lady's father, called her Dolly to herself, and felt toward her as to a darling, irresistible child, and sometimes as to a young goddess, far beyond his reach.

He had missed, through his mother's theories of education, all those girl-friendships which had been his birthright, which he had not lost his taste for, nor forfeited his right to enjoy. Beautiful girls and women he had met in all the ways conventionally prescribed, some of them sufficiently intimate; but never had he assisted a pretty girl in a white apron, with her hair pushed into a cap, perched on the library-steps, to dust and arrange her father's bookshelves; or watched her whip meringues or ice a cake; or train her wind-blown roses; or ransack trunks in an attic under the brown eaves; or mount a restless pony — for Dolly's drilling in this feat had fallen to him instead of to Alan, as legitimately planned. He had seen her in all her very few and simple home frocks, but never in a dinner- or dancing-dress. He had done everything with her but the conventional thing — from fighting her futile theories of life, to laying a fire on the hearth, or sitting by and measuring the spaces while she changed the buttons on his riding-coats; which, with his life of constant exercise in the light air of the plains, were getting all too tight in the chest and too loose in the waist. He had taken into his own hands those little services which a brother can perform for a sister, or pungently neglect; and Philip neglected nothing. Such privileges had

been too rare in his life to be undervalued; and of course the particular girl made a difference. Dolly was unique: a surprise every day, in that she could be both so childish beyond belief, and so deliciously womanly as almost to bring the tears to his eyes. Most of all he prized his evenings—for then she was all woman—on the wan sands where the river's "curmuring" forced them to be silent, or up among the pierced shadows of the poplars, or up again in the solemn, clear light that brooded on the bluffs.

In keeping a brotherly watch over Alan's evenings Philip had lost many an evening of his own; but now and then the sacrifice was richly rewarded. He and Alan began those rides together which the boy had once coveted; miles of twilight country they covered, silent for the most part, Philip, in spirit, with Dolly by his side. He had never yet had the chance to ride with her, and so he was always scheming and dreaming about it. One evening she drove down with her father, and the cañon family dined all together in town. Mr. Norrisson was absent, and Philip did the honors with fastidious recklessness. He had spent the better part of the day elaborating his preparations; he had arranged the flowers in his mother's dressing-room,—hers in name, though she had never entered it,—heaping roses upon roses wherever roses would go, and choosing with difficult fancy the most beautiful ones for Dolly's bouquet. He knew how she would come, in her little home-made habit, and he exulted in thinking of her dear simplicity in contrast to the stupid braveries of that money-built house. He was at pains to make the contrast as great as possible, that he might gloat upon her difference, which she neither understood nor knew to value.

She had been a full hour in the house, and Philip was wondering what should keep her so unconscionably long up-stairs. Now Dolly had never been in such a splendid room in her life before, so intricately arranged for the gratification of the exterior life of woman, the adornment of her person, and her study of that person when adorned. Never had she seen herself so plenteously, repeatedly reflected in mirrors, long, and wide, and multiple. She was standing in front of one of these, stepping back and forth, smiling in a curious, surprised intimacy with her own full-length figure, when Philip knocked at the door, begging her to make a little haste.

"Has papa come?"

"Not yet; but may n't I speak to you? I want to ask you—" Dolly opened the door: her cheeks were scarlet, her eyes brilliant yet shy—"I want to ask what you think of this room. It was done by a famous decorator who has never seen his work; nor has my mother, for whom it was intended."

"What would my opinion be worth? I have never seen anything but our poor rooms. I am thinking how strange that we should be here! You will never know how strange, that I should be here."

"In the palace of the Beast?" Their eyes, meeting, took away the scoff from the words. "I know more than you think; more perhaps than you know yourself."

"Well, it does n't matter," said Dolly, absently. "We are the changelings of the scheme. What you have I might have had, perhaps; but I never cared—until now. Now I care, sometimes."

"For what do you care?"

Dolly frowned in her way when she was disposed to be very practical.

"Do you know, I think to-day will be a good time for you to put me through my dinner paces."

"What in the world do you mean?"

"I don't think you realize quite how provincial I am—what a perfect desert-islander. I have never dined in a fine house in my life, and dinner fashions are always changing; our cañon ways must be far behind. To-day we shall be by ourselves, and I shall not mind your correcting me if I make mistakes. But, perhaps," she hesitated, "of course it will not be a swell dinner for only us."

"Such as you will find it, the house can do no more," Philip assured her, gravely. "The table is in full regalia; Enrique has been commanded to sacrifice to his gods; Wong has every stitch of canvas set; he rustles like a Channel breeze; myself you see in riding-dress, but only to match yourself."

"How nice of you!" cried Dolly. "Then we can have a regular rehearsal—wanting the clothes; but the clothes will not matter. Mind, now, that you watch me!"

"Dolly, you are growing terribly ambitious. You are thinking of that Englishman, confound him! You are preparing to meet the duchess and the masquerade."

"No," said Dolly, sincerely, with a shade of trouble in her voice; "I am only comparing myself, that ought to be a lady, with ladies who belong in a room like this. If you will believe me, I don't even know what half of these things are for!"

"If by those 'ladies' you mean my mother," said Philip, forced to be serious though he wanted to catch her in his arms and call her a precious little goose, "I can tell you that when she was your age she had no such room as this, which, by the way, she disdains; she was breaking colts, like a young Diana, on the range; and if she had a four-bit hand-glass to do her back hair in, it was as much as she had. And she

was happy then — and, I am told, made others happy."

"But of course she must have wanted all these things, by instinct, before she ever knew what they were."

"Are you afraid you have n't the instincts of a lady? Pity you are such a little savage! My mother wanted, always has wanted, the thing beyond. So do I. Would you like a room like this, Dolly?"

"I certainly should like a few of those acres of wardrobes. I spend my life trying to find places to put things. And I confess there is a fascination in a long mirror."

"I should think there might be—for some persons."

"It is n't altogether vanity. You can't think how awkward it is never to have seen how one's skirts hang. Not that there would be much pleasure in it, for mine hang very badly."

"When you are not in them."

"Why do you say those things? It is n't like you, and I don't enjoy it."

"You must get used to it if you are going to be a society girl."

"There you are unjust. Why should I not wish to know all the ways? You may think I shall never have need of any but my own; but I was not born in a cañon."

"Dolly, my—well, it is useless. Words are useless. You could never understand—I mean, there is but one way to make you. Will you take my arm?"

"Why should I?"

"Because it is supposed to be the thing to do."

"Oh," said Dolly, meekly, and took it. She was visibly wrought upon by her surroundings in a way that might have amused Philip more, but that the world of things had had such serious meanings for his mother, who was a priestess of bric-à-brac, and studied her surroundings as if the art of life, like that of the stage, largely consisted in how one is costumed and in what chair one shall sit—and he grudged this cult its possible importance in the girl's fresh fate.

"There is another thing," she agitated dreamily, as they passed down the wide, thick-carpeted stairs. They had halted on the landing to get the effect of the hall below, and the light of a colored window threw flaming gules and amber and tints of serpent-green on her pale golden hair and dark-clad shoulders.

"What is this other thing? Something wicked and worldly, of course."

"No; only just human. Dancing is the right of every girl that lives and moves, and I can never dance because there is no way to learn. And what shall I do if ever I go where dancing is? My heart would break with the music! Surely it's as bad to be foot-tied as tongue-tied;

and they talk of nightingales heart-stifled in their dells!"

"This is very serious," said Philip. "I perfectly agree with you; dancing is more a girl's right than silver-backed brushes and acres of wardrobe. But what's to be done about it?"

"Do you know how to dance?"

"I was supposed to once."

"Ah, then could you teach me—I mean, would you?"

"Would I? well, I think I would with some persuasion—'con mil amores,' he murmured under his breath, pressing the arm that lay in his against his side.

Dolly pushed herself away from him angrily:

"I should like to know what excuse you had to answer me like that."

"You asked if I would teach you—"

"And you might have said yes or no, as a gentleman would."

"Well?"

"But you answer offensively, in words you could n't say in English."

"Could n't I! Would you like to hear how they sound in English? I told you the simple truth. Would I teach you to dance, you asked me, and I said I would with a thousand loves—and I will, with a thousand thousand! To dance or to anything else I know and it befits you to know."

"Befits! I have no words—I declare I cannot tell you how I *hate* the way you treat me! Your insufferable patronage, your air of being always so superior—and then your stupid school-boy freedoms! If I am serious, you make fun of me; if I play, you take advantage. I wish you would do either the one thing or the other."

"Yes," breathed Philip. "Only tell me which."

"Either leave me alone entirely, or treat me—treat me like a woman—a person of sense."

Dolly sat down in a dolorous heap on the landing-step, and buried her face in her handkerchief; her shoulders shook as if she were crying.

"I will, Dolly." He took the place on the step beside her. "How shall I treat this person of sense?"

"You spoil everything. You are making fun of me now," Dolly sobbed, and by the same impulse began to laugh immoderately.

Philip waited till she became quieter. "If I am to treat you like a woman, dear, I shall have to spoil things more—very much indeed. And things might be a good deal worse between us—worse for me. That is why I have waited."

Dolly, with her face still hidden, shook her head impatiently.

"To be plain with you is one way," he continued. "The other is simply impossible. It's no

use pretending I could live in the same house with you and leave you alone entirely; I'm not 'superior' enough for that. Shall we be serious, then? I know I often hit the wrong note trying to make sounds that mean nothing, because I have to avoid the one note that would go to my soul. Would it spoil things very much if you knew that I love you, dear?"

Dolly would not look up. He could see only a bit of her neck, above the collar, and the curve of one little crimson ear.

"I shall ask for nothing. But please get used to the fact. Come, take my hand! It need not worry you or make any difference; only remember, and forgive me when I blunder. And let us talk and laugh and quarrel as we did before. Why do you hide your face? Am I never to look at you again?"

"Not at dinner," Dolly specified.

"Not at dinner, then: but shall we not ride?"

"Oh, yes," she sighed in a tone of relief. "I wish we were on horseback now."

It was Saturday night, and they rode to the cañon, the three young ones together, Duns-muir taking the team home alone. Alan rode ahead, and sometimes he sang in his loud, expressionless tenor; and Philip noted that he had a new song, a very tender one—"Aforrado de mi vida." It suited Philip exquisitely; it voiced his aching dream. "Lining of my life"; "slen-der bit lassie"; soul of the mystic soul of beauty, dear little human comrade without whom the lights and shadows of the world were nothing; foretold to her lover by every hope, withheld by every fear!

She rode with her face to the west; her pale face, her hands, her hair, were as luminous as flowers at evening in a dusk border. Over the west, from horizon to zenith, spread a marvelous copper-pink glow, a light without a shadow, while all the land beneath was dark. Low in that sublimated west Venus shone forth at her setting, the one star in the heavens, though crowds awaited the lifting of twilight's colored curtain. The radiance deepened; it changed to lurid brassy hue. The sage-green hills turned vivid; the aspens shivered and paled against the cold, purple east. The night-wind, creeping down the gulches, breathed its first long sigh.

They checked their horses, and signed to one another to look at the hills. Slowly the strange fulgence was withdrawn; diffusing, to concentrate later on a lower key, to pause and softly brighten to the tender verge of starlight; and then the wind would blow, and no heart not strong in happiness could bear that senseless riot and rapture, prolonged throughout the night, under wild reaches of midnight sky, under the white stride of the Milky Way; with soundings of the river's stops; with whisperings midst the poplars' dusky files—cowed shapes

against the dark, closing and parting, with rifts of stars between. As their horses jostled down the sidling trails, often his knee was against her saddle-girth; and once he took her hand, silently, without question, and she let it stay, while she made hurried little speeches about the view, which he did not attempt to answer. His heart was full; he took deep breaths of resolution to be patient,—perhaps even generous,—since, until the work was done, all the cañon days, and most of the evenings, were his in which to win one little girl who had seen no one else (Dolly's chances were not so many that he need have hurried her). But never would he allow her to pass the cañon's bounds without her promise. How would the story of the Sleeping Beauty have ended had the Prince waited to tell his love until the Princess had awakened to more than just himself and the dull old palace of her dreams? If all the world loves a lover, all the world knows that he is selfish.

## XIV.

MARGARET felt herself superseded in these days, and thought that the pressure of waiting was nothing to the estrangements of success. Dolly was sweet, sometimes over-sweet, in speech and manner; but she was absent in mind, variable in spirits, inconstant about her work, and less and less with Margaret, as time went on, and more and more with Philip. Matters went often "agley" in the housekeeping. The marketing, which had been Job's business in town, on Wednesdays and Saturdays, was now the business of no one in particular, where everybody was so driven by the work. Mistakes were made, and there were loose expenditures that harrowed Margaret's soul. There was a constant bustle of coming and going, and company not expected, and meals out of season. After the petty routine of years, Margaret had lost the knack of doing things quickly. And Duns-muir was one who hated explanations. He never listened to them, never gave them if he could help it. Thus he misunderstood many little domestic situations, which he settled offhand, peremptorily and sometimes unjustly, sooner than talk things over, as the women loved to do. But Margaret could no longer count upon Dolly. It goes hard with one lone woman when the child of her arms who once understood understands no longer, or has ceased, perhaps, to care. Once Margaret had had her douce little man every night to comfort her with his wise silence and moderate judgment, but now she saw him only Sundays, in a constrained, unhomelike way; she would not take this time to complain of things too trivial to be saved up; yet they made the sum of a strain which was beginning to tell upon her temper and health and spirits.

It had not occurred to Dolly that Margaret could have anything to complain of. She had never asked, but she supposed that her father must have paid his debt; what could he be doing else with his salary, which seemed wealth to Dolly? She knew nothing of the cost of Western living, nor of the debts in town to people who were not so patient as Job and Margaret, or not so helpless. The wash was supposed, now, to go below to a Chinaman at the camp; but Margaret had heard of the heathen custom of mouth-sprinkling, and, week by week, she snatched from pollution what she called the pick of the wash, and did it herself, and got little credit for doing it. She saw with dismay that the bed- and table-linen was going fast, nor could Dunsmuir be induced to replace it, according to her ideas of economy, with cheaper stuff, fit to be tossed about in the common wash and whipped to rags on the line by winds that came laden with dust.

"Have we no more linen in the house?" Dunsmuir would demand, when Margaret mentioned buying. There was linen, to be sure, a sacred store laid by in trust for Dolly—Margaret would have been ashamed, indeed, of her stewardship had there not been fine old glossy Scotch damask, and sheeting wide and heavy, with beautiful embroidered markings, tied with ribbons, in piles of dozens and half-dozens, and fragrant with dried rose-leaves and with lavender. But long before she had got through this explanation, Dunsmuir would cut her short.

"Use what we have. What are you saving it for, woman? Do ye think I cannot buy my daughter her marriage linen, if ever she come to want it?"

"Maybe, then, ye 'll ken how many pund sterling went t' the fillin' of thae kists ye 're sae blythe of emp'ying."

But though Margaret had in a measure her say, she had not her will. No more linen was bought, and she was forced to visit the "kists" more than once, reducing the sacred hoard, at what cost to her pride and her feelings no one in the house took the trouble to understand. Dolly had taken an irritating way of rousing herself, periodically, to an unwonted critical interest in the house, when she would do over portions of Margaret's work without advising her or stating her objections. This was as much as the older woman could bear; and at times she saw no good reason why she should stay where even her work failed to satisfy. Yet she felt that never had Dolly needed her as now, though the child knew it not. Margaret watched her, in her light but perilous intercourse with the first young stranger she had known, distrusting Philip, distrusting the powers of nature to protect Dolly from pitious delusions, distrusting the whole connec-

tion, business and social, with the sinister house of Norrison. She would stand her ground, was her determination, though all should feel her in the way. Both Dunsmuir and Dolly were as children, misled and bedazed, in Margaret's eyes.

Meanwhile a trouble of her own was creeping upon her, and she failed to read the warnings. Job had come, one Sunday, in a sad condition of bruises; she was ashamed to have him seen of the family. He had had a fall, he told her; but it seemed a simple thing, for a man of his age, to tumble off his own cabin steps in broad day. She upbraided him for clumsiness; she even suspected a more discreditable cause, and repented the suspicion afterward with tears. On another Sunday he complained of his head, and spoke heavily of the work as though it were too much for him. Margaret thought her man was getting babyish; it ill consorted with their circumstances that he should be discouraged with work at fifty-five. It fretted her that he seemed to grow forgetful of things she told him, of messages and errands; his slowness of speech seemed to have affected his comprehension. She was often impatient with him, often irritable, while he grew more stolid, it seemed, and often slept away the greater part of the one day they had together. More than once he spoke as if he expected her to keep house for him in the autumn at their homestead, quite as if she were a young, untrammelled girl. It irritated her, after all that had come and gone, to have to explain that she could not leave her child alone in a family of men-folk, with a Chinaman in the kitchen who would take advantage, and waste the food and fuel, and break the dishes and hide the pieces, and warp the brooms, and use the best towels to clean the paint. Job should know these things without words; and the words were forgotten by the next Sunday, and the delusion abided that she belonged to none but him, and was free to go when he asked her. She was the more round with him that she was conscious herself of a secret leaning toward the same folly. Both she and Job were too old to work at the pleasure of others. They needed their own times, and to work in their own way. This Margaret felt, but saw no way to indulge the weakness; and she had no more hesitation sacrificing Job to the family than herself, for was he not her "man"?

One Sunday he told her that she must make up her mind, for he had given notice of his intention to "quit" work for the company. Word had gone forth that the water would be down as far as his land by the following spring, and if they were to benefit by it, it was none too soon to get their land in shape. He had waited too many years now, he said, to lose the first season.

Margaret was astonished at Job's forthputtingness, venturing to make such a decision without consulting her. However, the thing was done; he could not be off and on with a job like that. It gave some shadow of excuse, she was weak enough to own, to her own desertion. The bitterest part of that business was the evidence of her senses, sharpened by feeling that no one felt it as she did. Dolly did not realize—how should she, who had always had a Margaret?—what it would be not to have one. And she was as happy as a child in the prospect of visiting Margaret in her own house; she had never had a place to visit. She was busy, too, sorting over her closets and bureaus for little additions to Margaret's humble outfit; jellies and canned fruits and dishes that could be spared, and towels and napkins and pillows, from the hoard Margaret had

guarded. These things Margaret flatly refused with a flushed and tearful face,—would she rob the house, indeed?—but they were packed and smuggled into the wagon without her knowledge.

Nothing, since Alan's frank desertion to the commercial side of the scheme, had hurt Duns-muir like the sight of that honest pair, with their boxes and humble effects piled around them, jolting out of sight down the cañon road with the knowledge they would never come back as they went. It would so have comforted Job and Margaret had they known; but Duns-muir was too proud to dwell upon his sentiments to these people to whom he owed hard money. In a month or two he hoped to make all square; he would take that opportunity to speak of the greater debt—the one beyond return.

(To be continued.)

*Mary Hallock Foote.*

## SONNET.

[W. J. WINCH.]

CARRY us captive, thou with the strong heart,  
 And the clear head, and nature sweet and sound!  
 Most willing captives we to thy great art  
 And thee together, held in chains and bound.  
 Never the angels sang at heaven's gate  
 In more divine, pure, noble, perfect tones.  
 Beside thy gift what then is royal state,  
 And what are pomps and powers, and kings and thrones?  
 Sing, and we ask no greater joy than this,  
 Only to listen, thrilling to the song,  
 Breathing a finer air, a loftier bliss,  
 Than to the dim and cloudy earth belong;  
 Borne skyward, where the wingéd hosts rejoice,  
 On the great tide of thy melodious voice!

*Celia Thaxter.*

## MY SHELL.

A SHELL upon the sounding sands  
 Flashed in the sunshine, where it lay:  
 Its green disguise I tore; my hands  
 Bore the rich treasure-trove away.

Within, the chamber of the pearl  
 Blushed like the rose, like opal glowed;  
 And o'er its domes a cloudy swirl  
 Of mimic waves and rainbows flowed.

"Strangely," I said, "the artist-worm  
 Has made his palace-lair so bright!  
 This jeweler, this draftsman firm,  
 Was born and died in eyeless night.

"Deep down in many-monstered caves  
 His miracle of beauty throve;  
 Far from all light, against strong waves,  
 A Castle Beautiful he wove.

"Take courage, Soul! Thy labor blind  
 The lifting tides may onward bear  
 To some glad shore, where thou shalt find  
 Light, and a Friend to say, 'How fair!'"

*Theodore C. Williams.*

# THE PHILOSOPHY OF RELATIVE EXISTENCES.

BY FRANK R. STOCKTON.

**L**N a certain summer, not long gone, my friend Bentley and I found ourselves in a little hamlet which overlooked a placid valley, through which a river gently moved, winding its way through green stretches until it turned the end of a line of low hills and was lost to view. Beyond this river, far away, but visible from the door of the cottage where we dwelt, there lay a city. Through the mists which floated over the valley we could see the outlines of steeples and tall roofs; and buildings of a character which indicated thrift and business stretched themselves down to the opposite edge of the river. The more distant parts of the city, evidently a small one, lost themselves in the hazy summer atmosphere.

Bentley was young, fair-haired, and a poet; I was a philosopher, or trying to be one. We were good friends, and had come down into this peaceful region to work together. Although we had fled from the bustle and distractions of the town, the appearance in this rural region of a city, which, so far as we could observe, exerted no influence on the quiet character of the valley in which it lay, aroused our interest. No craft plied up and down the river; there were no bridges from shore to shore; there were none of those scattered and half-squalid habitations which generally are found on the outskirts of a city; there came to us no distant sound of bells; and not the smallest wreath of smoke rose from any of the buildings.

In answer to our inquiries our landlord told us that the city over the river had been built by one man, who was a visionary, and who had a great deal more money than common sense. "It is not as big a town as you would think, sirs," he said, "because the general mistiness of things in this valley makes them look larger than they are. Those hills, for instance, when you get to them are not as high as they look to be from here. But the town is big enough, and a good deal too big; for it ruined its builder and owner, who when he came to die had not money enough left to put up a decent tombstone at the head of his grave. He had a queer idea that he would like to have his town all finished before anybody lived in it, and so he kept on working and spending money year after year and year after year until the city was done

and he had not a cent left. During all the time that the place was building hundreds of people came to him to buy houses or to hire them, but he would not listen to anything of the kind. No one must live in his town until it was all done. Even his workmen were obliged to go away at night to lodge. It is a town, sirs, I am told, in which nobody has slept for even a night. There are streets there, and places of business, and churches, and public halls, and everything that a town full of inhabitants could need; but it is all empty and deserted, and has been so as far back as I can remember, and I came to this region when I was a little boy."

"And is there no one to guard the place?" we asked; "no one to protect it from wandering vagrants who might choose to take possession of the buildings?"

"There are not many vagrants in this part of the country," he said; "and if there were, they would not go over to that city. It is haunted."

"By what?" we asked.

"Well, sirs, I scarcely can tell you; queer beings that are not flesh and blood, and that is all I know about it. A good many people living hereabouts have visited that place once in their lives, but I know of no one who has gone there a second time."

"And travelers," I said; "are they not excited by curiosity to explore that strange uninhabited city?"

"Oh, yes," our host replied; "almost all visitors to the valley go over to that queer city—generally in small parties, for it is not a place in which one wishes to walk about alone. Sometimes they see things, and sometimes they don't. But I never knew any man or woman to show a fancy for living there, although it is a very good town."

This was said at supper-time, and, as it was the period of full moon, Bentley and I decided that we would visit the haunted city that evening. Our host endeavored to dissuade us, saying that no one ever went over there at night; but as we were not to be deterred, he told us where we would find his small boat tied to a stake on the river-bank. We soon crossed the river, and landed at a broad, but low, stone pier, at the land end of which a line of tall grasses waved in the gentle night wind as if they were sentinels warning us from entering the silent city. We pushed through these, and

walked up a street fairly wide, and so well paved that we noticed none of the weeds and other growths which generally denote desertion or little use. By the bright light of the moon we could see that the architecture was simple, and of a character highly gratifying to the eye. All the buildings were of stone and of good size. We were greatly excited and interested, and proposed to continue our walks until the moon should set, and to return on the following morning—"to live here, perhaps," said Bentley. "What could be so romantic and yet so real? What could conduce better to the marriage of verse and philosophy?" But as he said this we saw around the corner of a cross-street some forms as of people hurrying away.

"The specters," said my companion, laying his hand on my arm.

"Vagrants, more likely," I answered, "who have taken advantage of the superstition of the region to appropriate this comfort and beauty to themselves."

"If that be so," said Bentley, "we must have a care for our lives."

We proceeded cautiously, and soon saw other forms fleeing before us and disappearing, as we supposed, around corners and into houses. And now suddenly finding ourselves upon the edge of a wide, open public square, we saw in the dim light—for a tall steeple obscured the moon—the forms of vehicles, horses, and men moving here and there. But before, in our astonishment, we could say a word one to the other, the moon moved past the steeple, and in its bright light we could see none of the signs of life and traffic which had just astonished us.

Timidly, with hearts beating fast, but with not one thought of turning back, nor any fear of vagrants,—for we were now sure that what we had seen was not flesh and blood, and therefore harmless,—we crossed the open space and entered a street down which the moon shone clearly. Here and there we saw dim figures, which quickly disappeared; but, approaching a low stone balcony in front of one of the houses, we were surprised to see, sitting thereon and leaning over a book which lay open upon the top of the carved parapet, the figure of a woman who did not appear to notice us.

"That is a real person," whispered Bentley, "and it does not see us."

"No," I replied; "it is like the others. Let us go near it."

We drew near to the balcony and stood before it. At this the figure raised its head and looked at us. It was beautiful, it was young; but its substance seemed to be of an ethereal quality which we had never seen or known of. With its full, soft eyes fixed upon us, it spoke:

"Why are you here?" it asked. "I have said to myself that the next time I saw any of you I would ask you why you come to trouble us. Cannot you live content in your own realms and spheres, knowing, as you must know, how timid we are, and how you frighten us and make us unhappy? In all this city there is, I believe, not one of us except myself who does not flee and hide from you whenever you cruelly come here. Even I would do that, had not I declared to myself that I would see you and speak to you, and endeavor to prevail upon you to leave us in peace."

The clear, frank tones of the speaker gave me courage. "We are two men," I answered, "strangers in this region, and living for the time in the beautiful country on the other side of the river. Having heard of this quiet city, we have come to see it for ourselves. We had supposed it to be uninhabited, but now that we find that this is not the case, we would assure you from our hearts that we do not wish to disturb or annoy any one who lives here. We simply came as honest travelers to view the city."

The figure now seated herself again, and as her countenance was nearer to us, we could see that it was filled with pensive thought. For a moment she looked at us without speaking. "Men!" she said. "And so I have been right. For a long time I have believed that the beings who sometimes come here, filling us with dread and awe, are men."

"And you," I exclaimed—"who are you, and who are these forms that we have seen, these strange inhabitants of this city?"

She gently smiled as she answered: "We are the ghosts of the future. We are the people who are to live in this city generations hence. But all of us do not know that, principally because we do not think about it and study about it enough to know it. And it is generally believed that the men and women who sometimes come here are ghosts who haunt the place."

"And that is why you are terrified and flee from us?" I exclaimed. "You think we are ghosts from another world?"

"Yes," she replied; "that is what is thought, and what I used to think."

"And you," I asked, "are spirits of human beings yet to be?"

"Yes," she answered; "but not for a long time. Generations of men, I know not how many, must pass away before we are men and women."

"Heavens!" exclaimed Bentley, clasping his hands and raising his eyes to the sky, "I shall be a spirit before you are a woman."

"Perhaps," she said again, with a sweet smile upon her face, "you may live to be very, very old."

But Bentley shook his head. This did not

console him. For some minutes I stood in contemplation, gazing upon the stone pavement beneath my feet. "And this," I ejaculated, "is a city inhabited by the ghosts of the future, who believe men and women to be phantoms and specters?"

She bowed her head.

"But how is it," I asked, "that you discovered that you are spirits and we mortal men?"

"There are so few of us who think of such things," she answered, "so few who study, ponder, and reflect. I am fond of study, and I love philosophy; and from the reading of many books I have learned much. From the book which I have here I have learned most; and from its teachings I have gradually come to the belief, which you tell me is the true one, that we are spirits and you men."

"And what book is that?" I asked.

"It is 'The Philosophy of Relative Existences,' by Rupert Vance."

"Ye gods!" I exclaimed, springing upon the balcony, "that is my book, and I am Rupert Vance." I stepped toward the volume to seize it, but she raised her hand.

"You cannot touch it," she said. "It is the ghost of a book. And did you write it?"

"Write it? No," I said; "I am writing it. It is not yet finished."

"But here it is," she said, turning over the last pages. "As a spirit book it is finished. It is very successful; it is held in high estimation by intelligent thinkers; it is a standard work."

I stood trembling with emotion. "High estimation!" I said. "A standard work!"

"Oh, yes," she replied with animation; "and it well deserves its great success, especially in its conclusion. I have read it twice."

"But let me see these concluding pages," I exclaimed. "Let me look upon what I am to write."

She smiled, and shook her head, and closed the book. "I would like to do that," she said, "but if you are really a man you must not know what you are going to do."

"Oh, tell me, tell me," cried Bentley from

below, "do you know a book called 'Stellar Studies,' by Arthur Bentley? It is a book of poems."

The figure gazed at him. "No," it said presently; "I never heard of it."

I stood trembling. Had the youthful figure before me been flesh and blood, had the book been a real one, I would have torn it from her.

"O wise and lovely being!" I exclaimed, falling on my knees before her, "be also benign and generous. Let me but see the last page of my book. If I have been of benefit to your world; more than all, if I have been of benefit to you, let me see, I implore you—let me see how it is that I have done it."

She rose with the book in her hand. "You have only to wait until you have done it," she said, "and then you will know all that you could see here." I started to my feet, and stood alone upon the balcony.

"I AM sorry," said Bentley, as we walked toward the pier where we had left our boat, "that we talked only to that ghost girl, and that the other spirits were all afraid of us. Persons whose souls are choked up with philosophy are not apt to care much for poetry; and even if my book is to be widely known, it is easy to see that she may not have heard of it."

I walked triumphant. The moon, almost touching the horizon, beamed like red gold. "My dear friend," said I, "I have always told you that you should put more philosophy into your poetry. That would make it live."

"And I have always told you," said he, "that you should not put so much poetry into your philosophy. It misleads people."

"It did n't mislead that ghost girl," said I.

"How do you know?" said he. "Perhaps she is wrong, and the other inhabitants of the city are right, and we may be the ghosts after all. Such things, you know, are only relative. Anyway," he continued, after a little pause, "I wish I knew that those ghosts were now reading the poem I am going to begin to-morrow."

## TEARS.

NOT in the time of pleasure  
 Hope doth set her bow;  
 But in the sky of sorrow,  
 Over the vale of woe.

Through gloom and shadow look we  
 On beyond the years:  
 The soul would have no rainbow  
 Had the eyes no tears.

*John Vance Cheney.*

## BEACHED.

According to a superstitious observance among certain fisher-folk, the recovered boat of a drowned fisherman has ended its sphere of usefulness, and is beached, with curses and solemn imprecations by the assembled neighbors. A reference to the custom is made in "A Daughter of Fife," by Amelia E. Barr.

HEY have left her all alone, with her keel turned to the sun ;  
They have left her, with a curse, for the deed that she has done.

Only sunbeams lave her sides, as they float out to the west ;  
Only sand-drifts kiss the bow, where the sparkling wave has  
pressed.

Even little children pause and grow silent, with great eyes,  
To point their rosy hands in awe upon her where she lies.

The laden boats go by, with their snowy sails outspread ;  
The merry laughter echoes on the shore beside the dead ;

Not a thought from those who prized her, that she knew well, face to face ;  
Not a glance upon the sea-starved one, so lonely in disgrace.

They have left her all alone, with her keel turned to the sun ;  
They have left her, with a curse, for the deed that she has done.

Throughout the long night, waves sob the tale unto the tide ;  
And she writhes in her anguish, and she moans in her pride.

And her strong heart-timbers shrink through the quivering summer day,  
And the thirsty beams cry out for one touch of salty spray.

They have left her all alone, with her keel turned to the sun ;  
They have left her, with a curse, for the deed that she has done.

Oh, the pity in the fisher's hut, where lights burn dim and low !  
Oh, the great nets idly drying, as the swift tides come and go !

Oh, the empty platters waiting, when the oaken board is spread !  
Oh, the rude hearts broken, breaking, with the breaking of the bread !

Back she came, with ragged mainsail, plowing through a veil of foam,  
Like a frightened steed a-quiver, pressing for the gates of home ;

In the roar and in the tempest, she had weathered through the gale,  
But her humble sun-browned lovers came not back beneath her sail.

They have left her all alone, with her keel turned to the sun ;  
They have left her, with a curse, for the deed that she has done.

*Virginia Frazer Boyle.*

## ARCHITECTURE AT THE WORLD'S COLUMBIAN EXPOSITION.— III.

O the building for the department of Electricity was assigned an area 350 feet on the court and 700 feet long, the major axis running north and south. Though peculiarly fortunate in its site, having an important frontage on the lagoon as well as on the court, it was the smallest building of the principal group. It thus became incumbent on its architects, Messrs. Van Brunt & Howe of Kansas City, so to design this building that it should not be overwhelmed by the superior mass of its neighbors, and that, if possible, it might have such characteristics as should at once conceal and justify its inferiority of size; which inferiority, however, is only comparative, the actual area to be occupied being considerably in excess of that covered by the Capitol at Washington. Its purposes seemed to suggest a playful animation of outline, somewhat like that of the early French Renaissance in the châteaux, approaching even the fantastic joyousness of Chambord, combined with a certain delicacy or preciousness of detail, which might legitimately differentiate it from the rest in regard to expression, while, in respect to general style and feeling, and in loyalty to scholastic types, it should still belong to the same architectural family.

The area is conveniently divisible into 23-foot squares by two systems of parallel lines crossing at right angles. Upon the intersection of these lines the columns and piers of the exterior and interior are placed. This module of 23 feet, being somewhat less than that adopted for the other buildings, assists in carrying into execution that more delicate scale of design, that nervousness of movement and avoidance of massiveness, which, as we have intimated, seem to be suggested by the idea of electricity. It soon became evident that the space set aside for this department of the Exposition, though covering 4.85 acres, would be insufficient to meet the demands of exhibitors, unless the largest possible amount of floor-space which could be gained within it should be made available to them. This at once suggested a second story of flooring, covering as large a space as the necessary openings for the admission of day-

light from the roof into the central parts of the first story would admit. To obtain the obvious advantages of grand central avenues in both directions, it was clear that the building should be crossed by longitudinal and transverse naves, open from floor to roof and free from columns. The module of 23 feet enters fifteen times into the width of the building. Five of these modules, or 115 feet, are taken for the width of the naves, and they are covered with pitched roofs, supported by steel arched trusses, set 23 feet on centers, and lofty enough to permit a line of clearstory windows to be elevated above the rest of the building, which, for its part, is divided into five aisles on each side of the longitudinal nave, each one module wide, and these are covered with continuous flat roofs, with a series of skylights over the central aisles corresponding with openings in the second floor. Access to these galleries is obtained by grand staircases, one on each side of each of the four main central porches.

The main exterior architectural expression depends upon these simple primary conditions. Where these high naves abut against the center of each of the four façades, an important entrance pavilion is naturally established. As for the inclosing architectural screen walls around the rest of the building, the interior module of 23 feet naturally produces a corresponding series of divisions into bays, which must be 60 feet high to the cornice for the sake of that unity of style agreed upon for all the court buildings. These screen walls are hardly long enough to permit the arrangement of the bays in groups or large divisions, without by this means drawing attention to that comparative inferiority of size which it appeared to be the obvious duty of the architects to conceal or condone; nor do the conditions of the plan suggest such groups or divisions anywhere except in the center of each front. Each bay, therefore, is made complete in itself, and is so devised as to admit of repetition all around the building, interrupted only by such slight breaks, with variations of *motif*, as are essential to illustrate the plan, to furnish bases for frequent towers, and to prevent the monotony from becoming mechanical and fatiguing, but not of sufficient emphasis to clash with that expression of continuity which is recognized as an important element in noble architecture, and which, in the present case, is an echo of the plan.

DRAWN BY E. ELSON DEANE.

THE ELECTRICITY BUILDING.

VAN BRUNT & HOWE, ARCHITECTS.

CARL ROHL SMITH, SCULPTOR.

STATUE OF BENJAMIN FRANKLIN FOR ELECTRICITY BUILDING.

Now the horizontal line, which is the predominant characteristic of all classical buildings, implies dignity and repose. But the present object is to obtain in some way an expression of brightness and movement. To this end the piers, regularly spaced, 23 feet on centers, along the façades, are treated as boldly projecting pilasters, resting upon a stylobate

8 feet high, which is made continuous to prevent the composition from becoming disjointed, but having the cornice and the paneled attic above the cornice broken around them. Each pilaster, so emphasized and detached, is finished with a pedestal upholding a staff for banners and for a constellation of electric lights, thus carrying the vertical line lightly to the sky, and securing an effect somewhat similar to that of a pinnacled buttress. This order of piers, or pilasters, is adjusted to the proportions and details of the highly enriched Corinthian of Vignola. Between each pair of pilasters the bay is divided horizontally, on the line of the gallery floor, by a subordinate Ionic entablature, supported by two jamb pilasters and by a central column of that order, the space above being treated with an arch deeply embayed. Behind this architectural screen are placed the windows, set in bronze frames. These openings occupy an unusually large proportion of the wall-veil, because of the necessity of throwing abundant light across the five ranges of aisles in both stories. Near each end of the façades this continuity of similar open bays is relieved, or punctuated as it were, by a solid bay of the same width, but of slightly increased projection, pierced with a small window in each story, the upper one having a balcony supported by sculptured brackets. The narrow pavilions thus formed are finished on the attic line with highly enriched pediments, and form the basis of a more emphatic expression of vertical energy by supporting in each case a slender open campanile of the Composite order, rising suddenly from behind the balustrade of a platform, on the corners of which are planted tall candelabra with groups of electric globes. On the long fronts, midway between each end pavilion and the central

porch, the succession of similar bays is again broken by a postern doorway, set in a narrow intermediate and subordinate pavilion, crowned with a low square dome decorated with eagles.

As we have already intimated, where the transept abuts against the center of the long east and west fronts, an important central pavilion is developed. In pursuance of the scheme of this design, which is to take advantage of every opportunity to emphasize its vertical elements, this pavilion is flanked by two towers, one bay wide and three bays apart. Each of the towers supports an open belvedere, crowned with a high, round attic, decorated with festoons and vases, and roofed with a stilted dome, after the manner of Sir Christopher Wren. Each of these belvederes finishes with a girandole, 195 feet from the ground, furnished with a corona of incandescent lights under a reflecting canopy. Between these towers projects a flat-roofed portico, composed of columns 42 feet high, continuous with the order of Corinthian pilasters of which we have spoken, arranged upon a plan with rounded corners, so that, by the necessary multiplication of breaks and returns in the entablature at the angles, the seriousness of the more classic *motif* might be tempered to the lighter mood to which the architecture of this building is committed. Above is a high Composite attic with windows, set between the towers, and finishing with a balustrade, decorated with obelisks. Twenty-three feet behind this balustrade the gabled end of the transept roof may be seen.

The north front, toward the picturesque lagoon, being, by its position, relieved to a certain extent from strict conformity to the classic ideal, seemed to invite a greater freedom of treatment than was admissible elsewhere. Here, therefore, the order of the façades, after

passing the point of demarcation furnished by the corner pavilions, is made to sweep around two apsidal projections, 115 feet in diameter, between which is recessed the north porch, composed of two towers, similar to those of the east and west porches, flanking a broad central pavilion, pierced with a great arched

DRAWN BY E. ELDON DEANE.

PORCH OF ELECTRICITY BUILDING.

window, corresponding with the arch-lines of the steel trusses in the long nave, and divided by transoms and mullions. The sky-line between these towers is made horizontal, and the spandrel panels of the arch are occupied by gigantic reclining figures typifying Investigation and Discovery. The porch is formed by the Ionic order of the façades, which is extended between the apses in the form of an arcade of five arches supporting a wide terrace or balcony.

Up to this point, for the reasons stated, the design of the Electricity Building is characterized by an emphasis of vertical expression un-

usual in academical architecture, the sky-line being fretted by ten campaniles, varying in height from 154 to 190 feet, and by the four square intermediate domes, which mark the position of the posterns. But, on the south front, it was necessary to make a concession to that spirit of grandeur and ceremony which should prevail around the great court of the Exposition. Accordingly the vertical line, predominant elsewhere in the building as a foil to its long, low, horizontal mass, is here subordinate to the spirit of repose. To this end the campaniles on the corners are set back from the front, but connected with it by gabled pavilions, 23 feet wide, and the principal entrance of the building on this side is treated as a triumphal arch, 60 feet wide and 92 feet high, of which the archivolt springs from the main cornice as an impost, the jambs being formed of coupled full columns of the main order with corresponding pilasters. This arch is crowned with a classic pediment containing an escutcheon, which bears the electromagnet as a symbol of electricity, and is supported on each side by a female figure representing the two principal industries connected with this science—electric lighting and the telegraph. Above, in contrast with the somewhat fantastic movement of the sky-lines elsewhere, rises a solid elevated attic, forming a severe horizontal outline against the sky. This central mass is buttressed on each side by great consoles, supporting emblematic statues and resting on pedestals, continuous with the clearstory of the nave, and embellished with medallions of Morse and Vail, the American discoverers of the electric telegraph. The most famous and most cherished association of America with the history of the science of electricity is the discovery of the electric properties of lightning by Franklin. The architects determined, therefore, that a statue of the patriot-philosopher should stand under this great arch, and that to him the main porch on the court should be dedicated. This work was intrusted to the Danish-American sculptor, Mr. Carl Rohl Smith, whose conception of the subject is happily realized in a spirited figure, 15 feet high, representing Franklin as the philosopher, with the historic kite and key, observing the storm-clouds. This noble statue is elevated on a high pedestal in the center of the porch, and behind and over it is formed a colossal niche, of which the triumphal arch is the frame, covered with a half dome or conch, divided by ribs, and profusely enriched with bas-reliefs, recalling, in general aspect, the much admired hemicycle or belvedere in the court of the Vatican palace, and, in detail, the characteristic stucco embellishments in the vaults of the Villa Madama. Around its curved walls is carried the great order of the building,

with grouped pilasters. On the main frieze of this niche is written the famous epigram of Turgot in honor of Franklin:

ERIPUIT COELO FULMEN SCEPTRUMQUE  
TYRANNIS.

In the five bays of the niche are the main doorways, three of which, in the back, open into the central nave; the other two, toward the front, give access to an open ambulatory or portico, which forms the first story of the court frontage of the building. To this portico the subordinate Ionic order of the façades is arranged to form a screen, with two detached columns in each bay. Upon the frieze of this order, where it occurs in the hemicycle, appear the names of the most famous deceased Americans connected with electricity: Henry, Morse, Franklin, Page, and Davenport; while outside, upon the same frieze, in alphabetical order all around the building, are the names of sixty-six great electricians of all ages and countries, whose names have passed into history. The fame of living electricians must rest upon their displays within the structure.

So far as practicable, the decorations of this building are devised to suggest its uses, the conventional embellishments of the orders being varied by the frequent recurrence of the electromagnet and lamp, and the recesses of the hemicycle and porticos being enriched with color. It is intended also to illuminate and emblazon the architectural features at night with an electric display of unprecedented interest and magnitude.

The architectural modeling of this building was done under a contract with the Phillipson Decorative Company of Chicago, the sculpture of the main pediment being from the hand of Mr. Richard Bock of Chicago.

THE suggestion which has been made that that part of the Electricity Building toward the lagoon would permit of a freer treatment, by reason of the more natural conditions in the landscape of that region as compared with the artificial character of the court, has a much larger and more important application. All the buildings which we have been considering, because they formed a distinct group, and inclosed an area where art was everything and nature nothing, were for obvious reasons developed according to classic formulas. It seemed proper that, in this entrance-court of the World's Exposition, the world should be received with a formal and stately courtesy, illustrated and made intelligible by an architecture which is the peculiar expression and result of the highest civilizations of history. It was like the use of the Latin language, which, by monumental

usage, lends dignity to modern inscriptions, and, by tradition, embalms the liturgical service of the Roman Catholic Church. For reasons equally obvious, the other buildings, which are mainly in charge of the local architects, and which are to be placed in a region where natural conditions are intended to prevail, might receive a development much less restricted in regard to style, and, by following more romantic lines, might be more happily adjusted to their surroundings. These surroundings invite picturesqueness, freedom — qualities peculiarly grateful to American genius, which is naturally impatient of authority and discipline. But we think it will be seen that the architects of Chicago have known how to express these qualities without that license which unhappily is also American; yet with an exuberance, or even joyousness, entirely consistent with refinement of feeling, and in every way appropriate to an occasion of high national festival.

Because of its intermediate position, the Electricity Building may perhaps be considered, in some respects, a transition between these two extremes of architectural thought. At all events, in its sister building, that of Mines and Mining, which occupies a site next west of the Electricity Building, lies parallel with it, and is of nearly the same dimensions, the architect, Mr. S. S. Beman of Chicago, has made a frank departure from the pure-classic tradition, exhibiting an adaptation of form to use, of means to ends, in entire conformity with the practical spirit, without caprice, and without sacrifice of any essential quality of art. The contrast between these two buildings clearly illustrates how even the conventional forms of architecture may be so handled as to express a fundamental difference of sentiment, corresponding to the difference of occupation.

Mr. Beman's plan

for the Mining Building is included within construction-lines giving an extreme length of 700 feet and an extreme width of 350, and he has found it convenient, for reasons hereafter to be explained, to establish  $21\frac{1}{2}$  feet as a general module of dimension in laying out his construction. The general scheme of an interior the greater part of which is to be occupied by masses of classified ores, by heavy mining appliances of all kinds, and other bulky exhibits requiring large space and considerable clear height, should provide for a wide, central, open area as little encumbered by columns as possible. Thus the preliminary consideration of this problem seemed to point directly to a study of construction. The roofing of large

DRAWN BY H. G. RIPLEY.

SOUTH PORCH OF MINES BUILDING.

spaces under similar conditions for the Pullman Company had prepared Mr. Beman to apply a valuable practical experience to the conditions here presented, the result of which was that he was enabled to roof in an area 230 feet wide by 580 feet long (60 feet inside his boundaries all around) by the use of a very light and elegant system of cantaliver trusses, supporting a longitudinal central louver with clearstory lights, and bearing upon two rows of steel columns, spaced lengthwise  $64\frac{1}{2}$  feet on centers (or three of the modules above noted), and, transversely, 115 feet; the outer ends of these cantalivers being anchored to two corresponding rows of columns  $57\frac{1}{2}$  feet outside of the inner rows. It would be difficult to devise a simpler, a more economical, or a more effective distribution of constructive features. The extreme height of this shed-roof is 94 feet in the center and 44 feet at the bottom of the slope.

The main practical object of the building being thus happily attained, it remained for the architect to surround this center shed or nave with a system of two-storied aisles 60 feet wide, covered with a continuous louvered roof provided with clearstories for light. The conjunction of roof-slopes, where the aisles and the central nave are joined, creates a valley from which the water can be conducted in spouts carried down with the outer line of main columns. Nothing could be more workmanlike and more practical than this whole arrangement.

However much or however little of decorative character may be permitted on the envelop or inclosure of a building of this sort, it cannot be elevated into the domain of architecture unless this inclosure is developed rationally from the essential conditions of structure behind it, and is in some way made expressive of its uses. Moreover, in the present case it is essential that it should be brought, as a whole, into the great architectural family of which it is to form a part, by any concession or adjustment that may be found most convenient. At the outset it would seem that the uses of the building, the comparatively coarse and rough character of the exhibit within, require a massive treatment of the exterior, and that the architectural language employed should in general be such as to express this idea, as it is capable of expressing every

DRAWN BY C. A. VANDERHOOF.

RICHARD W. BOCK, SCULPTOR.

STATUE OF "GODDESS OF FORTUNE."

sentiment, however various, desirable to be conveyed in building as a fine art. It naturally follows that the unusual distribution of the interior supports of the roof structure,  $64\frac{1}{2}$  feet on centers, should be expressed in the architectural scheme of the exterior on the sides by a corresponding distribution of piers, and that these piers should be made massive, as if constructed with heavy rusticated masonry laid up in marked horizontal courses. In order to give additional emphasis to these expressive buttresses of strength, the whole entablature or cornice of the building is broken around them, and they are surmounted by decorated pedestals or so-

cles supporting banner-staffs. Considerations of proportion give to these piers a width of 10 feet. It also follows logically that the wide bays between these great piers are divided into three segmentally arched divisions of one module each, corresponding to the spacing of the minor supports of the gallery floor; which, in its turn, compels the establishment of a horizontal paneled division in each of these arched divisions, thus forming the first- and second-story window-openings needed for the proper illumination of the building. In all their divisions and subdivisions, therefore, these bays are developed from the structure by growth, and not forced upon it by caprice.

The necessity of bringing the north and south ends of the design into a common scale of height with the court buildings, at the points where comparison is challenged between them, suggests the raising of the main cornice here to a level 11 feet higher than that established on the long fronts by structural conditions. These ends are thus converted into distinct façades of seven great bays, the two corner bays and the central bay in each becoming marked as pavilions, the former being 60 feet wide, to correspond with the width of the inclosing galleries behind them, and the latter, which, from considerations of proportion, grows into a width of 80 feet, becoming the main portal of the building. In all cases the massive and buttress-like character of the piers is insisted on, and, in order to preserve the unity of the design, each constitutes the pedestal of a banner-staff, thus conferring the conventional holiday aspect on a sky-line which might otherwise appear too serious and severe for association with the other buildings of the group. The larger scale of the north and south fronts and their more monumental character have suggested the occupation of each of these seven bays by a great arch, those on the corner pavilions being

closed with windows, and the intermediate arches being open with a two-storied loggia behind; but in the central bay the idea of the portal compels the raising of its cornice, the crowning of it with a highly decorated frontispiece in pedimental form, and a marked increase in width, height, and depth of the arch, which is not divided by the loggia of the second story. The superior height and development of this feature also seems to mask the glazed gable-end of the great roof of the central hall; which, however, may be seen in perspective 60 feet behind the line of frontage. The corner bays are furnished with visible low domical roofs supporting circular lanterns. In order to obtain a necessary amalgamation between the monumental masses which form the ends of the building and the long inferior curtain-wall with its nine bays on the east and west sides, it is found necessary in the central bay of these sides to establish a proportionate distribution of masses by repeating in it the motive of the corner bays with their higher entablature, and by crowning it with a pediment, treating the archway as a subordinate entrance or exit in the middle of the long fronts.

Mr. Beman has not attempted to follow the historical styles with precision. Indeed, the logical development of his façades has necessarily conferred upon them a proper modern character. We, however, may see here the influence of the example of the great modillion cornices of the Italian palaces of the sixteenth century, and much other Italian detail of the best eras, mingled with some of the elegant license of the modern Renaissance of France; and in the treatment of the balconies of his loggia, and of the Doric order which upholds them, we may discover a return to the Rome of the Cæsars. The sculpturesque modeling of this building was executed in the ateliers of the Phillipson Decorative Company of Chicago.

Mephisto among the  
Manuscripts*

AURELIA WEST, on witnessing the departure of her Italian acquaintance from Flüelen, by the grandest of all the routes leading down into his own native country, had supposed herself irretrievably devoted to the Teutonic side of the Alps, and reasonably beyond the reach and influence of any other land or race. Had she not just passed within a few hundred yards of the Rütli, still flourishing greenly with the memories of mountain freedom? Was she not now within a mile or two of the birthplace of the liberator and hero of the land? Had she not beheld within the last hour the monumental rock commemorating at once the hero and his poet? Was she not now surrounded on every hand by scenery the noble grandeur of which might well match and offset even such name and fame? Aye, truly. How pitiful, then, that a wall dingily stuccoed and rudely lettered with the simple word *albergo* should so put the unthrif and melody of Italy before her as to wipe out completely the glorious Vierwaldstätter See, and make all Switzerland as but a thing that was not! How deplorable that the good-natured clamor of a company of untidy, uncoated young fellows playing tenpins with the ordinary sprinkling of *sei* and *sette* and *otto*, and no more than the usual allowance of *adesso* and *allora*, should have been equal to the canceling of the lines on Tell's own pedestal, and even able to obliterate the lofty inscription on the Mythenstein itself! To think that Schiller and William Tell, and Altdorf and the Axenstrasse and the Frohnalpstock, and other Teutonicalities innumerable, should have been bowled over and sent flying helter-skelter by the hand of an ignorant, unwashed Italian peasant! To think that one who had but to pick and choose among the multiplied magnificences of all Helvetia should, even for a single moment, experience an unreasoning impulse to forego Leman and Lucerne, Pilatus and the Jungfrau, the Tête Noire and the Gemmi, the Oberland and the Dolomites, in order to plunge headlong across the St. Gothard and make one's instant way to Como and Venice and Rome! But such is Italy.

<sup>1</sup> Copyright, 1891, by Henry B. Fuller.

This was the acute and incongruous emotion that sported with Aurelia West as she stood before the Tell statue at Altdorf, and a feeling not altogether dissimilar — being different in degree only, and not in kind — came over her after the first day or two of their stay in Salzburg. They were on the extreme northern edge of the Alps, and yet there were many things in the aspect of the place to suggest that they might be on the extreme southern edge. Aurelia did not fully apprehend the complication of considerations that had combined to this effect; she did not know that frequent conflagrations had well nigh wiped out the bristling awkwardness of German medievalism, or that the magnificent but mistaken tastes of a long line of baroque bishops had favored the Italian influence in architecture no less than in music; but she had some sense of the moderation and restraint shown everywhere in the skylines, and the various domes and church-towers, and fountains and palace-fronts, seemed almost unbroken reflections of Fontana and Bernini and Maderno. Indeed the handsome quays along the Salzach might almost have come from Pisa; the high-perched old fortress up on the Mönchsberg suggested Bellinzona, or even the Belvedere at Florence; the outlines of the encircling mountain-amphitheater, with the Hochstaufen, the Untersberg, the Tennengebirge and the rest, seemed sufficiently suave and fluent to harmonize with the other features of the panorama; while from every convent and abbey — Benedictine, Ursuline, Franciscan — came subtle whiffs of a somber, uncompromising, and poetically mysterious Catholicism. It seemed like Italy; indeed, it almost was Italy — Italy in a blond wig.

Nor was Aurelia long in discovering that in leaving the Lake of Uri for the valley of the Salzach they had simply exchanged one hero for another. Patriotism gave way to melody; Tell was supplanted by Mozart. The fanatical frenzy of the musical amateur appeared early and in all its virulence both in Zeitgeist and the Governor, and it became evident that as long as they remained in Salzburg — most exquisitely lovely of all German towns though it be — nature was to take a place secondary to art. They visited in rapid and regular course the house where Mozart was born, the house in which he subsequently lived, that other house (removed hither all the way from Vienna and set up on the Kapuzinerberg across the river) in which he composed certain of his works, and also that other house where manuscripts, portraits, and piano combine to make a veritable little Mozart museum. Zeitgeist caressed with a shining eye the faded physiognomy of that meager little clavier, and the young women gave

forth a sympathetic sigh as they scanned the painted lineaments of its one-time owner, but the Governor's attention was almost completely concentrated on the manuscripts; a thousand musical bees were already buzzing in his bonnet, and he was coming to feel that to leave Salzburg without a leaf or two of copy from the master's own hand would be to confess their visit pitifully resultless indeed.

But he was prepared to be very reasonable in his demands; he would make a point of keeping his expectations quite within the bounds of moderation. To hope for a loose page from the "Zauberflöte" or the "Entführung" would be unwise; to look for a bit of scoring out of one of the great symphonies would be absurd. But something — any little thing at all, however small, however simple — should be, must be, found: a scrap from some one of all those numberless masses, a trifling set of exercises for the piano; though truly the thing he most desired was some little sonatina or other arranged for cello, piano, and the *flauto traverso* — an unlikely combination, indeed, but still among the possibilities. Included in their lodgings on the quay there was a dimmed old rococo salon of the last years of the last century, and it had struck him that an evening of chamber-music there — a kind of memorial service, read, as it were, from the master's original manuscript — would not be inappropriate. He seated the Chatelaine at the *passé* piano, dressed her in brocade, powdered her hair, canopied her with loves and graces, and illuminated her with clusters of wax-lights. Zeitgeist and he completed the group, but they were both indeterminate in costume, and not too plainly in view; while Fin-de-Siècle and Aurelia West merely existed negatively, and quite outside the frame, as audience. To provide the proper *pabulum* for such a feast he would use any fair means, and if fair means were found to fail, then he would use —

Aurelia West lent herself sympathetically to the Governor's idea; she had some sense of the fit, the effective, the pictorial, and she was already revolving plans of her own, according to which the Chatelaine was to be shown properly situated, attended, circumstanced; but Fin-de-Siècle held quite aloof — apparently — from all this musical madness. He had but an imperfect sympathy for any form of art whose method of expression was such as to make impossible the incorporation of criticism. What expression of opinion was there in a fugue? What point could possibly be maintained by a sonata? Why should the artist, pen in hand, choose to content himself with the inarticulate, when the articulate itself, with all its wonderful opportunities for comment, criticism, controversy, was within equal reach and of infinitely

greater influence? How infinitely better to argue than to rhapsodize; how much finer to judge than to create; how far superior the commentator to the mere fancier!

It was from the heights of the Kapuzinerberg, well above the monastery and none too many steps from the threshold of Mozart's own house, that Fin-de-Siècle was waving with so much energy, and hardly less sincerity, the red flag of modernity. Across the river lay the old town, penned in by the long heaving sweep of the ragged and uneasy Mönchsberg, and above the high-heaped towers of Hohen-Salzburg the last segment of the rocky, snow-flecked amphitheater began to lapse away easily into the featurelessness of the Bavarian plain. Below them, in the square between the quay and the towered flank of the cathedral, rose the statue of the immortal composer himself, and before this presence the oriflamme flaunted by Fin-de-Siècle took on, in the Governor's eye, a tinge more sanguinary still. To find the mainspring of art in a criticism of life, as a certain great *Anglais* had expressed it, was, he declared, absurd; to base it on a fondness for the representation of life, like a certain acute *Américain*, was better, though inadequate: but to see art both as the exercise and the result of a trained self-expression—a self-expression prompted by the inner necessities of the individual—was better still. From this point of view the main consideration was the artist himself; he must look to it that his self-expression was adequate, correct, emollient. The artist was the exact opposite of the polemist, the one expressing himself, the other impressing himself; nor should one ignore the fact that the value of words, in an age of words, was likely to be overestimated. The second consideration involved the circle to whom the artist made his close, immediate appeal, as well as those impressionable outsiders, unknown to him personally, but presumed to exist somewhere in a state of receptive and responsive sympathy. The third consideration was the—but for the artist absolute, the artist pure and simple, there is no public. As regarded other art-workers, those prompted by emulation, request, mimicry, or necessity to duplicate, imitate, extend the work resulting from the exercise of this first creative impulse, there was a word for them: one man is an artist, another is "artistic"; just as one man is a gentleman while another is only a "gentlemanly person." Really, the great thing was that the artist should feel the prompting of the creative spirit in him, and should realize the relief that comes from an outward and sensible expression of the inward and the insensible. Then it was largely a question of selection, proportion, arrangement, presentation; and even if the outward form were partial, broken, ob-

scure, fragmentary—the Governor paused and glanced modestly askance. His thoughts had turned toward Aventicum, and he hoped that some one might see the way to weaving a laurel wreath and placing it upon his brow then and there. But no one offered to, and he made the mortified resolve that the next time he went fishing he would use a bigger bait.

Zeitgeist did not feel prompted to go out of his way to support Fin-de-Siècle, but he disliked to see the Governor put himself deliberately in the wrong by ruthlessly classing art-workers of the second rank among the amateurs. Taste and technic, he thought, were enough, without creative intelligence, to put a man among artists and to keep him there. The idea, however, that the artist was the central point in his own circle he accepted readily enough; and the other idea, too, that the artist's proper and primary appeal was to his own circumference. Had not the Salzburg master himself declared that no one should try to be a composer save him who wrote because he must? And had he not to a lavish and unprecedented degree showered his own quick-coming fancies, for the asking, or less, upon friends, family, associates, mere acquaintances? What other spirit, indeed, would have made chamber-music what it was—the great feature of the greatest musical age? Chamber-music, in fact, was this young man's besetting dissipation. His apprehension of music was mainly intellectual; he delighted in the tough, the abstruse, the over-technical. He trudged on in the treadmill of a fugue with a light-footed alacrity, and could follow a subject in double counterpoint from the score with absolute avidity. A lady had once told him that the playing of his quartette was tiresome. To whom? he had asked. To her, she had replied. And then he had quieted her by saying that chamber-music was meant to interest, not the listeners, but the performers. As for the Governor, his delight was wholly in his own work. He played quite indifferently, but he took more pleasure in the uncertain pippings of his own flute than in any sevenfold chorus of hallelujahs and harping symphonies in which he had no share. I doubt if even the very harmony of the spheres would have seemed quite to his taste, unless resulting in part from the puckering of his own lips.

But it was idle to stand disputatiously on the panoramic height of the Kapuzinerberg in expectation that some chance breeze from below might waft them up a page of manuscript; so during the course of the day the Governor repaired to a certain small shop in an obscure part of the town where, as a friend had advised him, he might be able to satisfy his requirements. It was in a street close to the base of the Mönchsberg, against whose steep rise the houses were

attached, and in whose side they were partly excavated. The place was in charge of a substantial matron, who drew her hand across her mouth with a kind of anticipatory relish, and who jostled aside a collection of dusty and dented curios to make space for the spreading out of her musical merchandise. She had something to show, and she knew it; she opened up in a way that more than redeemed the promise of the place, and that made the Governor's wish seem not so very difficult of gratification, after all. She had not only Mozart—that was merely the beginning. She had Gluck, Haydn, Mendelssohn; Rossini, hotchpotchy, an omelet in notes; Liszt, bizarre, erratic, a playing to and fro of chain-lightning; a letter of Beethoven's, a sad jumble; a page of Rousseau, the slow, painstaking momentumlessness of the half-amateur; and bits of the local master *à discretion*. One of these last Zeitgeist held in his hand, studying it long and carefully. Then he handed it over to the Governor and asked him if it were possible to detect in such pen-work any peculiarity of character or temperament that could properly, even possibly, explain the life and death that the composer was made to live and die. What other manuscripts of all those lying around them could compare with Mozart's in care, order, regularity, lucidity?—a golden mean between the downright, bull-headed vigor of Bach and Handel on the one hand, and the over-delicate, too refined touch of Chopin, or the morbid and nebulous page of Schubert on the other; a pattern of arrangement, of moderation, of general reasonableness that almost, indeed, grazed the commonplace. The general course of his life, too, had exhibited the same effect of moderation, self-possession, and decorum that his manuscripts displayed. His father, a sober and exemplary Christian, had given his childhood instruction (if such extraordinary and mysterious precocity in all matters musical can be said to have received or required instruction), and had accompanied his youth and early manhood (an exceptionally filial one) with advice and watchful care. Accustomed from his earliest years to the most ungrudging, most unbounded recognition of his marvelous gifts, he had earnestly struggled on in a career which he felt his own qualifications demanded and deserved. His was a nature foreign to excesses of whatever kind; in the main he was temperate, self-controlled—he kept himself well in hand. His disposition was noticeably sunny and sanguine; his personality was peculiarly sympathetic and winning. His self-respect, while an active quality, was not so bumpiously self-assertive as to put him at an undue disadvantage in the society of the day, while his name and fame received an early and wide

effusion through France, the academies, conservatories, and theaters of Italy, and all the courts of Germany. But—

The Governor could not escape the pitiful force of this *but*. He gave a faint sigh, and absent-mindedly creased and re-creased the dingy leaflet in his hand, quite unconscious of the indignant impatience of the shopwoman. Yes, he declared; here, if anywhere, was reason for belief in the active interference of a malignant fate in human affairs; no career that he was at all acquainted with showed such a disheartening discrepancy between cause and effect—such a painful, inexplicable hitch between means and end. It was not enough to say that Mozart was naturally something of an innovator, and was too absorbedly bent on the free vent of his own copious fancyings to keep within academic bounds: Gluck had broken through the bars more completely, and had compelled recognition in a widened field. It would not do to say that the line between the musician and the servant was not drawn very clearly in that day, and that where all the great families—the Esterhazys, the Gallitzins, the Lichtensteins—maintained complete orchestras, and ordered new symphonies and serenatas just as they ordered new coats or new table-cloths, the very number of musicians employed would work against the full recognition of the individual. Haydn, under these conditions, had made himself a permanent and respected place. It was not well to lay too great stress on the clouds of infinitesimal and multitudinous cabalists that swarmed and stung on every stage to the desperation of the composer and his sympathizers: all the other composers of the day labored under the same disadvantage as well. It would not be greatly to the purpose to say that the astounding precocity of Mozart's childhood had prejudiced his subsequent career; for the boy who at four composed pieces for the clavier, at six astonished the monks of Waserburg by his performance on the organ, at seven rebuked the slow appreciation of the Pompadour, and at fifteen conducted his own opera at Milan to the wonder and admiration of all Italy, never received an iota of appreciation from his chief patron and most evil of all evil stars, the Archbishop of Salzburg, who fed him at table with valets and cooks, and who rewarded the complete dedication of his time and talent by an honorarium of two ducats a year. Indeed, the more one pondered the case the more one was tempted to escape from its meshes by recourse to reasons too puerile, too simple, to be accepted by many as reasons at all. Was it not probable that Mozart, with his enjoyment of familiar human intercourse, showed too great a facility in sliding down to meet non-genius on its own plain, common,

every-day level; no pretension, no attention; no claims, no consideration? And was it not more than likely that most of Mozart's misfortunes came from his peculiarly insignificant physique, in a day when "presence" counted for so much? What chance had this poor little fellow of holding his own against the robust, overtopping prince-bishop, the lordly Hieronymus von Colloredo, with his horses and hounds, his trains of swarming servants and retainers, and the bevy of magnificent women with whom he loved to surround himself? The same chance that a butterfly has amid the belchings of some soot-blackened chimney; the same chance that a bubbling spring has against the associated spades of a crowd of clod-heaving navvies. But that such a soul should have passed away singing, as we may say, and surrounded, in all literalness, by its mates, and that the body it left behind should have been carelessly hurried to the common trench—

The exasperated shopkeeper snatched her maltreated manuscript from the Governor's unconscious hand and laid it on top of the others, which had already been placed back in their box. The Governor put his sympathies into one pocket and got his purse out of another, and came away with such purchases as *Zeitgeist's* taste and acumen, added to his own, could contrive. But all the Mozart manuscripts were not in the hands of the laity, as it presently came to be discovered. Salzburg is nothing if not ecclesiastical, and there is quite a round of churches and convents for those disposed to make the most of the place. Some of these places are inaccessible to ladies, and some of them are quite out of the question for gentlemen; but at such as were practicable for both the Chatelaine's friends were able to note how easy it was for her to slide from the secular into the devotional. The unconscious simplicity of these transitions was viewed by Aurelia West with a kind of awed embarrassment; her own devotions were of course performed only at stated intervals and under circumstances conventionally correct; she herself was more or less unable to feel the efficacy of week-day prayer, and really preferred to worship in the company of other ladies gowned and bonneted for that purpose. It surprised her a good deal to see with what an indulgent interest these extemporaneous devotions, briefly undertaken in dusky corners, were regarded by the young men, for she knew that the Chatelaine's uplifted eye found no counterpart in either of them. *Fin-de-Siècle*, far from looking up to religion, looked down upon it, while *Zeitgeist* looked aslant at it with a level gaze that claimed to see the good and the bad in every system, and to weigh them quite coolly and indifferently against each other. But they both appreciated the devo-

tional as an element in the female character, the one feeling that to the *ewigweibliche* we must look more and more for faith and imagination, and the other holding that a serious, large-eyed young woman, with a strong affinity for the *prie-dieu*, made the most charming of frontispieces—what a pity that in the best-made books of fiction a frontispiece was no longer *chic*. And neither of them, I fancy, would have resented a churchly wife.

In one of these churches, one morning, the Governor having inexplicably vanished, the young men were taking advantage of so appropriate a time and place to air their theological views. *Zeitgeist* had already upset the sacred chronology, to the scandal of Aurelia West, and *Fin-de-Siècle* was engaged in cracking a series of ornamental flourishes against the supernatural about the startled ears of the Chatelaine, when the Governor, emerging from nowhere in particular, as it seemed, came tripping toward them, to the great relief of the orthodox sex, with a twinkle in his eyes and a dusty document in his extended hand. He announced with great glee that he had just got hold of another Mozart manuscript, and he justified himself before the reproachful Chatelaine, who appeared to be suspecting some grave impropriety or worse, by a statement of the facts. He had burst unexpectedly at once into the sacristy and into a rehearsal. He had found a lank old man in a cassock seated before a music-rest in the midst of a dozen little chaps dressed in red petticoats and white over-things, and every one of those blessed choristers was singing at the top of his lungs—had any of them heard it?—his own proper part in a Mozart mass from a real Mozart manuscript. They were being kept to the mark by a pair of lay brothers who played—credible and irreverent combination!—a tuba and a bassoon; and the master had quieted his obstreperous aids, and had come straight to him in the most civil manner, and—well, here was the manuscript; twenty florins well spent. It was not a mass,—oh, dear, no; let nobody think it,—it was a little trio—*la-a-a, la la la, la-a-a*, that was the way it went. These parts, here, were for two violins, probably, but they would go well enough on the flute and the upper strings of the cello. Really it was not so difficult after all, this finding of manuscripts, and he felt that he could soon leave Salzburg quite content.

The Governor's content was raised a degree higher still a little later in the day, as he was strolling among the clipped hedges and marble statues of the old archiepiscopal pleasure behind the *Schloss Mirabell*—a garden cut after the old French mode, and as little expressive of sanctity as are the fatigued gaiety and worldly

charm of a wearied beauty just home from a ball. The Governor was all the time conscious that his was not the only pair of lungs breathing in the world-weary atmosphere of this sophisticated retreat, and he presently perceived, modestly hovering about behind a hedge of arbor-vitæ, a youth with a battered brown portfolio under his arm. The Governor was presently examining the contents of this portfolio (with an interest that did not quite rise to enthusiasm, however), and had soon committed himself to an appointment for the inspection of more Mozart manuscripts. On his return to his lodgings he found a most flattering note awaiting him from one of the dignitaries of the cathedral. A number of original manuscripts by the great Mozart had just come to light in the church library, and the Governor, as an eminent amateur, was invited to attend a private rehearsal from the same.

The next day the Chatelaine made a visit to the Ursuline convent on the Nonnberg. The Lady Superior was more than gracious, and from her own private cabinet she abstracted a bit of music which she charged the Chatelaine to convey to her distinguished relative — a little song in the own, authenticated hand of their beloved Wolfgang Amadeus. When Bertha placed this offering in her godfather's hands the old gentleman gave a quiet sigh: for a lad was then waiting below for an answer to a note that he had brought from the shop in the Gstättergasse, — other Mozart manuscripts having developed in that dusky quarter; while before him on the table lay the prospectus of a publisher who was shortly to bring out a series of Mozart quartets, just discovered. When the Governor sallied forth next morning, a seedy-looking individual who had been waiting half an hour on the pavement opposite thrust his hand into the inside pocket of a shabby coat as he came stepping rapidly across the street. But the Governor turned his head the other way, and hurried on without stopping.

On their last day they climbed up once more to Hohen-Salzburg to pay to the Canterbury of Germany the parting tribute of a final general view. They indulged in a modest little luncheon at the restaurant which offers refreshment at the entrance to the castle.

Here, while Zeitgeist was settling the score, and the rest were endeavoring to fasten a lasting impression of so much beauty on their minds, a waiter slid up confidentially alongside the Governor with his fingers fumbling in his waistcoat-pocket — Fin-de-Siècle looking on with a smile in which suspicion might have detected a trace of the sardonic. Would his lordship be pleased to look at a bit of music, genuine beyond all doubt, and written by no less a master than — The Governor turned a look of pleading expostulation upon him, collected his young people, and hurried

down the hillside in all haste. On their way to the station a boy who stood on a crossing waiting for their cab to pass jerked a paper from a bundle that he carried under his arm and thrust it out toward the Governor. The old gentleman shuddered, and commanded the cab-driver, through the other window, to prod up his lagging beast. And as the train pulled out, he sighed a sigh of relief at the thought that while the land to which they were bound was indeed a land of song, yet the music of the Tyrol was of a kind not generally committed to paper.

## VI. THE DOLOMITES: SCIENCE IN PANIC.

It is not to be supposed that the Governor passively accepted the occurrences at Salzburg as a mere series of coincidences totally disassociated from any propelling cause; but it was not until Zeitgeist made some allusion to certain social movements on the part of Fin-de-Siècle and himself, during their stay in that town, that the old gentleman began to suspect the Count (finally assured of the real nature of the retreat near Constance) of having adopted retaliatory measures. At Salzburg, Zeitgeist was within a hundred miles of home, and many of the personages in residence there were well known to him; so on his making a casual allusion to Fin-de-Siècle's sudden quickening of the social spirit, and to the satisfaction which both of them had derived from a little round of visits, the Governor was able to formulate his theory. There was nothing in Fin-de-Siècle's course that he could really resent, for one may be gorged to-day yet recover his appetite to-morrow; but he sighed to think that the young man's desire for a revenge more immediate than adequate should have so irreverently involved the great master. However, the revenge had not been without its tinge of ingenuity, for it was a Gaul who had smitten a Teuton; but it pained the Governor to feel that just as Wagner was unable to escape the wrath of associated Frenchmen at home, so Mozart should have been unable to escape the malice of a single Frenchman abroad. But then there were satisfactions: the well-known facility of the composer, and his long residence in Salzburg, made it likely enough that all those purchases were genuine, and it was pleasant to see that the appreciation of a once-neglected genius was now so great and growing.

However, no further complications ensued, for Fin-de-Siècle presently dropped away from the little party, as he had done before, and so came to no greater familiarity with the Dolomites than he had enjoyed through Axenquist and his models. It was this collection that had first drawn their attention toward those peculiar manifestations in south Tyrol, and when Zeitgeist declared that he had already been over a part of the ground, it was agreed that he should conduct the rest of them over the ground, too. There was something in the fantastic and extravagant exaggerations of that region which started up all the latent Americanism in Aurelia West; and she, who had viewed the flowingly poetic outlines of the Alban mountains from the steps of the Lateran with no particular appreciation, had risen to an enthusiastic interest over the jagged pinnacles and splintered spires by which the brain-turned Swede had portrayed the wild and fantastic outlines of the Rosengarten and the Ampezzo-Thal. The Chatelaine, too, was willing enough to forego for a while the Doric severity of the Valais to wonder over the rigid and riven Gothicity in which rose Pelmo and Tofana, and Sorapis and Antelao, and Civita and Cristallo, and Marmolata and Hohe

Schlern, and Croda Malcora—a landscape in words alone. Already they saw those lofty and rugged valleys, hedged in by cloven precipices and rimmed with a raggedness of escarped battlements, and imaged to themselves a serried succession of pale and isolated peaks starting out dim and haggard through the dawn, or glaring crudely in the dazzling sunlight, or glowing threateningly in the red flush of sunset, or rising bare and desolate and spectral in the ghastly pallors of the moonlight. Meanwhile the Governor nervously handled his little hammer, and Zeitgeist was supposed to busy himself about the roads and the inns.

Their week in the Dolomites was to be not a promenade, but a scramble—a thing assumed by the mountaineering Zeitgeist and understood well enough by the Governor and the Chatelaine, but not dreamed of by the luxurious Aurelia, who smoothly inferred a succession of drives in properly equipped vehicles, and a regular series of four-franc dinners at table d'hôte—certainly nothing less than three. So by the time they had reached Cortina, and had sat down to dinner (as persons of distinction) on the landing, Aurelia began to experience a silent but deep-set sense of injury. Rocchetta, indeed, rose invitingly across the valley; Tofana had graciously cast away its portentous cloud-drapery; Malcora opened wide its glacial and mysterious amphitheater: but all that went for nothing. For they had driven into town in a rasping, rattling, mud-bespattered something, drawn by a pony and a mule, and their meager dinner of broth and lettuce-heads and omelets was placed before them on a rough table which no friendly willingness, no anxiety to please, could smoothly cover or adequately fill. She looked protesting toward the complacently unconscious Zeitgeist, at once the general of the expedition and its commissary, as if to ask why she should ever have been brought to this rude and benighted place. Poor child! she utterly failed to realize that she was dining in state in the capital of the district, on the line of the only highway by which the region was traversed, and she was mercifully spared the knowledge that what she had already undergone was indeed only a promenade compared with that she was yet to undergo.

She rebelliously stirred her spoon around in her broth, and recurred with an intensified resentment to a little lecture which Zeitgeist had once read her for her scant appreciation of the fare and of the service of certain villages in the Haslithal and around Kandersteg. He had asked her to observe how anywhere in Switzerland, in town or hamlet, in places famous or obscure, one was certain of a good meal, well cooked and civilly served. She had tried to

extinguish him by an account of a huge caravansary in the remote regions of buttes and sage-brush, where, five hundred miles from anywhere, she had found the electric light, a full orchestra, the telephone, and all the delicacies of every season. But he had not been greatly impressed; he had rejoined that it was the general average that counted, and that a civilization which grew up out of the ground was one thing, while a civilization fetched from afar on a mortar-board and slapped on with a trowel was another. Nowhere in her country, except in a few leading establishments in the great centers, had he found acceptable fare and attention, and nowhere was civility a certainty; an uncouth, insolent "independence" upset all calculations, and really nullified many an outlay; even those who would behave not always could. Whereas on the Continent every little place, however remote, however humble, could offer palatable fare, cleanliness, and courtesy. All this she remembered, and, remembering, rebelled, though still she did not openly complain. And on the morrow they left for another place—a worse one.

For just after breakfast tidings of the most distasteful nature came to greet the Governor—from Auronzo, too, their objective point. It had been their plan to pass around the great pyramid of Antelao on to Cadore and the Titian country generally, but the new intelligence decided him to push at once over the mountains to Caprile instead, in quite the opposite direction. The word was brought by a strapping young peasant, who had been tramping and scrambling across the mountains since daylight, and who had been impelled to this exertion by a visitor now at his native place—a *forestiere*, in general; a Frenchman, in particular; an elderly individual of a very exacting and peremptory disposition; a stout walker and a mighty wielder of the geological hammer; a man of scowls and pursed lips and severely sudden turns of the head; in other words, the worthy Saitoutetplus of Neuchâtel, whose message was that he was now in the Dolomites, that he had been trying to catch up with the Governor for the last three days, and that he might be looked for in Cortina within the next twenty-four hours.

This news at once put the Governor in a tremor. The sensitive old gentleman had not met his colleague since that mortifying fiasco at Avenicum, nor did he feel himself able to face him even now. He took the presence of Saitoutetplus among the Dolomites as more than an unkindness—as something almost equaling a cruelty. He had indeed known Saitoutetplus to describe himself as a grand-nephew of the great Dolomieu, and had more than once heard him refer to a trip through

south Tyrol as among the possibilities; but his presence here now could be accounted for only on the ground of an ungenerous desire to gloat over a friend whose ardent and imaginative nature had put him at a disadvantage. So within an hour the Governor and his friends had left Cortina—the cleanly, the cheerful, the Germanic—for a long course of travel among the huddled and disheveled hamlets of Venetia, the Chatelaine seated firmly on a brown horse, Aurelia perched precariously on a sorry sorrel, the Governor straddled on an opinionative mule, and Zeitgeist trudging along on foot with the bearers of the baggage.

It was a rigorous and diversified route, and led them across lofty alps and under melancholy groves of pine, through whose openings they glimpsed the pale distortions of distant Dolomites, and at one stage their guide condemned them to an hour's scramble up the rocky bed of a dried-up torrent. It was an ordeal for all of them; and the Governor, since he alone knew why it was all undergone, was the only one who was sustained by the feeling that what he was suffering by moving was much less than what he would have suffered by remaining at rest. Pelmo and Marmolata looked down with a stony indifference on all this anguish; and when they stopped at a chalet for the refreshment of milk, only to find the place barred and bolted, and to spy the inhabitants thereof swishing their scythes on the mountain-slopes a thousand feet above their heads, the martyred Aurelia seated herself on an upturned butter-tub, and openly lamented the lost luxuries of Cortina, whose cleanly rooms now stretched out like the great state apartments of some palace, whose broths and omelets were a banquet truly fit for monarchs, and whose brisk little felt-hatted *kellnerinn* was a ministering angel indeed. And it was sunset when the vast wall of Monte Civita flashed a rosy signal to them from its pompous, organ-like front, and the compact and dingy habitations of Caprile appeared in the valley below.

The Governor and Bertha spent the next day in botanizing up the valley of the Livalungo, while Zeitgeist made a solitary feint in the direction of the Marmolata glacier. Aurelia kept her room during the entire day, not because it was a close, low-ceiled little place, with a complete command of the noise, odor, and disorder of the stable-yard, but in spite of that; and she revived her flagging energies on a diet of broth evolved from a pair of skinny and sapless fowls, not because she liked it, but because it was that or nothing. And about half-past four there came a rap on the door, and a new misfortune developed when a letter, addressed to the Governor and brought across the mountains by one of the

Cortina hostlers, was handed in to Aurelia as the sole representative of their party now on the ground. The handwriting of the address indicated great decision and indomitable solution, and the last word ended with a big splutter that seemed the mingled symbol of haste, indignation, and a grim sense of ultimate triumph. When this missive was put into the Governor's hands, fear passed on to panic and his flight was turned into a rout. The persevering Saitoutetplus was sorry, he wrote, that his first message had arrived at a time when their preparations for departure had advanced so far as to make any further delay impracticable; he was anxious to see his friend for a scientific conference of considerable importance, and he should therefore come on at once to Caprile, arriving there next day at noon. The Governor at once informed Zeitgeist and the Chatelaine that important and unexpected intelligence made it necessary for him to reach Botzen on the Brenner as soon as possible,—conveying the impression that his letter had come from that quarter,—and that they must prepare to leave Caprile for Primiero before ten o'clock the next morning.

The Governor scouted with an injured indignation the idea that Saitoutetplus's persecution had nothing behind it but a desire to discuss the geological origins of the Dolomitic region. Never would he meet the man if he could possibly avoid it; and if he were constrained to meet him in the end, still nothing, nothing in the world, could compel him to agree with him. If Saitoutetplus seemed disposed to uphold the coral-reef theory of the formation of the Dolomites, he himself should hold out for the theory of volcanic action, obsolete though it might be. If Saitoutetplus preferred the volcanic theory, then he should make up some new theory right out of his own head,—a thunder-and-lightning theory, for instance; a theory of crags splintering and crashing under the constant and concentrated fury of a thousand thousand forked and jagged thunderbolts—a theory, in fact, drawn from the heavens above and equally good with one drawn from the earth beneath or from the waters under the earth. But as for anything like an agreement between them—impossible!

The way to Primiero was a long and tangled succession of paths, lanes, footpaths, mule-tracks, wagon-roads, which led southward with faint hints of Italy in the dim blueness of distant valleys; but for the panic-driven Governor (whose every step was now taken for really no better reason than that it had a predecessor and so must have a successor) the dominant feature of the landscape was his redoubtable colleague of the college, who started up here, there, and everywhere. As they boated across the lovely lake of Alleghe, the Governor al-

most looked to see an extended arm raising above the surface of the water, not the sword of the legend, but the *vade mecum* of the geologist; the shadows cast by the lazily floating cumuli upon the broad, screen-like front of *Civita* appeared in his eyes as the image of a stubborn and contentious professor on the rostrum; while from every door and window in the piazza at Agordo a determined index-finger seemed threatening to thrust itself, with the intention of arresting the fleeting philosopher, and of having the whole matter argued out then and there.

On from Agordo the road lay through the quicksilver country; and Aurelia West, as she progressed slowly over that bare, scorched, and stifling tract, and experienced the novel sensation of the perspiration drip, drip, dripping from the tip of her nose, reverted longingly to the haymakers' chalet up above *Caprile*. How cool the wind had been there, how fresh the flowers, how pleasant the shade to the north of that rude and bedraggled wall, how refreshing the milk in its great coarse vessels (for they had found an attendant peasant at last), how glorious the lofty, wide-spread view, how particularly comfortable the seat made by that up-turned tub! The *Chatelaine*, however, went on steadily and sturdily enough, and *Zeitgeist*, who was coming to regard Aurelia with considerable impatience and resentment, had nothing but admiration for her companion. Thoroughgoing and inexorable mountaineer, he was conceiving a great admiration for a young woman whose powers were so staying, and who was so fully equal to looking after herself. She could disentangle her own stirrups, she could mount her own horse, and she had a knack of helpfully slinging the tea-bottles across her saddle. No hard scabble could wrench her ankles, no steep climb could altogether take her wind. If she fancied a flower, she scrambled for it instead of weakly yet imperatively demanding that it be brought to her; and a complexion whose soft bloom came from within rather than from without took no querulous and incessant heed of wind and weather.

On the other hand, Miss West had given him no rest. Her unceasing demands, exactions, expectations, all through Switzerland, had buzzed about his head like a swarm of gnats, and her indulgence in the superfine only as far back as *Caprile* had impelled him to tell her that that sort of thing would never do. She had reduced the willing and painstaking landlady there to a state of tears by her complaints and criticisms, and *Zeitgeist* had been obliged to tell her that the chief *Dolomite* innkeepers were not to be treated in any such fashion. They were persons of some means, position, and consequence; they were the possessors of immensely long ge-

nealogies, many of them having ranked as noble even as late as the last century; they were independent of travelers' coin, keeping open house less for profit than for public convenience; they maintained the tradition of an old-time hospitality, and were to be treated with more consideration—or at least more forbearance—than she was showing. Aurelia gulped down this information with a stony fortitude; to suffer was bad enough, but to suffer in silence—

More suffering awaited her at *Primiero*, where *Zeitgeist*, whose rôle was not to fetch and carry, to defer, and to dance attendance, unburdened himself of the vexation and indignation of a month by uttering some very pointed phrases on the tyranny of the American aristocracy. Aurelia was in a state of exhaustion approaching collapse,—a situation where invective might well have given the *pas* to generosity,—but she plucked up enough spirit to declare that there was no aristocracy in America; the aristocracy of slavery was dead and gone, the aristocracy of intellect had never existed there, or anywhere else, for that matter; and as for the aristocracy of wealth, that, she had once heard her father say to her stupid brother, was a simple matter of the here-to-day-and-gone-to-morrow kind, and might well be trusted to dispose of itself. *Zeitgeist* regarded her with a sinister satisfaction. True, the aristocracy of slavery was as dead as Pharaoh, and the aristocracy of brains was but a poetic mirage, and the aristocracy of wealth had no stability, since the talent and energy of the American usually worked itself out in a single generation; but why should anybody be deceived into imagining that a vast, settled, complicated society—a society largely urban and daily becoming more so—does not develop privilege, draw lines, and bring on the elevation of the *aristos* in one shape or another? The ultimate reaching of such a state was, under ordinary human conditions, unavoidable, and America, so far as his observation went, was now suffering under the rule of an aristocracy,—novel, indeed, but incredibly wide-spread, close-knit, firm-rooted, all-pervasive, and ultra-tyrannical,—the aristocracy of sex. He stopped in the polishing of his spectacles, and gave Aurelia a sharp and sudden look, as if to ask her what she thought of *that*. She laid hold of both arms of her chair, and braced herself for the next instalment.

What was American society, mademoiselle, but a magnificent galley in which husbands and fathers toiled at the oars, while wives and daughters sat above in perfumed idleness? He had met a gentleman in New York, the possessor of twenty millions of florins, who had told him that he was working for his board and clothes—he seemed to be employing a recognized phrase. This unfortunate toiled more

incessantly than his meanest clerk, and had absolutely not a single pleasure; but his wife and daughters, along with a hundred others like them, resided in a great hotel, without duties, insensible of any obligations, and unoccupied except by their own diversions.

Were not the corridors of society full of young men dancing and dangling after silly little girls with flowers and favors and theater-tickets, asking nothing in return but a word or a smile, and sometimes even thankful for a snub? Aurelia nodded silently. Did not woman lead man into the dining-rooms of American hotels? Did not man wait for woman's permission before bowing to her on the public street? Was not all culture, all study, all leisure, all the mechanism that worked on toward the amenities and refinements, so completely in the hands of woman that few girls of position and opportunities were able to select a satisfactory husband from their own circle? Aurelia nodded again. And yet it was in such a land as that,

the veritable paradise of woman, that the abhorrent reptile of female suffrage had reared its hideous head, and had dared to hiss out its demand for "equal rights." Was it not a shame, mademoiselle? Was—it—not—a—*shame*? But the exhausted Aurelia was far beyond the reach of argument, even when emphasized by a smart smack on the top of a table. She was asleep.

They remained at Primiero three or four days. Aurelia was glad enough to understand from the Governor that his correspondent at Botzen would no longer exact such an undue haste from them: Primiero offers a ruined castle perched on a precipitous crag, besides two or three little churches and various reminiscent scraps of history more or less Venetian, and with these Aurelia and the Chatelaine occupied themselves until the time came to move on to Predazzo—with the history, more especially, since two nights of wild weather had practically laid an embargo on locomotion. Nor had all traces of that wildness vanished by the time set for their departure from Primiero. Mud filled the roadways, mist filled the air, all the woods were full of ominous rushing sounds, and every gully echoed with the grinding and thumping of onward-hurrying stones. The way led across many a foaming torrent and through many a clammy cloud. Now and then they passed a hay-wagon wrecked and abandoned, and more than once the smaller of their donkeys, his legs lost to sight, appeared like some new aquatic creature floating on a stream of mud. And just at the point where the Chatelaine, gathered up in her bedraggled skirts and steadied by the water-soaked Zeitgeist, was running nimbly along a low wall of loosely piled stones, her weaker sister, cowed by the puddle, broke down, added her tears to those of the weeping sky, and sobbed for recollection of the road past the quicksilver-mine, when the way had been so dry, the sun so warm, the air so clear! Nor could she be consoled in any way until, upon their arrival at Predazzo, they found the diligence for Botzen standing before

the inn door. It had just come in, but it would be going back to-morrow; so here was connection with the world at large and deliverance from the wilderness.

The next afternoon, as they drew up before the diligence

bureau at Botzen, a short, stout figure clad in black broadcloth stood widely and firmly planted in the doorway; a fat, round, smooth face flashed a look of grim triumph upon the dismounting Governor, and Saitoutetplus stood confessed. The Chatelaine greeted him with all the cordiality of an old friend; Aurelia declared that had she but understood with whom the appointment had been made

she would have tried harder to bear up through their hasty, headlong flight; and the Governor, with a complicated smile, which was crowded with too many elements to allow much room for that of sincerity, expressed himself overjoyed that after all these perils, and delays, and accidents, and endeavors, a relighting fortune had permitted him to meet his dear colleague at last.

(To be continued.)

Henry B. Fuller.

## GLIMPSSES OF WILD LIFE.

I.

NY glimpse of the wild and savage in nature, especially after long confinement indoors or in town, always gives a little fillip to my mind. Thus, when in my walk from the city the other day I paused, after a half-hour, in a thick clump of red cedars crowning a little hill that arose amid a marshy and bushy bit of landscape, and found myself in the banqueting-hall of a hawk, something more than my natural-history tastes stirred within me.

No hawk was there then, but the marks of his nightly presence were very obvious. The branch of a cedar about fifteen feet from the ground was his perch. It was worn smooth, with a feather or two adhering to it. The ground beneath was covered with large pellets and wads of mouse-hair; the leaves were white with his droppings, while the dried entrails of his victims clung here and there to the bushes. The bird evidently came here nightly to devour and digest its prey. This was its den, its retreat; all about lay its feeding-grounds. It revealed to me a new trait in the hawk—its local attachments and habits; that it, too, had a home, and did not wander about like a vagabond. It had its domain, which it no doubt assiduously cultivated. Here it came to dine and meditate, and a most attractive spot it had chosen, a kind of pillared cave amid the cedars. It was such a spot as the pedestrian would be sure to direct his steps to, and, having reached it, would be equally sure to tarry and eat his own lunch there.

The winged creatures are probably quite as local as the four-footed. Sitting one night on a broad, gently rising hill, to see the darkness close in upon the landscape, my attention was

attracted by a marsh-hawk industriously working the fields about me. Time after time he made the circuit, varying but little in his course each time; dropping into the grass here and there, beating low over the bogs and bushes, and then disappearing in the distance. This was his domain, his preserve, and doubtless he had his favorite perch not far off.

All our permanent residents among the birds, both large and small, are comparatively limited in their ranges. The crow is nearly as local as the woodchuck. He goes farther from home in quest of food, but his territory is well defined, both winter and summer. His place of roosting remains the same year after year. Once, while spending a few days at a mountain lake nearly surrounded by deep woods, my attention was attracted each night, just at sundown, by an osprey that always came from the same direction, dipped into the lake as he passed over it for a sip of its pure water, and disappeared in the woods beyond. The routine of his life was probably as marked as that of any of ours. He fished the waters of the Delaware all day, probably never going beyond a certain limit, and returned each night at sundown, as punctual as a day-laborer, to his retreat in the forest. The sip of water, too, from the lake he never failed to take.

All the facts we possess in regard to the habits of the song-birds in this respect point to the conclusion that the same individuals return to the same localities year after year, to nest and to rear their young. I am convinced that the same woodpecker occupies the same cavity in a tree winter after winter, and drums upon the same dry limb spring after spring. I like to think of all these creatures as capable of local attachments, and not insensible to the sentiment of home.

But I set out to give some glimpses of the wild life which one gets about the farm. Not

of a startling nature are they, certainly, but very welcome for all that. The domestic animals require their lick of salt every week or so, and the farmer, I think, is equally glad to get a taste now and then of the wild life that has so nearly disappeared from the older and more thickly settled parts of the country.

Last winter a couple of bears, an old one and a young one, passed through our neighborhood. Their tracks were seen upon the snow in the woods, and the news created great excitement among the Nimrods. It was like the commotion in the water along shore after a steamer had passed. The bears were probably safely in the Catskills by the time the hunters got dogs and guns ready and set forth. Country people are as eager to accept any rumor of a strange and dangerous creature in the woods as they are to believe in a ghost-story. They want it to be true; it gives them something to think about and talk about. It is to their minds like strong drink to their palates. It gives a new interest to the woods, as the ghost-story gives a new interest to the old house.

A few years ago the belief became current in our neighborhood that a dangerous wild animal lurked in the woods about, now here, now there. It had been seen in the dusk. Some big dogs had encountered it in the night, and one of them was nearly killed. Then a calf and a sheep were reported killed and partly devoured. Women and children became afraid to go through the woods, and men avoided them after sundown. One day as I passed an Irishman's shanty that stood in an opening in the woods, his wife came out with a pail, and begged leave to accompany me as far as the spring, which lay beside the road some distance into the woods. She was afraid to go alone for water on account of the "wild baste." Then, to cap the climax of wild rumors, a horse was killed. One of my neighbors, an intelligent man and a good observer, went up to see the horse. He reported that a great gash had been eaten in the top of the horse's neck, that its back was bitten and scratched, and that he was convinced it was the work of some wild animal like a panther, which had landed upon the horse's back and fairly devoured it alive. The horse had run up and down the field trying to escape, and finally, in its desperation, had plunged headlong off a high stone wall by the barn and been killed. I was compelled to accept his story, but I pooh-poohed the conclusions. It was impossible that we should have a panther in the midst of us, or, if we had, that it would attack and kill a horse. But how eagerly the people believed it! It tasted good. It tasted good to me too, but I could not believe it. It soon turned out that the horse was killed by another horse, a vicious beast that had fits of murderous hatred toward its kind. The sheep

and calf were probably not killed at all, and the big dogs had had a fight among themselves. So the panther legend faded out, and our woods became as tame and humdrum as before. We cannot get up anything exciting that will hold, and have to make the most of such small deer as coons, foxes, and woodchucks. Glimpses of these and of the birds are all I have to report.

## II.

THE day on which I have any adventure with a wild creature, no matter how trivial, has a little different flavor from the rest; as when, one morning in early summer, I put my head out of the back window and returned the challenge of a quail that sent forth his clear call from a fence-rail one hundred yards away. Instantly he came sailing over the field of raspberries straight toward me. When about fifteen yards away he dropped into the cover and repeated his challenge. I responded, when in an instant he was almost within reach of me. He alighted under the window, and looked quickly around for his rival. How his eyes shone, how his form dilated, how dapper and polished and brisk he looked! He turned his eye up to me and seemed to say, "Is it you, then, who are mocking me?" and ran quickly around the corner of the house. Here he lingered some time amid the rose-bushes, half persuaded that the call, which I still repeated, came from his rival. Ah, I thought, if with his mate and young he would only make my field his home! The call of the quail is a country sound that is becoming all too infrequent.

So fond am I of seeing nature reassert herself that I even found some compensation in the loss of my chickens that bright November night when some wild creature, coon or fox, swept two of them out of the evergreens, and their squawking as they were hurried across the lawn called me from my bed to shout good-by after them. It gave a new interest to the hen-roost, this sudden incursion of wild nature. I feel bound to caution the boys about disturbing the wild rabbits that in summer breed in my currant-patch, and in autumn seek refuge under my study floor. The occasional glimpses I get of them about the lawn in the dusk, their cotton tails twinkling in the dimness, afford me a genuine pleasure. I have seen the time when I would go a good way to shoot a partridge, but I would not have killed, if I could, the one that started out of the vines that cover my rustic porch, as I approached that side of the house one autumn morning. How much of the woods, and of the untamable spirit of wild nature, she brought to my very door! It was tonic and exhilarating to see her whirl away toward the vineyard. I also owe a moment's pleasure to

the gray squirrel that, finding my summer-house in the line of his travels one summer day, ran through it and almost over my feet as I sat idling with a book.

I am sure my power of digestion was improved that cold winter morning when, just as we were sitting down to breakfast about sunrise, a red fox loped along in front of the window, looking neither to the right nor to the left, and disappeared amid the currant-bushes. What of the wild and the cunning did he not bring! His graceful form and motion were in my mind's eye all day. When you have seen a fox loping along in that way you have seen the poetry there is in the canine tribe. It is to the eye what a flowing measure is to the mind, so easy, so buoyant; the furry creature drifting along like a large red thistle-down, or like a plume borne by the wind. It is something to remember with pleasure that a muskrat sought my door one December night when a cold wave was swooping down upon us. Was he seeking shelter, or had he lost his reckoning? The dogs cornered him in the very doorway, and set up a great hubbub. In the darkness, thinking it was a cat, I put my hand down to feel it. The creature skipped to the other corner of the doorway, hitting my hand with its cold, rope-like tail. Lighting a match, I had a glimpse of him sitting up on his haunches like a woodchuck, confronting his enemies. I rushed in for the lantern, with the hope of capturing him alive, but before I returned the dogs, growing bold, had finished him.

I have had but one call from a coon, that I am aware of, and I fear we did not treat him with due hospitality. He took up his quarters for the day in a Norway spruce, the branches of which nearly brushed the house. I had noticed that the dog was very curious about that tree all the forenoon. After dinner his curiosity culminated in repeated loud and confident barking. Then I began an investigation, expecting to find a strange cat, or at most a red squirrel. But a moment's scrutiny revealed his coonship. Then how to capture him became the problem. A long pole was procured, and I sought to dislodge him from his hold. The skill with which he maintained himself amid the branches excited our admiration. But after a time he dropped lightly to the ground, not in the least disconcerted, and at once on his guard against both man and beast. The dog was a coward, and dared not face him. When the coon's attention was diverted the dog would rush in; then one of us would attempt to seize the coon's tail, but he faced about so quickly, his black eyes gleaming, that the hand was timid about seizing him. But finally in his skirmishing with the dog I caught him by the tail, and bore him safely to an open flour-barrel, and he was our prisoner. Much amusement

my little boy and I anticipated with him. He partook of food that same day, and on the second day would eat the chestnuts in our presence. Never did he show the slightest fear of us or of anything, but he was unwearied in his efforts to regain his freedom. After a few days we put a strap upon his neck and kept him tethered by a chain. But in the night, by dint of some hocus-pocus, he got the chain unsnapped and made off, and is now, I trust, a patriarch of his tribe, wearing a leather necktie.

The skunk visits every farm sooner or later. One night I came near shaking hands with one on my very door-stone. I thought it was the cat, and put down my hand to stroke it, when the creature, probably appreciating my mistake, moved off up the bank, revealing to me the white stripe on its body and the kind of cat I had saluted. The skunk is not easily ruffled, and seems to employ excellent judgment in the use of its terrible weapon.

Several times I have had calls from woodchucks. One looked in at the open door of my study one day, and, after sniffing a while, and not liking the smell of such clover as I was compelled to nibble there, moved on to better pastures. Another one invaded the kitchen door while we were at dinner. The dogs promptly challenged him, and there was a lively scrimmage upon the door-stone. I thought the dogs were fighting, and rushed to part them. The incident broke in upon the drowsy summer noon, as did the appearance of the muskrat upon the frigid December night. The woodchuck episode that afforded us the most amusement occurred last summer. We were at work in a newly planted vineyard, when the man with the cultivator saw, a few yards in front of him, some large gray object that at first puzzled him. He approached it, and found it to be an old woodchuck with a young one in its mouth. She was carrying her kitten as does a cat, by the nape of the neck. Evidently she was moving her family to pastures new. As the man was in the line of her march, she stopped and considered what was to be done. He called to me, and I approached slowly. As the mother saw me closing in on her flank, she was suddenly seized with a panic, and, dropping her young, fled precipitately for the cover of a large pile of grape-posts some ten or twelve rods distant. We pursued hotly, and overhauled her as she was within one jump of the house of refuge. Taking her by the tail, I carried her back to her baby; but she heeded it not. It was only her own bacon now that she was solicitous about. The young one remained where it had been dropped, keeping up a brave, reassuring whistle that was in ludicrous contrast to its exposed and helpless condition. It was the smallest woodchuck I had ever seen, not

much larger than a large rat. Its head and shoulders were so large in proportion to the body as to give it a comical look. It could not walk about yet, and had never before been above ground. Every moment or two it would whistle cheerily, as the old one does when safe in its den and the farm dog is fiercely baying outside. We took the youngster home, and my little boy was delighted over the prospect of a tame woodchuck. Not till the next day would it eat. Then, getting a taste of the milk, it clutched the spoon that held it with great eagerness, and sucked away like a little pig. We were all immensely diverted by it. It ate eagerly, grew rapidly, and was soon able to run about. As the old one had been killed, we became curious as to the fate of the rest of her family, for no doubt there were more. Had she moved them, or had we intercepted her on her first trip? We knew where the old den was, but not the new. So we would keep a lookout. Near the end of the week, on passing by the old den, there were three young ones creeping about a few feet from its mouth. They were starved out, and had come forth to see what could be found. We captured them all, and the young family was again united. How these poor half-famished creatures did lay hold of the spoon when they got a taste of the milk! One could not help laughing. Their little shining black paws were so handy and so smooth; they seemed as if incased in kid gloves. They thrive well upon milk, and then upon milk and clover. But after the novelty of the thing had worn off, the boy found he had encumbered himself with serious duties in assuming the position of foster-mother to this large family; so he gave them all away but one, the first one captured, which had outstripped all the others in growth. This soon became a very amusing pet, but it always protested when handled, and always objected to confinement. I should mention that the cat had a kitten about the age of the chuck, and as she had more milk than the kitten could dispose of, the chuck, when we first got him, was often placed in the nest with the kitten, and was regarded by the cat as tenderly as her own, and allowed to nurse freely. Thus a friendship sprang up between the kitten and the woodchuck, which lasted as long as the latter lived. They would play together precisely like two kittens; clinch and tumble about and roll upon the grass in a very amusing way. Finally the woodchuck took up his abode under the floor of the kitchen, and gradually relapsed into a half-wild state. He would permit no familiarities from any one save the kitten, but each day they would have a turn or two at their old games of rough-and-tumble. The chuck was now over half-grown, and procured his own living. One

day the dog, who had all along looked upon him with a jealous eye, encountered him too far from cover, and his career ended then and there.

In July the woodchuck was forgotten in our interest in a little gray rabbit which we found nearly famished. It was so small that it could sit in the hollow of one's hand. Some accident had probably befallen its mother. The tiny creature looked spiritless and forlorn. We had to force the milk into its mouth. But in a day or two it began to revive, and would lap the milk eagerly. Soon it took to grass and clover, and then to nibbling sweet apples and early pears. It grew rapidly, and was one of the softest and most harmless-looking pets I had ever seen. As my family was away for a month or more, the little rabbit was the only company I had, and it helped to beguile the time immensely. In coming in from the field or from my work, I seldom failed to bring it a handful of red clover blossoms, of which it became very fond. One day it fell slyly to licking my hand, and I discovered it wanted salt. I would then moisten my fingers, dip them into the salt, and offer them to the rabbit. How rapidly the delicate little tongue would play upon them, darting out to the right and left of the large front incisors, the slender paws being pressed against my hand as if to detain it! But the rabbit proved really untamable; its wild nature could not be overcome. In its large box-cage or prison, where it could see nothing but the tree above it, it was tame, and would at times frisk playfully about my hand and strike it gently with its fore feet; but the moment it was liberated in a room or let down in the grass with a string about its neck, all its wild nature came forth. In the room it would run and hide; in the open it would make desperate efforts to escape, and leap and bound as you drew in the string that held it. At night, too, it never failed to try to make its escape from the cage, and finally, when two thirds grown, succeeded, and we saw it no more.

### III.

How completely the life of a bird revolves about its nest, its home! In the case of the wood-thrush, its life and joy seem to mount higher and higher as the nest prospers. The male becomes a fountain of melody; his happiness waxes day by day; he makes little triumphal tours about the neighborhood, and pours out his pride and gladness in the ears of all. How sweet, how well-bred, is his demonstration! But let any accident befall that precious nest, and what a sudden silence falls upon him! Last summer a pair of wood-thrushes built their nest within a few rods of my house, and when the enterprise was fairly launched and the

mother-bird was sitting upon her four blue eggs, the male was in the height of his song. How he poured forth his rich melody, never in the immediate vicinity of the nest, but always within easy hearing-distance! Every morning, as promptly as the morning came, between five and six, he would sing for half an hour from the top of a locust-tree that shaded my roof. I came to expect him as much as I expected my breakfast, and I was not disappointed till one morning I seemed to miss something. What was it? Oh, the thrush has not sung this morning. Something is the matter; and recollecting that yesterday I had seen a red squirrel in the trees not far from the nest, I at once inferred that the nest had been harried. Going to the spot, I found my fears were well grounded; every egg was gone. The joy of the thrush was laid low. No more songs from the tree-top, and no more songs from any point, till nearly a week had elapsed, when I heard him again under the hill, where the pair had started a new nest, cautiously tuning up, and apparently with his recent bitter experience still weighing upon him.

After a pair of birds have been broken up once or twice during the season, they become almost desperate, and will make great efforts to outwit their enemies. The past season my attention was attracted by a pair of brown thrashers. They first built their nest in a pasture-field under a low, scrubby apple-tree which the cattle had browsed down till it spread a thick, wide mass of thorny twigs only a few inches above the ground. Some blackberry briars had also grown there, so that the screen was perfect. My dog first started the bird, as I was passing by. By stooping low and peering intently I could make out the nest and eggs. Two or three times a week, as I passed by, I would pause to see how the nest was prospering. The mother-bird would keep her place, her yellow eyes never blinking. One morning as I looked into her tent I found the nest empty. Some night-prowler, probably a skunk or fox, or maybe a black snake or red squirrel by day, had plundered it. It would seem as if it was too well screened: it was in such a spot as any depredator would be apt to explore. "Surely,"

he would say, "this is a likely place for a nest." The birds then moved over the hill a hundred rods or more, much nearer the house, and in some rather open bushes tried again. But again they came to grief. Then, after some delay, the mother-bird made a bold stroke. She seemed to reason with herself thus: "Since I have fared so disastrously in seeking seclusion for my nest, I will now adopt the opposite tactics, and come out fairly in the open. What hides me hides my enemies: let us try greater publicity." So she came out and built her nest by a few small shoots that grew beside the path that divides the two vineyards, and where we passed to and fro many times daily. I discovered her by chance early in the morning as I proceeded to my work. She started up at my feet and flitted quickly along above the plowed ground, almost as red as the soil. I admired her audacity. Surely no prowler by night or day would suspect a nest in this open and exposed place. There was no cover by which they could approach, and no concealment anywhere. The nest was a hasty affair, as if the birds' patience at nest-building had been about exhausted. Presently an egg appeared, and then the next day another, and on the fourth day a third. No doubt the bird would have succeeded this time had not man interfered. In cultivating the vineyards the horse and cultivator had to pass over this very spot. Upon this the bird had not calculated. I determined to assist her. I called my man, and told him there was one spot in that vineyard, no bigger than his hand, where the horse's foot must not be allowed to fall, nor tooth of cultivator to touch. Then I showed him the nest, and charged him to avoid it. Probably if I had kept the secret to myself and let the bird run her own risk the nest would have escaped. But the result was that the man, in elaborately trying to avoid the nest, overdid the matter; the horse plunged, and set his foot squarely upon it. Such a little spot, the chances were few that the horse's foot would fall exactly there; and yet it did, and the birds' hopes were again dashed. The pair then disappeared from my vicinity, and I saw them no more.

*John Burroughs.*

## THE GREAT PLAINS OF CANADA.

WITH PICTURES BY FREDERIC REMINGTON.

**T**HE northern portions of the two great continents which make up the non-insular land surface of the globe afford room for great plain areas wholly unlike, in extent at least, any similar areas in other latitudes. On both continents these broad

tracts are very much alike in general features. They lie well toward the Arctic Ocean; they slope gradually toward the northern sea; their river-systems converge toward the pole; and they are scantily wooded and mostly covered with nutritious grasses. Marshes of great extent abound, and such lakes and inland seas as exist are shallow and more or less brackish in character. At the northern edge of the continents the surfaces sink more and more to the sea-level; the streams grow sluggish and broad; and the frozen sea invades the land in countless inlets, bays, and channels, leaving above the surface many low, swampy islands, which are little more than mud-banks.

No one, I think, who is acquainted with the great plains of our own western continent lying north of the great lakes can read the narratives of the expeditions sent out in search of the *Jeannette* explorers, or Mr. George Kennan's accounts of Siberian travel, without being impressed with the likeness suggested between the Asiatic steppes and the "Great Lone Land" of the western hemisphere. Many of Mr. Kennan's descriptions of the country through which he passed on his memorable journey to the penal colonies and the prison mines of eastern Siberia are equally well suited to the almost boundless tracts west of Hudson's Bay, and northward to the region of the Great Slave Lake. Indeed, I know of no more graphic and truthful portraiture of many parts of what used to be marked on the maps as British North America, and is now more commonly known as the British Northwest, or the Canadian Northwest, than these same narratives; but I am sure no words or pictures can adequately convey to the mind the real impressions which these regions make upon one who lives among and travels over them in long journeys in summer and winter. It is one thing to talk of vastness and solitude and silence, of transparent air

and illimitable sunshine in summer, or of fierce, howling winter tempests shutting down about the lonely traveler as he struggles forward, the only spot of color in the weltering waste of snow, with no friendly shrub or tree or sheltering hill greeting his tired senses, only to find an enforced halting-place where darkness overtakes him, from whose frozen torpor and death no morning may arouse him—it is quite another to have experienced these things in one's own person.

Among the mountains there are grandeur and solitude: mists wreath the lofty summits, and lie along the valleys where the rivers run; morning and evening bathe the snowy, ice-clad peaks in floods of golden and crimson glory; from moment to moment shadows, tints, and tones of color come and go to mark the passing hours; and climb where you will, the prospect is always limited, bounded, varied. Even the barren, unsociable sea is not without changing aspects and motions, fraught indeed, at times with danger and terror; but the traveler who has passed many seasons in the grandest mountain scenery, or has sailed on many a sea, has yet to find, in an acquaintance with the great plains, a new set of novel and strange experiences.

Perhaps the first thing which will impress him will be the absence of what Mr. John Burroughs calls an atmosphere. For the first time in his life he will feel that he is out of doors, or that his eyes have been suddenly opened. Objects which under other circumstances would have tempered and softened outlines, or would be altogether invisible, now seem as sharply defined as the shadows of houses or trees in the glare of the electric light. There is no toning of the light, and between the blades of grass on the ridge of some slope many rods away from him, he sees with utmost distinctness to unimaginable distances. The sky rises like a wall about him, and through the limitless air the sun shines like a resplendent disk of burnished metal. Upward, if he look long and steadfastly, he will lose the illusion of blueness, and will seem to be looking into blue-black depths, which will convey to his mind with a new meaning the notion of space. The distant forests, where they exist, and the low, tumbled hills, grassy and rounded to their summits, are seen without disguise or softening; and moving animals or trains of carts show every detail

with the distinctness of close proximity. Perchance a herd of white-tailed deer, of antelope, or possibly of elk, challenges him to a feat of arms, and he is chagrined to find that he has underrated the distance of the game, and that his shot has only served to startle his quarry. In the morning he looks out over the landscape far beyond the spot where he will take his mid-day meal, beyond even his next night's camp. As this experience is repeated from day to day with unvarying monotony, his spirits begin to flag, and a depression comes over him that may verge toward hopelessness. If the surface of the country is flat for many miles, as is often the case, this effect is intensified, and the horizon appears to be rising all about him and approaching nearer and nearer to swallow up the sky and overwhelm him. He longs for a tree or the slope of a hill to break the unvarying sameness of level horizon and to suggest to him new vistas. Even clouds and storm are welcome, for they at least bring shadows and changing lights and movement.

I shall never forget the peculiar sensation of being challenged which I experienced when, after a long railway journey from St. Paul, Minnesota, one day in April, some years ago, I arrived at the city of Winnipeg, Manitoba, and, as the clear morning sun rose above the level horizon unbroken by hill or tree, I went out to the edge of the town and looked away over the brown grass, now faintly flushed with the first tender green of early spring. It was easy to imagine that an almost audible voice invited me to penetrate the untraversed regions toward the north and west, and to discover the mysteries of the wilderness where almost unknown rivers ran, where vagrant, unbreathed winds were ever blowing, where wild animals and water-fowl lived unmolested; and it was with impatience that the necessary delay of preparation for a long journey far from civilization, with unknown perils and hardships to be encountered, was endured. This sense of challenge, which is not less an invitation to meet nature at first hand, without the conventionalities and the expedients of long use, is, I presume, one of the peculiar experiences of the pioneer and the explorer in every clime, whether by land or sea; and it must be practically unknown to the dweller in old communities, and not less to the ordinary tourist, to whom the thought of absence from his usual associates and the conveniences of mails and telegraphs and daily papers seems only painful.

We speak of darkness which can be felt. Similarly we may speak of silence which can be heard, and this is another impressive element of an experience of the plains. On the sea, except in calm, and in the forest and among the places of human habitation, there is always

sound, even at night; but on the treeless plains, in the midst of normal activity, there is silence as of the grave. Even a hurricane is comparatively inaudible, for there are no waters to dash, no forests to roar, no surfaces to resound, while the short grasses give forth no perceptible rustle; and there is something awful in the titanic rush of contending natural forces which you can feel, but cannot see or hear. The wind may sweep away your breath on a current of sixty miles an hour, and the clouds may rush through the sky as in a tornado, but no sounds confound the ear. A winter blizzard, which carries on its frigid breath destruction to life, which blinds the eyes, and which drives the particles of ice and snow with cutting force against the frozen cheek and through all but the heaviest fur clothing, is comparatively inaudible, and the traveler appears to himself to struggle vainly with an implacable, ghostly force which fills the whole creation. When, also, nature is undisturbed in tranquil summer mood, and the sky is blue and flecked with fleecy clouds floating far aloft, all sound seems to have died out of the world, and a mantle of silence enfolds everything. Partaking of the predominant natural sentiment, man becomes silent also; he ceases to talk to his mates and becomes moody and taciturn. The merry song of the voyager, echoing between wooded shores, the shout, the joke of the cheerful traveler here are stilled—stified you might almost say—by the immeasurable muffle of silence. Here are no woods to give back the answering shout, and the crack of the rifle is insignificant. The cry of the passing wild-fowl in the darkness, as you lie awake in your tent at midnight, comes to you with a weird, faint, far-away sound as if heard in a dream, and even the rare thunder breaks impotently on the continent of silence. If a comrade is lost, and you wish to make some sign to direct him to the camp, no noise which you can make with voice or firearms will be of any avail, for such noises will penetrate only a few rods at farthest. By day the only resource is a flag on some elevation or a smoke of burning grass; by night rockets must be sent up as at sea, or, if these have not been provided, fire-brands from the camp-fire may be thrown up with some hope of success. No one can know, until he has experienced it, the longing which takes possession of one who has been for weeks practically separated from speaking men, once more to hear the sounds of common life, the roar of the city streets, the sound of bells, and even the crowing of the cock in the early dawn.

The Red River of the North, as it used to be called on the maps of our boyhood, when Green Bay was an obscure trading-post, and the Mississippi River, except by name, was

familiar to few, rises in the State of Minnesota in the same divide which sends a portion of its waters southward on their long journey to the Gulf of Mexico. By a short portage it is easy to pass from the head-waters of the Mississippi to those of the Red River, whence a continuous passage is open northward through Lake Winnipeg, the Sea or Nelson's River, and Hudson's Bay even to the Arctic Ocean. The river flows westward at first, but, presently turning, it forms the boundary line between Minnesota and Dakota. It drains a broad, level valley, and winds tortuously between clay banks like an irregular canal, fringed with a sparse growth of oak, ash, and box-elder, which nowhere spreads out into a forest. The valley is so broad and flat that only from the appearance of low elevations at a great distance to the east and the west can you correct your impression that the surface is that of an upland plain. Here are great areas of a heavy, fertile soil, which within a few years have become celebrated for the immense crops of wheat grown on them. Flowing away from the sun, the river suffers from disastrous floods, for while the advancing season thaws the snows along its upper course, the lower portions are yet locked in ice. At such times the valley is covered for miles with water to a depth of several feet, and as late as the month of April or May the city of Winnipeg, lying at the junction of the Assiniboin with the Red River, about sixty miles north of the international boundary line, is liable to be overflowed. During a part of the year small steamers navigate the river from a point in Minnesota to Winnipeg, and thence to Lake Winnipeg; but, below the city named, the channel, nowhere deep, is obstructed with shallows and rapids at the few places where the underlying rock approaches the surface; while, nearer the lake, the stream becomes so broad and shallow as to be of small commercial importance. The Assiniboin, rising about 450 miles west of its junction with the Red River, flows through a level or rolling plain to the eastward with many short turns, receiving no important tributaries. At favorable seasons of the year steamboats of small size and light draft can go as far west as Portage la Prairie, a distance of about 70 miles, and occasionally they push their way even up to the Hudson's Bay trading-post of Fort Ellice, about 350 miles from Winnipeg. Here the river lies in a deep valley between precipitous bluffs more than one hundred feet in height. In this portion of its course it affords a striking illustration of the action of streams in working over the materials along their courses. From the bluffs on which the post is situated you look down into the valley where the stream, now only a narrow creek fringed with willows and poplars, winds with

countless turns, swinging in the course of centuries from one side of the flood-plain to the other, obliterating old curves and forming new ones, but never moving in a straight line for a dozen rods, until the whole alluvial deposit has been worked over time and again.

The general aspect of the Great Lone Land of the Canadian Northwest is that of a broad plain lying inclined at a low angle of elevation against the eastern base of the Rocky Mountains, sloping both eastward toward Hudson's Bay and northward toward the Arctic Ocean. There may be said to be no rock-exposures throughout the whole area, and rarely does the surface rise even into low, rounded hills. In two expeditions of nearly a thousand miles each, in a direct line northwest from Winnipeg, my notes, made daily, show that rock *in situ* was seen only once, and that at Stony Mountain, not more than fifty or sixty miles from the city named. Here is an outcrop of bluelimestone of excellent quality for building purposes. It is perhaps fifty feet in height, and it covers an area of not more than a square mile. In a few places on the head-waters of the Red Deer, the Battle, and the two Saskatchewan rivers, a few layers of a yellowish sandstone were observed in the cut banks of the streams adjacent to strata of a poor quality of bituminous coal. The surface of the country is, however, in many places thickly strewn with granite boulders, generally of rounded form, sometimes abounding in the shallow marshes, the surrounding hills being destitute of them; or again, the slopes and the tops of the elevations are covered with them, while none appear in the depressions, the disposition of them appearing to be entirely capricious. For hundreds of miles at a stretch it is possible to go without finding a stone as large as the fist, and, along the beds of the rivers, the fragments of limestone brought down from the mountains in the annual freshets are carefully gathered by the few inhabitants as a source of the lime used for making the mortar with which they daub the spaces between the logs of their poor cabins. There are some hilly tracts, but the highest elevations are less than two hundred feet, and the summits are smoothly rounded and covered with grass, like the more level surfaces below. Occasionally sand-hills are met with, consisting of loose white sand, in which a few stunted poplars find a precarious foothold. The prevailing winds are constantly changing the contours of these hills, and they are at all times, except when covered deep in snow, extremely difficult to traverse with vehicles or animals. Blinding sand-storms frequently occur in their vicinity, against which it is difficult to advance. Shallow marshes and shallow lakes are numerous, the latter often having neither inlet nor outlet, and varying in size from small

ponds to large areas many miles in extent. Not infrequently the traveler discovers well-defined, ancient sea-beaches composed of rounded pebbles and fine sand, generally overlaid by the clay soil of the country, and appearing where the surface has been removed or broken through.

Hudson's Bay, a vast, shallow body of water, an inland sea, constitutes the great drainage-basin of the wide region under consideration. It is 600 by 900 miles in its greatest dimensions, and it is large enough to contain all the other inland waters of the western hemisphere without sensible increase. Into it flow from the west all the waters of a wide region which do not find their way northward to the Arctic Ocean through the Athabasca and the Peace rivers, the chief affluents of the mighty Mackenzie system. The principal channels of these accumulated waters are the Red River already spoken of, the Saskatchewan rivers, and the Churchill, or English, River. The Saskatchewan rivers, known as the North and South Saskatchewan, take their rise in the foot-hills of the Rocky Mountains at a considerable distance asunder, the South Saskatchewan receiving as its principal affluents the Red Deer River and, nearer the mountains, the Bow and the Belly rivers. The Battle River drains the area between the Red Deer River and the two Saskatchewan, and empties into the North Saskatchewan at Battleford, in longitude 108°. The latter stream, flowing in a direction a little north of east in its upper course, presently turns to the eastward; then bending to the southeast, it approaches to within twenty miles of the south branch, parallel to which it flows for some 300 miles, when the two streams unite their waters near Fort à la Corne in longitude 105°, latitude 53°. Receiving the waters of Lake Winnipeg and of the adjacent body of water known by the two names Lake Manitoba and Lake Winnipegosis at their northern extremity, not less than 260 miles from where the Red River discharges into Lake Winnipeg, the direction of the river thenceforth is northeastward, until the mighty flood pours into Hudson's Bay, in longitude 93°, latitude 57°.

Thus this Saskatchewan river-system drains an area extending through a region measured by some twenty-five degrees of longitude and some fifteen degrees of latitude; and some notion of the magnitude of these streams can be obtained from the fact that about midway in the course of the North Saskatchewan, before it unites with the south branch, it is four hundred yards broad, or as broad as the Ohio at Cincinnati, while nearer Lake Winnipeg it becomes much broader still. The Indian name of the two great branches of the system, Saskatchewan, means "swift-flowing," and it is applied to many other streams in the far North-

west. Throughout much of their courses these rivers sweep along with great velocity in broad but comparatively shallow channels, lined in some parts with a scanty growth of cottonwoods and poplars of little commercial value. The soil through which they cut their way is a yellow clay containing great quantities of fine sand. It is easily dissolved by water, and, as a consequence, the streams are always turbid, sand-bars are constantly forming and changing, and quicksands abound. Navigation in these streams is beset with all the difficulties which characterize the Missouri, if not with still greater ones. Yet, during three or four weeks in June and July, a few stern-wheel steamers of light draft leave the city of Winnipeg on the flood-waters, and, making a precarious passage down the Red River, traverse the length of Lake Winnipeg with difficulty, and stem the current of the North Saskatchewan in the hope of reaching the Hudson's Bay Company's trading-post of Edmonton before the waters fall. Occasionally they accomplish their endeavor, and land their cargoes of supplies at the head of navigation at Edmonton, within one hundred miles of the Rocky Mountains, after a tedious voyage of nearly two thousand miles; but more frequently these boats are stranded on the shifting sand-bars, perhaps four or five hundred miles from any settlement, in a totally uninhabited country. Here they must remain until another season in the charge of two or three men, who provide a store of fuel and prepare for a long nine or ten months of absolute isolation and the rigors of an arctic winter; or, when news of the almost expected disaster has reached some settlement by a messenger on foot or on horseback, a brigade of carts is fitted out and despatched to convey the stores by land to the point for which they were shipped, while the steamer winters where she was stranded.

Another feature of this great drainage area is the valleys which in the course of centuries the rivers have cut out for themselves. They are often of great depth, and in places have very steep walls. Arriving at the brink of the valley of the South Saskatchewan at one time in my journeyings, I sent out a guide in one direction, while I went in another, to search for a slope sufficiently gradual to enable us to get the wagons down in safety. After a half-day's search, we agreed upon a place for the undertaking. The valley of the Red Deer River is three hundred feet deep and three miles wide. Aware of its general course and situation, as I approached it with my half-breed guide on a wagon, I was surprised that no sign of it appeared. The rolling surface of the prairie seemed to stretch out to the horizon without a break, and yet, if the maps were only approximately

FRENCH HALF-BREED.

correct, I knew that we could not be more than a mile or two from the edge of the depression. At length, in the treeless expanse in front of us, we observed what appeared to be a single small fir-tree three or four feet in height, standing alone in the plain. Approaching it, we came presently to the edge of the valley, and found that the small fir was only the tip of a great tree standing far down the steep declivity, while still below were whole groups of *Coniferae* whose tops did not reach half-way up to the general level of the country. A brief inspection showed us that no descent was possible for vehicles or animals, and, picketing our horses, we set out to descend, if possible, on foot. After a tortuous and toilsome task we reached the bottom, but we could not discover the stream, although we pressed our way to the opposite valley walls. We concluded that we

must have crossed a dry fork and that the river lay in some depression further on. It was necessary, therefore, to return to our starting-point, and, driving some miles down-stream, to make another attempt. This we did, and at length came to the stream, which was flowing with a moderately rapid current, not yet having lost the impetus derived from the Rocky Mountain slopes, some two hundred miles distant. Its waters still retained some of the characteristics of a mountain stream, being clearer, colder, and less bitter than those of streams nearer their mouths. In the banks of a small tributary of the main stream I discovered several thin layers of a poor quality of bituminous coal. This substance is found in nearly all the river-banks of the country near the mountains, and in places it is of such abundance and quality as to render it of great commercial value; and as the country

is opened up to settlement, and railroads are built to supply the necessary means of transportation, it will become increasingly important. At Edmonton, on the North Saskatchewan, seams of coal of a thickness of five or six feet are known and worked. Coal from these strata is used in the blacksmith's forge with success. Seams of much greater thickness are reported to exist nearer the foot-hills, but until recently the knowledge of them was confined to a few half-breed and Indian traders and hunters.

The soil of the country is mainly a yellow clay of unknown depth, of superior fertility when exposed to the action of sun and frost, but difficult to cultivate. It abounds in alkali, and this fact, together with the cool climate of the latitude, renders it the natural home of the wheat-plant, of which no insect enemies are here known. Grass is found everywhere, in the swamps, on the slopes, and among the hills even to their summits. It is of several varieties and of varied excellence. In the vicinity of the thriving settlement of Prince Albert, not more than one or two hundred miles from the junction of the two great streams already spoken of, on the slopes of a long hill, I remember that as I rode along the heads of the thick, nutritious grasses were on a level with the seats of the wagon upon which we sat. Farther west there are large tracts well suited to cattle-raising, notwithstanding the severity and the length of the winters. A fine grass grows to the height of about twenty inches, and as the season of growth closes, it cures as it stands into a natural hay of great excellence; so that in winter, beneath snow a foot and a half in depth, there is often found a layer of bright, well-cured hay of a lively green color, and eight or ten inches in thickness, every particle of which animals eat with avidity. In other localities a short buffalo-grass mats the surface, and formerly furnished abundant pasturage for countless herds of buffalo, now unfortunately nearly extinct. In marshy regions, besides the customary well-known marsh-grasses, the "goose-grass," more commonly known in this country as the scouring-rush (*Equisetum*, probably *hiemale*), is often found, and, strange to say, it proves to be most fattening to horses. Where it abounds, the native ponies, after a long season's service in a trader's brigade of carts, turned out as valueless and abandoned to die, come out in the spring with sleek coats of hair, every gall-mark gone, and, as the traders say, "rolling fat." In waterless tracts a small patch of "goose-grass" furnishes both food and drink for the animals of an outfit, so that they fare better than the men, who, in the absence of water, can do no cooking, and do not care to eat ungarlished pilot-bread.

In the southern portions of the country, in what may be called the Winnipeg region, there exists the black prairie loam, of considerable depth, so characteristic of the prairie areas of Illinois and Iowa. Farther west and north, about Regina, the present capital of the province, this friable, easily tilled soil changes to a tough brown clay called "gumbo." In summer it becomes nearly as hard as rock, dries and cracks into areas of perhaps a square yard each, between which deep fissures run, of a breadth of two or three inches and a depth of a foot or more. In such a soil the grass is pinched and scanty, and traveling over the surface either on horseback or on wheels is trying to the last degree. A team of not less than four horses is needed for breaking it up, and it turns up in great lumps containing several cubic feet. Fortunately it slacks upon exposure to the air and the frost, and proves to be very fertile and productive. When wet it adheres to vehicles and implements with the utmost tenacity, and in grading railroad embankments on the Canadian Pacific Railway a man with a shovel was assigned to each scraper and each plow to remove the gummy mass. Where the ordinary yellow clay is found, the surface becomes hard in summer, and the grass suffers in times of drought; but wherever the badgers have thrown up the earth about their burrows, the grasses grow rank and tall. Where settlement has been made, wheat is sown in the spring as soon as the snow disappears and an inch of soil is released from the grasp of the frost. It germinates quickly in the clear, hot sunshine and the long, cloudless days of the high northern latitude, and sends its roots downward with the retreating cold, while the upward growth is astonishing. The slowly unlocking ice-crystals furnish a constant supply of moisture and the cool soil so congenial to the plant. In a period of about ninety days the crop matures, and with the most ordinary culture the farmer harvests from forty to fifty bushels of wheat that weighs from sixty-two to sixty-eight pounds to the bushel. Oats, barley, and root-crops grow with equal luxuriance, heads of the first-named often measuring fourteen inches, and potatoes of two or more pounds weight being common. These crops grow freely as far north as the Peace River country, in latitude 60°, but, of course, this whole region is unsuited to the growth of corn, or of the commoner fruits of the temperate zone.

Certain indigenous fruits, however, are abundant and valuable, among which may be mentioned the common strawberry, which in places grows so thickly that the wheels of a cart in passing over the ground are speedily reddened, and the tracks resemble stripes of blood on the grass, while the fruity fragrance fills the air. A fine variety of the black cherry grows in thick-

FROM A PAINTING IN POSSESSION OF H. G. YOUNG, ALBANY.

CONJURING BACK THE BUFFALO.

ets in many places, and supplies large quantities of desirable fruit to the wandering bands of Indians. Another berry which attracted attention, and which, I think, would repay cultivation as an agreeable substitute for the common currant, now nearly ruined by the currant-worm in so many parts of this country, is what is known among the half-breeds and Hudson's Bay employees as the "red berry." It is probably the buffalo-berry of the upper Missouri, *Elaeagnaceæ Shepherdia argentea*. At the elbow of the South Saskatchewan River it is found growing in thickets, as also in many other localities. The shrub sometimes attains a height of fifteen feet, having a black bark, very hard wood, many strong spines, and small, simple leaves. The berries are borne in the axils of the branchlets, and are usually three in number and of the dimensions of a medium-sized pea. They are of a bright scarlet color, though a yellow variety is sometimes found, and in flavor they resemble the common red currant of the gardens. The hardness of this fruit, its fine acid taste, and its freedom from insect enemies render it probably a desirable addition to our list of known fruits. But the most esteemed wild berry of the region is that which is called by the poetical name "Saskatoon." It is the *Amelanchier Canadensis* of the botanists, known by various common names, as the shad-berry, the June-berry, and the service-berry. It is gathered in large quantities, and one of its principal uses is in making berry pemmican, than which there is no more delectable food to an Indian or a Hudson's Bay man.

Of the forests of the northwest plains little can be said. From Lake Winnipeg on the east to the foot-hills of the Rocky Mountains on the west, and from below the international boundary to the far northern regions inhabited by the "Huskies," or Eskimos, no forests of large area and commercial value are to be found. Indeed, the scarcity of trees and water constitutes the most surprising and prominent characteristic of this wide region. For more than two weeks at a time one may travel constantly and not find so much as a twig or a shrub of any kind. Even the willow is not found, and nothing but grass and sky meet the view in any direction. I have crossed great rivers, skirted considerable lakes, and traversed hilly tracts for hundreds of miles at a stretch, and have had to depend for cooking purposes upon an oil-stove, which I had taken the precaution to carry with me. In the absence of such provision, the only resource is to carry a few dry poplar poles upon one of the carts, to be used with such economy as only a half-breed or an Indian knows for cooking his scanty food and for boiling tea. Even the "buffalo-chips" have disappeared since the

practical extinction of the buffalo, and to go without fire for days together is no unusual experience. When water also is not to be had, as often happens in traveling on these plains, the plight of the traveler is by no means enviable. And sometimes when water is abundant enough in lakes and ponds all about, it is not drinkable, and no boiling or other means of purification will render it serviceable. Of the loveliest color, as blue as the sky, lakes by the score may be counted from a single standpoint, let into the surrounding hills at various elevations like steps of lapis lazuli, without connection, inlet, or outlet; but so bitter are the waters that no animal, either horse or man, would drink of them. In them and around them, within the reach of the alkaline waters when blown by the wind, no vegetation is found, and on them no wild fowl alights. As camping-time approaches, near nightfall, in traveling over these plains, it is a necessary preliminary to send out a guide to taste the water of some pond near which it is proposed to make camp. Throwing himself prone upon the ground, he takes a quantity into his mouth, and then usually ejects it with a shake of the head and the emphatic utterance of the single word "Bad." Since, however, the waters of a tract may be of quite different characters, it is usual to find among the bitter lakes one or more whose waters may be drunk with passable satisfaction.

One day in summer, on leaving a river, misled by the appearance of the country before us, we took no water with us, arguing from the appearance of a distant forest on our line of advance that water must be discoverable. When we reached the belt of poplar woods, the sun was about setting, and we made all haste, leaving the carts still loaded, to find some creek or pond before the long, lingering twilight of the north should turn to darkness. Not a drop of water could be found in any direction, and we were forced to make camp in a hollow where the goose-grass afforded sustenance for our horses. Without water no cooking could be done, and a fire was unnecessary. Thirsty as well as weary, we lay down to sleep. In the early dawn, my half-breed guide declared that in a certain direction, at the distance of a mile or two, a body of water could be found. During the night he had heard wild geese flying over, and from their cries as they alighted he was informed of the existence of water not far away as certainly as if he had seen it. We broke camp, and, moving in the direction designated, within an hour came to a lake the waters of which, although not sweet, were drinkable. Here we took breakfast.

About Lake Winnipeg, and also on the head-

A HALF-BREED SETTLEMENT.

ENGRAVED BY R. C. COLLINS.

waters of the rivers near the mountains, are found some considerable forests of spruce; but the trees are not large or tall, and the lumber they are capable of affording is of no great value or amount. The oak is not found above latitude 50°, or, say, one hundred miles north of the southern boundary-line, and even further south than that line it is mostly of the variety known as the bur-oak, and it is dwarfed and valueless. Along the streams the box-elder (*Negundo aceroides*) is sometimes seen, but it rarely exceeds a thickness of six inches and a height of thirty feet. With the exception of a few specimens of the ash, it is practically the only hard wood known. The characteristic wood of the country is the aspen (*Populus tremuloides*), the most widely dispersed deciduous tree of the northern parts of the continent of which I have any knowledge. From below the latitude of Washington as far north as I have ever been, where other varieties of deciduous trees diminish and disappear, the aspen poplar maintains its existence, and I have found it growing in sheltered depressions along the hills far up toward latitude 60°, hundreds of miles north of any other deciduous forest-tree. Probably the aspen and the willow are the two forms of deciduous forest vegetation which endure successfully the widest variety of climatic conditions. Were it not for the prairie fires which sweep over the plains in autumn and spring, it is probable that in a few years vast tracts now covered only with grass would become aspen forests, and the present conditions of the coun-

try would be considerably changed as to aridity, exposure to extreme cold, and vegetable products. Considerable forests of this wood have been ravaged by the fires, and the trees yet stand branchless, dry, and rotting in the wind. In other parts the woodland is still green and vigorous, and is liable to flourish for many years longer, unless it too encounters the usual fate. As a proof of the tendency toward forest development seen in these regions, it is enough to say that the traveler finds now and then considerable plantations of aspens of one, two, or three years' growth, which have already been swept by the fires, like their more mature companions; while again a forest of seedlings has just set out upon a precarious existence. When dry, the wood of this tree is light, stiff, and sufficiently hard for most uses, although not very tough. Of it the half-breed and the Hudson's Bay hunter or trapper build their rude cabins, the logs rarely exceeding eight or ten inches in diameter. These houses are generally small, perhaps sixteen or eighteen feet square, and rarely more than six feet high at the corners. Each consists of a single room, which serves for all the purposes of family life, having one low, battened door turning on wooden hinges. It is roofed with alternate layers of prairie-grass and mud to the thickness of half a foot or more, resting on a layer of the poplar poles placed close together. A single small window, generally unglazed, serves the usual purposes of such an opening. The floor is of puncheons of the same wood as the rest of the

house, or is simply the clay tramped hard and smooth. The chimney and fireplace are made of mud molded upon a rude structure of sticks to give it form and stability. The fireplace, unlike the openings in the chimneys of our own backwoods, are not low and wide, but narrow and tall, perhaps one foot and a half by four feet in dimensions; and in them the half-breed sets up the billets of fuel on end, having cut them in the half-breed fashion. His ax is of light weight, and is always used in one hand as an American uses a hatchet, the other hand being employed in supporting the slender log he is chopping. Instead of notching the logs which make the walls of his

"IRON COLLAR,"  
BLACKFOOT.

abode upon one another at the corners, as is customary in the new parts of this country, the dweller in the Northwest squares large posts for the corners and for the sides of the door, and in these makes longitudinal channels two or three inches wide and deep to receive corresponding flat tenons wrought on the ends of the logs. The cracks and openings between the logs are stopped with clay, and thus after a few days' work, with an ax as his only implement, he constructs a house which makes up for all its deficiencies, from an architectural point of view, by its inexpensiveness and its comfort in a hyperborean climate. Like other primitive structures of man, it seems to have been suggested to the builder by the abodes of birds and animals in nature, like the dugout of Dakota; and I could never come upon a cluster of these cabins without observing their resemblance to the nests of the mud-wasps.

The so-called forts of the Hudson's Bay Company are in reality nothing more than trading-posts, and little reliance could ever have been placed on the strength and solidity of their construction against determined hostile attacks, even from Indians. A palisade of split logs of poplar twelve or fifteen feet high, sometimes with blockhouses at the corners somewhat higher than the palisade itself, sometimes without, incloses an area in which are placed the log structures used as storehouses, blacksmith-shops, and other necessary offices, together with the residence of the factor, or chief trader. Naturally these are of better construction and more commodious than the single houses of the few settlers outside the stockade, and they are generally two low stories in height; but all are made of logs of the poplar. The blockhouses are pierced for rifles, and command the approaches to the stout gates by

which on trading days—never Sundays—the motley crowd of Indians, half-breeds, and renegade white trappers and hunters are allowed to enter with their packs of furs. At Edmonton, through openings in the blockhouses, there peer down in grim silence what appear to be mounted cannon of small caliber and ancient construction, but their moral effect alone is relied upon, for they too, like the rest of the structures, are of wood only.

By preference, and from lack of other timber, of this same poplar the half-breed of the northwestern plains constructs his cart—the characteristic vehicle for all purposes in summer, and his sledge or jumper for winter use. With his ax, an auger, and his buffalo-knife for tools, in a short time he builds a light, stout cart singularly well adapted to his circumstances. As ordinarily constructed, it contains, like the harness with which it is attached to the draft-animal, not a particle of iron. The wheels are well framed together, and are about five feet in diameter. The spokes are well driven into the nave, the pieces of the felly are doweled together, and the structure dishes after the most approved fashion. The pony or the bullock which is to supply the motive power is harnessed between two large, light shafts, and upon the axle of the cart a light framework is built to contain the packages which are to form the load. It is lined and floored with thin boards wrought out of trees with the ax, or, more recently, the whip-saw. On such a cart a load of eight hundred pounds can be carried with safety, and its strength is such that repairs are rarely necessary. When a break does occur a ready resource is found in the bundle of "shaganappy," or strips of tanned buffalo-hide, which the native traveler always carries with him. Applied wet and flexible by wrapping around the broken shaft, felly, or axle, it soon dries in the wind of the plains and hardens like bone, and no second fracture can occur at the mended place. The harness also, made of the same tanned hide, can easily be mended with the same material. It is an amusing sight to observe the method of effecting such repairs. By some sudden wrenching occasioned by a deep rut, a long-used shaft is splintered, and must be mended. The strip of hide is softened in water, and two men wrap it closely about the broken part. Bracing their feet, they draw the bandage with all the strength of their hands and the muscles of their backs until you would say it could be drawn no more; but the process is not yet completed to the satisfaction of the dusky workmen. They now take the free ends in their teeth, and, using their hands as additional braces, they pull backward with such a strain as only iron jaws and steel teeth can withstand. The ends are now

A BLACKFOOT INDIAN.

ENGRAVED BY E. HEINEMANN.

secured by intricate knots, and the repairs are completed.

When the half-breed comes to a river to be crossed, however swollen and wide, he finds it scarcely an obstruction. A buffalo-hide, or, in recent times, since the buffalo has disappeared, a canvas cart-cover, placed beneath one of the wheels, its edges brought up over the rim, furnishes him a "bull-boat," seated upon the center of which he paddles himself across and guides his swimming pony. In succeeding journeys he ferries over his load and tows his remaining cart-frame. The wagon of the white man, however skeleton-like and light it may be, is incomparably less well adapted to the necessities of plains travel than this primitive construction, which practically can neither break nor sink, and which re-

quires no blacksmith or skilled wheelwright for its repairing. It is at the same time wagon and boat, and in case of necessity it serves as excellent fuel. Commonly, the hunters' and the traders' trains are made up of from twenty to seventy, or even more, of these vehicles moving in a single varying line over the rolling plain, each animal, except the first, attached to the cart in front. Covered usually with canvas covers, more or less white, they constitute a picturesque feature in the landscape when seen at a distance against the green of the grass, or against the sky as they creep over the summit of some slope—the only moving objects, except the clouds, within the reach of vision, arousing in the lonely spectator suggestions of human life and commerce and far-off civilization. No grease or other lubricant

is ever applied to the axles, since the Indian considers such a use of fatty substances a sheer waste of food, and the lugubrious creaking and wailing of the thirsty wood locates such an outfit even before it can be seen and after it disappears. A specimen of the Red River cart can be seen in the National Museum at Washington, but it has been repaired by the civilized device of iron nails, and so is not quite typical.

A characteristic feature of the great plains of Canada are the trails which connect the widely separated trading-posts and settlements, along which supplies are brought in and the peltries, which constituted in former times the chief products of the country, were carried to the great fur-depots on their way to Montreal, whence they were shipped to England. Formerly, before the construction of the St. Paul, Minneapolis, and Manitoba Railroad, access to these remote northern districts was by means of traders' carts from St. Paul over the unsettled prairies of Minnesota, and by small steamers on the Red River to Fort Garry, the site of the present city of Winnipeg, a journey of several weeks' duration. Earlier still the dog-trains, now a mode of conveyance known only to the past, except in the extreme arctic regions of this continent, brought down in the winter season sledge-loads of valuable furs, and only half-breeds and Indians made the journey. As late as 1869, the present president of the railroad named above, then a poor soldier of fortune living in St. Paul, was met one stormy day in winter alone with a dog-sledge pushing his way far north in Minnesota toward Fort Garry. Rumors had reached him of that movement of the half-breeds near the fort which took place upon the adoption of the articles of Canadian confederation in the year named, and which became known as Riel's rebellion, and he was on his way to see what openings for his adventurous and enterprising spirit might arise in a time of political disturbance. Earlier yet in the history of the country, before St. Paul had become a distributing center for the great areas north and west of it, before the Mississippi River had been approached by railroads, the principal highway by which the Northwest Territories were penetrated was a water-route now altogether abandoned, although many men still live who traversed it from time to time in the old days. Some of the Hudson's Bay trading-posts were established two hundred years ago at favorable points on the streams and lakes of the country, and supplies were brought to them annually, and furs were carried from them, by ships sent from England to Hudson's Bay. Arriving at

the bay after tedious and dangerous passages through the ice of Hudson's Straits, not far from the southern end of Greenland, they navigated the stormy, shallow waters and arrived in June or July at Fort Churchill or Port Nelson, where, lightening their cargoes, they received their return freight and hastily set sail for home, fearful lest the ice of winter should make them prisoners for an entire season before they could reach the open Atlantic. At the ports of debarkation, crews of men who had brought down the furs in York<sup>1</sup> boats from the distant posts were waiting to load the precious supplies and the annual mails for the return trip to the wilds. They rowed and pushed their heavy crafts up the broad, rushing streams and across the lakes, day after day through the uninhabited wilderness, until, after months in some cases, they reached Lower Fort Garry and Upper Fort Garry on the Red River; Fort Ellice and Fort Qu'Appelle on the Assiniboin; Fort á la Corne, Carlton House, Fort Pitt, and Fort Edmonton on the North Saskatchewan; and other posts on the English, or Churchill, River, and on the countless lakes for whose accumulated waters it furnishes a channel. By other routes from the bay, and by combined water and land journeys, they carried such necessary supplies as would bear transportation to posts on Great Slave Lake, on the Peace River, on the Athabasca, even to the far trading forts on the Mackenzie River, up to and beyond the arctic circle.

The freighters' passage left no traces in the fleeting waters, but on land there still exist many of the old trails winding mile after mile over the grassy plains. Some of them are now abandoned, the primitive commerce having taken new directions, yet in this arid climate decade after decade they remain just as the last wheel pressed them. The passage of such a train of carts as I have described leaves three tracks in the dry soil, which, deepened by following trains, become more and more distinct. One is made by the pony or the bullock which draws the load, the others by the wheels. At length hollows or chuck-holes are formed, and, to avoid them, a new series of tracks is made a few inches apart from the old one. This in turn is abandoned for another, and the process goes on until as many as a score of such sets of tracks are worn in the brown soil, each track a foot in width and nearly a foot in depth. They everywhere maintain their parallelism, never running into one another, and the appearance they present is that of brown bands of color winding through the green expanse. Often not another sign of human life or occupancy can be seen for hundreds of miles, and an infrequent passenger with his outfit hails the advance of another with all the interest with which, on long

<sup>1</sup> The York boat is made at Fort York in the Hudson's Bay Territory. Constructed of whip-sawed boards, it is large, strong, and of great carrying capacity.

voyages in unaccustomed waters, one ship hails another on the homeward course. The travelers halt when they meet, cordial greetings are exchanged, the news of the distant points of departure is asked for, each party waits while the other prepares such letters as he may wish to send back to far-away friends, and with good

of mosquitos in the Northwest is a myth. It is a question of definitions, of course, but the learned writer could not have used the word "myth" in an ordinary signification. At least I used to think at times when the mosquitos were so abundant that we could not eat our soup at supper-time, even with the defense

PONIES HERDING AROUND SMUDGE FIRES.

ENGRAVED BY C. A. POWELL.

wishes they go on their separate journeys, and solitude unbroken reigns again.

The great plains are now comparatively devoid of animal life, and at certain seasons, even in summer, one may travel for several days at a time without seeing insect, bird, or beast of any kind. This surprising statement is literally true: but at other times insect life abounds beyond all comprehension or experience elsewhere; and now and then herds of antelope, or deer of several varieties, or a few elk, or a bear, or a band of wolves, or a badger may be seen; while the air is full of the winnowing of the wings and the cries of wild fowl. On every hand are seen lakes white with swans, plover, herons, cranes, curlew; and the active and enterprising cow-bird, which, alighting on the backs of domestic animals where there are any, promotes their comfort and satisfies its own hunger by the onslaught it makes on the myriads of mosquitos which torment them. Principal Grant at one time made a hurried journey through a part of this country, and upon his return wrote a book in which he averred that the existence

of a most powerful smudge of grass and leaves placed to windward, without finding every spoonful plentifully peppered with the culex, and a single sweep of the hand would capture a score of the winged pests, while the bitter tears ran from our eyes, that Principal Grant's powers of observation might have been considerably improved by exposure without protection for a time to such an atmosphere. Alas! during July and August mosquitos do abound, and they are attended by coadjutors of no mean powers—sand-flies, black-flies, deer-flies, bulldog-flies (the bot-fly), and I know not how many others, who conspire to make life for man and the animals on warm, damp days and at night nothing less than a burden. So numerous and virulent are they that animals grow thin in flesh during the period of their existence, and on the Athabasca River horses and cattle perish outright from their attacks. At night the traveler's animals are often stampeded by them, and the usual precaution taken is to make a dense, dank smudge of green boughs and sods, in the acrid smoke of which a passable degree of comfort

can be had. From such a smoke it would be impossible to stampede a band of horses, and for the choicest positions in it they will fight with teeth and hoofs.

But the most impressive signs of the abundance of nobler animal life in recent times are the countless buffalo-trails found almost everywhere. Like the cart-trails they are worn deep into the soil, and they remain unchanged for years. While feeding or resting, the buffalo are scattered about, and they make no permanent impression of their presence; but when they are going to water or are traveling to new pastures, they move in single file behind the leader of the herd, and a trail is speedily formed by their sharp hoofs. On their now deserted pasturing-grounds these trails cut the surface in every direction, now and then marked by the wallowing-places worn deep in the ground, where each animal followed the leader not only in marching, but in taking a dry wash for health and comfort. Up-hill and down-hill these paths wind and wind. Even on the thin edges of the hogbacks in the valley of the Red Deer River, and on their almost vertical faces, where no horse can find a footing, and a man would find difficulty in going, the buffalo found an easy road for his sure-footed majesty.

It is not long since this noble animal was the monarch of these lonely regions. Not only are the hill-slopes in many places terraced by their deep-worn paths, running parallel to one another at the distance of perhaps a yard, but in favorite localities, where they once fed in countless droves, their bones and horns lie scattered on every hand, bleaching and slowly decomposing in the drying wind. Sometimes every square rod of the surface presents the sad memorials of a noble animal gone to his death in a pile of shoulder-blades, rib-bones, leg-bones, horns still covered with the black, shining corneous substance which made them so striking during life, and in a broad skull with empty eye-sockets, still tufted with brown hair, and still maintaining a lordly port. At one time in my wanderings I came, near the Eyebrow Hills, to a tract some hundreds of miles in extent, already — early in the autumn as it was — scathed by the prairie fires and left black and charred, the only spots excepted being a few small round marshes in which the

moisture had checked the sweeping flames, where we found the only available pasturage for our animals at night. The coal-black surface was thickly dotted with the white bones of the buffalo, which, in some merciless onslaught of the hunters, had fallen there by the thousand for the paltry booty of their hides. Just where they fell, they lay scattered over miles of country, their bones the only mementos of once happy, crowding, noble animal life. As the skeletons gleamed white in the darkness and silence of night, the impression made on the thoughtful observer was depressing enough.<sup>1</sup>

Desiring one day to look over the country at large, with my half-breed guide I crossed some clay cañons on horseback, and climbed the slopes of one of the hills spoken of, whence in all directions the undulating plain lay spread out below me. A locating engineer with his party was following on my trail at a distance of some weeks' travel, and with him I wished to communicate concerning the best direction in which to carry his line. As my party consisted of only two men besides myself, I could not detach a messenger, and my only resource was to erect some monument on the summit of the hill, which, seen against the sky, would attract his attention. For such a construction the numerous buffalo-bones lying about offered ample materials. Inscribing a message to Douglass, the engineer, on a broad, white shoulder-blade, I put it at the base of the monument, and collecting a score of great skulls with the horns still attached to them, I piled them together to the height of eight or ten feet. At the top I placed another blade-bone directing attention to the message deposited below. As we rode away in the slanting light of the setting sun, which threw the shadow of the hill and its melancholy cairn of bones for miles and miles across the plain toward the east, whence we had come, I thought of the appropriate nature of such a monument — the monarch of the lonely plains, crowded to his death by the ruthless, fiery edge of advancing civilization, sullenly looking with sightless eyes afar to catch the first gleaming light and the thunderous rush of that highest embodiment of nineteenth-century progress and power, the railway locomotive.

Until the farmer came to look upon these broad areas as furnishing land for cultivation in

<sup>1</sup> Some notion of the former abundance of the buffalo in the Canadian Northwest may be obtained from the following memoranda of outfit for a single buffalo-hunt in 1840, the authenticity of which cannot be doubted. There were required: 200 carts and harness, 655 cart-horses, 586 draft-oxen, 403 horses for running buffalo with saddles and bridles, 1240 scalping-knives for cutting up meat, 740 guns (flint-lock), 150 gallons of powder, 1300 pounds of balls, 6240 gun-flints, and the number of persons was 1630. The expedition returned to Fort Garry in August, and the Hudson's Bay Com-

pany paid £1200, or \$6000, for the booty brought in. How many animals were slain we can only conjecture. Less than twenty years ago, my intelligent half-breed guide told me, he had seen, more than once, piles more than six feet in height of buffalo tongues which had been thrown together just as they were cut out after a single successful hunt by a party of Indians. These tongues were the perquisite of the medicine-man, who, during the progress of the hunt, sat in his tepee beating his drum and uttering incantations for its successful outcome, instead of participating more actively in the slaughter.

crops and for the raising of cattle, there was little to attract men, civilized or uncivilized, to make their homes here. Nature was forbidding, and offered few natural products for the subsistence of human beings; fuel was scarce and poor, water was of the meanest description, and a climate of the utmost rigor prevailed. The presence of fur-bearing animals in great abundance in former times, now sadly lessened, alone held out inducement to wandering tribes of Indians, who could clothe themselves from the fruits of the chase and feed their hungry bodies with the carcasses of the slain. More than two hundred years ago the early French voyageurs, traversing Lake Superior and penetrating among the tribes of Indians on the upper Mississippi, pushed their adventurous journeys northward also, and learned of the beaver, the buffalo, the otter, the fox, the sable, and other valuable fur-bearing animals existing in great numbers in a hitherto unexplored region. The Hudson's Bay Trading Company, one of the most remarkable commercial organizations of all history, entered and took possession of a waste of which as yet civilized men had no need. For two centuries, with their few European retainers and the dependent aborigines who gathered about them engaged in hunting and trapping, they held almost unchallenged possession of a territory nearly as large as the entire United States. A teeming population with settled homes and busy towns and cities was no part of their desire, and they took measures to exclude all except such servitors and dependents as could assist in gathering the annual stores of peltries and in transporting them to Montreal. When a few years ago this company was forced by the necessities of the times to dispose of its proprietary rights to the Canadian Dominion, the paucity of both human and animal life throughout these regions became apparent. The animals had been hunted and trapped, destroyed by powder and by poison until their skins no longer furnished a source of profitable trade, and the Indian tribes had largely perished by starvation and disease. The few remnants of once noble tribes were taken in hand by a paternal government and were gathered upon farms and reservations, deprived of the possibility of getting intoxicating liquor, and controlled by an efficient mounted police force, the like of which is not known on this side of the boundary line. Thus it is that the traveler of to-day in these lonely regions may journey for weeks at a time without encountering a single human being outside his own party; or finding a sign of former or present human occupancy, while the only tokens of the former abundance of animal life are those which betoken its extinction.

John Remington.

A MEMBER OF THE MOUNTED POLICE.

The early grass of spring is bright green in hue, like the springing wheat of the farmer; but as the season advances the prevailing tint is a sage-green, which forms an admirable background for the display of the colors of the flowers. The flora is abundant and varied, and of the usual character of the semi-arid regions, but the hues and tints of color in blossom and leaf and stem are of remarkable depth, purity, and intensity. The common orange-lily lifts its chalice of blood like that drawn fresh from living veins. The primroses flaunt their white and yellow in splendid magnificence, and the cactus blossoms flame against the gray-green surface. In favorable localities curious cyripediums, and the spiranthes, and other members of the orchis family, attract admiring attention. But the roses far surpass all other flowers; they nod and blush in perfect abandon over miles and miles of waste, to gladden the eye of the infrequent traveler.

## ITALIAN OLD MASTERS.

PAUL VERONESE.—1528—1588.

(PAOLO CAGLIARI.)

AUL VERONESE, the greatest of the decorative painters of the sixteenth century, judged as decorator simply, was born at Verona when Titian was in his prime, and the true art of color

had been developed to its highest attainment, while the sister-arts of sculpture and architecture had been carried to a luxuriance which already had begun to stifle the Renaissance, and to produce forms rather artificial than artistic, but which at the same time gave an opportunity for decoration such as the world had not seen since the Roman emperors. Veronese, as he is generally called in our day, was of a family of artists, his father being a sculptor and his uncle a painter. He began as a pupil of the former, but found the art of the latter more to his taste; and his father, impressed, no doubt, by his success in imitating the work of his uncle Badile, put him under the direction of Giovanni Carotto of Verona. Before he was twenty years old he had become an artist of note and recognized promise, and he found in the Cardinal Ercole di Gonzaga his first protector, and his first considerable commissions were executed for Mantua. But enthusiasm for the arts in the grand-ducal family was no longer what it had been in the days of Mantegna. Veronese burned to spread his conceptions over surfaces of a vastness which was not accorded to him in Mantua, and he returned to Verona and undertook the decoration of the villa of the Porti family near Vicenza. Here he had full liberty in choice and treatment of his subjects, and he covered the walls with scenes from mythology and classic history conceived in the pure spirit of the life of his day, in which Venetian gentlemen and ladies with all the picturesque paraphernalia of the most brilliant epoch of Italian history hobnobbed with the gods of Olympus and the worthies of old Rome.

From Vicenza he went to Treviso, then a portion of the Venetian state, where he decorated the Villa Emi at Tanzolo, near by; and here again he filled his space with visions of a resuscitated past masquerading in the garb of Venice. But the City of the Doges was the goal of all artistic ambition of the day, and in 1555 he went there with letters of recommendation to a compatriot, Bernardo Torloni, Prior

of the Convent of St. Sebastian, who obtained for him from his brotherhood the commission to decorate the sacristy with the "Crowning of the Virgin" and four other subjects, a commission which he fulfilled with such brilliant success that he received a further order for the church of the convent, where he painted the history of Esther. The moment was most favorable for his entry into the capital of the arts. Tintoretto was absorbed in his great undertaking at the School of St. Rochus; and Titian, the supreme authority in matters of art in Venice, who was now growing old, became at once the friend and protector of the newcomer. In 1563 Titian was the foremost to support the claims of Veronese to the award of the decorations of the Library of St. Mark, in the competition which was invited by the Council, and in which his protégé gained one of his greatest triumphs. This is the date of the production of the "Marriage Feast at Cana," now in the Louvre. The details of the history of this, which is regarded as the greatest of his pictures, are interesting, as giving us at once an idea of the power of the painter and the value of art at the day of its production. The contract for it was signed on June 6, 1562, and the picture was delivered on September 8, 1563. The canvas and colors were found for him, the convent provided for his subsistence, and promised him a pipe of wine as a bonus, and he was to be paid 324 ducats, the ducat being of the value of three francs. When the difference in the value of the precious metals is estimated, the sum was equivalent to about \$1500 to-day.

By this time the reputation of the painter had reached France and Spain, and Louis XIV. made propositions for the purchase of one of his pictures. Upon the "Supper with Simon" the lot fell to be the subject of contention between France and Spain. The picture belonged to the Convent of the Servants of the Madonna, who were willing to sell it; but the Council interfered, and purchased the picture, which they presented to the king of France, for the law of the time forbade the exportation of works of art, which the state regarded as important to the dignity of Venice.

In 1565 Veronese went to Rome; but with all due consideration for the critics who find in his later work the influence of Michelangelo,

VENICE ENTHRONED, BY VERONESE.

IN THE ACADEMY, VENICE.

I cannot see that the art of the southern schools affected that of Veronese more than it had that of Titian. He remained as faithful an interpreter of his surroundings as he had been before the journey, and no factitious ideal of a time gone by ever came in to disturb his vision of the things that constituted his actual world. This is shown by his being called in 1573 before the Inquisition to respond for blasphemy in one of his pictures, a "Last Supper" painted for the Friars of St. John and St. Paul, in which he had introduced the customs of his time. A French writer, M. Armand Basquet, in his researches in the archives of Venice, discovered the report of this curious trial. In it the painter is being questioned by the inquisitor:

Q. "What is the signification of the figure of one whose nose is bleeding."

A. "It is a servant who has met with an accident which set his nose to bleeding."

Q. "What is the meaning of these people armed and dressed in the German manner, holding halberds in their hands?" The painter replies that he works according to the fashion of painters and fools, and had found no other way to express the fact that the master of the house was rich and lived splendidly, and must have had servants who might have been thus occupied.

Q. "But there is a buffoon with a parrot on his wrist; what is he doing?" And so he is questioned as to all the personages of his drama.

He replies finally: "I believe, to tell the truth, that at that Supper there were only Christ and the Apostles; but when in a picture there is a space left, I fill it with figures of my invention."

Q. "But does it seem decent to you, in the Last Supper of our Lord, to represent buffoons, drunken Germans, dwarfs, and other stupidities? Do you not know that in Germany, and in other countries infested by heresies, it is customary in their pictures, full of foolish things, to caricature and ridicule the holy things of the Church, so as to teach false doctrines to ignorant people?"

Veronese calls to his aid the example of Michelangelo, who in his "Last Judgment" had painted Christ and most of the judged naked.

But the inquisitor asks if he was of the opinion that that was proper and decent. Veronese replies:

"My very illustrious lords, I had not taken such matters into consideration. I was far from imagining such irregularities. I paint with such study as is natural to me, and as my mind can comprehend." He was, however, obliged to paint out his buffoons and dwarfs and similar heresies, and we have in the Academy of Venice the picture as the Inquisition willed it to be.

In 1577 the fire that destroyed the works of Bellini, Carpaccio, and Titian made a place for the pencil of Veronese. The Senate nominated a commission to which was given the charge of finding the means to repair the disaster. The artist gave himself no concern in the matter, but kept at work in his studio while his competitors canvassed the commission. Contarini reproached him with his indifference to the opportunity, and he replied that he was more concerned about the execution of his works than to get commissions. His confidence in his merit was perhaps more the cause of his tranquillity, though the demand for his pictures must have made him really indifferent to the reception of new orders. He was, however, in spite of his indifference, commissioned to paint the ceiling of the council-chamber, on which he did the "Triumph of Venice"; and he executed for the republic the great pictures of the campaigns of Mocenigo and Loredano, the "Return of Contarini from the victory at Chioggia"; the "Emperor Frederic at the feet of Pope Alexander III."; and others among his noblest works. From this time to the date of his death he was occupied with commissions from all the princes and notables of Europe, as well as from the rich cities of the Venetian state, which were all competitors for his work. His life was without incident in its unbroken triumph. In the year 1588, while taking part in a procession to celebrate the jubilee of Sixtus V., he caught a cold and fever, from which he died in a few hours. He was buried in the midst of his works in St. Sebastian, where his tomb is marked by a stone beneath a portrait-bust.

THE EMBARKATION OF COLUMBUS AT PALOS.

# CHRISTOPHER COLUMBUS.

BY EMILIO CASTELAR.

## IV. THE GREAT VOYAGE.

IN that memorable twelfth of May, Columbus set out from Granada for Cordova, and thence by way of Seville and Huelva to Moguer and Palos, where there awaited him the caravels so ardently desired for the

realization of the dreams that to his quickened faith had long seemed actualities. Columbus tarried a few days in Cordova to bid farewell to his dear ones, and to make provision for his sons. The high-born family to whom he was joined by such singular ties, although not wealthy, aided materially in carrying out his plans, and an Arana, a near kinsman of Beatrice, was the devoted companion of Columbus in this first venture. These domestic matters being settled, the discoverer went to Palos, there to devote himself to the arduous task of making ready for the expedition. Money, the first requisite of every practical undertaking, was at hand. Resources had been procured by divers ways and means. By royal warrant a forced levy of three caravels belonging to local pilots was laid upon the town of Palos, to be taken for an unspecified use and an indefinite time.

Toward the end of May the town council published its formal acceptance of the orders, yet by the end of June urgent summons had become necessary, and sharp reprimands for non-compliance with the imperative orders from the palace. This important municipal assistance was supplemented by a grant of 1,140,000 maravedís by the crown of Castile, to which Columbus added 500,000 more as his personal share of one eighth, collected by him with great difficulty from diverse sources. But, even with the money at command, something else was lacking. Those called upon to assist the enterprise, and to accompany the discoverer, mulishly endeavored to escape the onerous duty. Furthermore, as a punishment for their failure to serve the crown, the equipment and costly provisioning of the caravels were imposed upon them, a measure which bore grievously on that needy maritime population. The general sentiment rebelled against the garrulous and flighty adventurer, who wearied them with his Italian volubility, and his fantastic schemes born of a disordered imagination.

The order to provide stores for a whole year struck terror to the bravest souls, whose most daring ocean ventures had rarely carried them more than two hundred leagues from land. In vain the sovereigns sent letter after letter; in vain the alcaldes time and again proclaimed the imperative mandate to the blare of trumpets and the roll of drums; in vain the royal pursuivant, Juan de Peñalosa, compelled the unwilling pilots to embark by force; in vain the mission of the corregidor, Juan de Cepeda, who had forthwith manned the fortifications so as to enforce obedience if need were—the sailors fled like souls borne of demons upon the winds, and, after making the sign of the cross to ward off the wizard spells of the Genoese charlatan, became invisible as though by enchantment.

With the high and inflexible resolve belonging to his character, as we now know it, Columbus so strenuously persisted in launching forth at any hazard and with any possible crew, that he promised, as authentic records show, to throw open the jails and to take the pardoned convicts as sailors, even at the risk of their mutinying, as though his expedition were not glorious, but suicidal. These heroic resolves were at this juncture looked upon as the vagaries of a monomaniac, and exposed him to the danger of being bound and confined in some asylum on the first violent symptoms. Owing to these vulgar distrusts, the opposition of those around him grew in proportion as Columbus redoubled his efforts. Neither the commutation decreed in favor of a number of malefactors who were willing to ship on the caravels, nor other extreme and impossible measures of like violent import, gave results favorable to the expedition, and our pilot ran serious risk of being shipwrecked on the very shores of his desire, and of losing the hoardings of the thirty years and more during which his life and soul had been utterly given to the colossal scheme of his voyage, now well nigh frustrated by the incredible and unforeseen repugnance of the masses at the very time when its success seemed assured by the concessions won from the throne by such herculean efforts. This fresh rebuff completely unhinged the nervous system of Columbus, and brought on attacks of vertigo. With the royal patronage heaped upon his head, with his hardly amassed gold in his scrip, and with the municipal au-

thorities at his feet, his scheme was being baffled and ruined by the resistance of the people.

Fortunately for Columbus, the providential character of his undertaking was on his side, and so also was Juan Perez, the Franciscan, who, as he had previously aided him to meet the objections of the court, now helped him anew to overcome the popular prejudice. Columbus had sought his assistance on three occasions of moral shipwreck,—more dire than those of ocean,—and had thrice found a haven in the affection and wisdom of the friar, whose knowledge of the common people was as great as his knowledge of royalty. As he had successfully besought the throne for needed means, so now he won the popular support, and prevented the royal aid from becoming fruitless through the failure of the townsfolk to give their humble, but perhaps more indispensable, coöperation. His prime motive was his friendship for Columbus, which in fervor equaled that displayed later by so ardent and zealous a man as Padre Las Casas, friendships, both of them, bordering on adoration, and in their material and intellectual aspects bequeathed to after ages. But, apart from this noble personal devotion, Padre Juan was actuated by his love for cosmographic science, born of the sea and fostered by his intercourse with the mariners, as well as by his love for Christianity, so soon to be diffused throughout the far-off lands of which the discoverer discoursed in the cloisters of the convent. Juan Perez, less ignorant of the world than the folk of Moguer and Palos supposed, determined to put himself at the head of the scheme, with both hands and both feet, as we vulgarly say; and thus he won over the Pinzons, as being men especially fitted to rally the much-needed but reluctant sailors, who still persisted in doubting the empty speeches and baseless schemes of an unknown adventurer. Thus comes upon the scene Martin Alonso Pinzon, the illustrious partner in the marvelous enterprise.

The first result of this intervention was the employment of persuasion in place of force; the second, to facilitate the shipment of the crews; the third, a feeling of unanimous confidence in the feasibility of the undertaking, and assurance of a happy outcome. Garci-Fernandez pledged his cosmographic experience on the truth of the scheme; Juan Perez, like a true Franciscan, based his exhortations on its moral and religious aspects: but by far the most influential, because of his being a skilled seaman, was Martin Alonso Pinzon; for with his deep-rooted convictions, his native courage, and his large personal outlays, he assured the practical accomplishment of all that Columbus had planned and his advocates had avouched. Pinzon was an old sailor; a ship-

owner, not only by inclination, but by inheritance. When he took the affair in hand the whole aspect of the situation changed. The timid regained courage, the doubters began to feel hopeful reassurance, the idle bestirred themselves, the lukewarm displayed interest, and the skeptics faith; the deserted strand swarmed with sailors, the calkers' mallets rang on the hulls, the carpenters patched the worn planking, a goodly store of provisions was stowed on board, the riggers stretched cordage and canvas on the bare masts, and there was no longer need of impressed galley-slaves or felons to equip so virtuous and scientific an expedition. At the outset, Columbus would have been content with ninety men, but more than six score were won over by his tireless coadjutor. The discoverer's resources proved scanty, through his having underestimated his requirements, and because of the heavy outlay demanded for the equipment; but his far-sighted lieutenant added half a million maravedís to the million and more already given by the Catholic Sovereigns. At that time the population of Palos comprised barely 2000 souls, yet the town furnished three pilots, besides the nucleus of the crew. These sailors of Palos, a lesser number from the neighboring village of Moguer, recruits from Niebla, Huelva, Ayamonte, and some other hamlets, with a few adventurers, made up the crew, which, despite the unusual and perilous character of the voyage, was not after all very heterogeneous.

The drafted caravels did not, in Pinzon's eyes, amount to much. Preferring vessels of small size, because better fitted for shallow coasts and for entering river mouths, the prudent ship-owner discarded the unseaworthy ones, and gave from his own shipyards all that was necessary and useful. He fitted out the *Niña*, built and owned by his younger brother. The *Gallega*, which was larger and more suitable for the flag-ship, besides being the only decked caravel and a strong and stanch ship, he rechristened *Santa Maria*, and assigned to the admiral. The third, which, according to some, was one of the drafted vessels, while others deem it the property of Pinzon himself or of the two brothers, was named the *Pinta*. The village seemed transformed. The road to Moguer was thronged, and so was the way to La Rábida. Many went and came in search of Columbus, who remained at the convent as a guest, but more came and went in search of the Pinzons, who lived in Palos and had relatives in all the neighboring hamlets. Pinzon raised 500,000 maravedís to add to the fund already collected; he provided the expedition with the needful equipment and the provisions requisite for so long a cruise; he

gathered the crew by persuasion and bribes; yet no business papers or receipts changed hands, nor was there any written contract regarding his share of the profits, everything being left to the good faith and proved integrity of both parties. Some writers explain this fact by suggesting that the Pinzons, being men of large knowledge and experience, possessed some certain information on which the plans of the discoverer were based. On duly considering what we know of the active life of Pinzon, notwithstanding his own negligence and the silence of his comrades, all more occupied in doing deeds than in recording them, the conviction grows that he must have made good use of his many opportunities of observation. His cruises in the Mediterranean; his stay in ports and cities where to the traffic in merchandise is joined the interchange of ideas; his watchful study of the twofold teachings of the revealing stars and the shining track of his ships; his observant nature and his investigative mind—all so far raised him above his contemporaries that he was able to comprehend Columbus and follow him, without losing sight of the incentives and rivalries inherent in frail human nature. In one page of his life-story may perchance be found the secret of his action and the grounds of his foresight—in his journey to Rome in quest of facts on which to base fresh expeditions suggested by the example of the Portuguese, and by his own experiences in voyages to Guinea and the Canaries.

Pinzon was intimate with a certain librarian of Innocent VIII, whose name history does not record, and this learned man showed him a map on which lands were vaguely depicted, lying beyond the Fortunate Isles, and to the westward. This may be true or false,—there is no certain authority for the statement,—but it is found in many books, and springs from the splendor of the pontifical court in that age. An inconspicuous figure is this Pope Innocent. Eclipsed between the marvelous artistic achievements of his fortunate predecessor Sixtus IV., who gave his name to immortal monuments, and the enigmatic Alexander VI., whose ambition soared so high and led him so far, he shines only by the fact that his family name is associated with the preliminaries of the Columbian discovery in the inscription on his tomb in the Vatican, which perhaps may atone for weaknesses almost inexcusable, and gain for him the pardon of posterity. But these Italian journeyings of Pinzon, his sojourns in Rome, then glowing with ideas and inspirations, his visits to the Vatican Library, and his acquaintance with the unknown librarian, if they do not prove the existence of that as yet undiscovered map, at least bear witness to the countless treasures of cosmographic learning in the court of

the Vatican, well fitted to arouse in this glorious coadjutor of Columbus the zeal which he displayed in assisting the preparations for the projected voyage, and to train the keen insight that discerned afar its sure success.

On August 2, 1492, everything was ready, and the crew were notified to embark, to await the uncertain moment when a favorable wind should permit the little fleet to set sail. Nothing so befitted that solemn hour as a votive procession from the caravels to the monastery, to which the eyes of the mariners turned as to a spiritual beacon, brighter than any that flared along the headlands. This pious duty performed, the crew returned on board the caravels, where they patiently awaited the order to sail, while Columbus retired to the monastery eagerly to watch for a favoring wind. When the dawn should break, he hoped to be able to sail during that day, August 3, since, being Friday, it was of good omen, despite old Italian superstitions to the contrary; for upon a Friday the first crusade under Godfrey of Bouillon had taken Jerusalem, and on a Friday, too, the last crusade under the Catholic Sovereigns had won Granada. Not only were these famous precedents auspicious to his purpose, but it so chanced that they were then in the midst of the pious festival held by the Franciscans during the three opening days of August, sacred to the Virgin of the Angels, the patroness of their seraphic order.

Columbus kept all sail on his caravels during the night of August 2. The old salts of the crew looked for a favoring wind at starting, and Columbus's eager watchfulness was not to pass unrewarded. From the height on which La Rábida stood, he scanned sea and sky with steadfast gaze, like one of those sea-birds, presagers of changes of wind and weather, clinging to the scarred and storm-beaten cliff. About three in the morning, while the stars yet twinkled in the skies and all earth slumbered, the awaited breeze sprang up, bringing new life to the discoverer's veins and quickening the throbbing of his heart. The pines murmured as though hymning the dawn, and the waters rippled as though heaving with the breath of love and hope. Columbus awakened Padre Juan, and he in turn the child Diego, and the three repaired to the chapel in quest of heavenly aid and religious solace for the approaching pangs of separation and for the fateful voyage. As in the boundless ether shine the stars, so the lamps flickered in the little church, lighting with their rays alike the courses of the ocean and the pathways of the soul. The monk put on his priestly vestments, and celebrated the holy sacrament at the high altar, before the taper-lighted Virgin. The hour was come, and Columbus resolutely descended to

the shore, plucking himself away from embraces that held him to the land like some deep-rooted oak, for the sail-wings were ready to bear him to the realm of sea and sky. He soon reached the wharf, and as the dawn broke in the east the flag-ship majestically ran inshore to take the new Argonaut on board. The fluttering sails, the hurried manœuvres of the crew, the boat-swain's whistle, and the cries of the sailors as the ships got under way, announced a speedy departure, and attracted the early risen villagers to the shore in their natural desire to witness the scene, and to bid farewell to departing friends and loved ones. When Columbus sprang from the skiff on board the caravel, and the anchors were weighed, a shudder ran alike through

authorities, the name of caravel was generically given in Columbus's time to any vessel of burden, whatever its size and strength. "A long and narrow single-decked vessel, with a beak at the prow," says our dictionary of Castilian authorities, to which we turn as to an oracle in the matter of national idioms. This definition, in truth, cannot be bettered in its first part, if able nautical treatises are to be trusted. But when that classical dictionary adds that a caravel has three masts of nearly equal size, with three large lateen yards and sails, some emendation seems needful; for though the three ships of Columbus were called caravels, only one of them carried the kind of sail thus described, and that was the smallest and the frailest of them,

DRAWN BY D. B. KEELER.

ANCIENT CARAVELS.

FROM AN OLD PRINT.

the departing sailors and the leave-takers on the strand. Where they were going they knew, but as their westward course after leaving Cadiz and the Canaries was to take them far beyond those lately won islands, none knew whither they were bound or the duration of the voyage. The cross floated above the flag-ship, which bore seaward toward the unknown, seeking mysteries perchance impenetrable and inaccessible to the human mind and unconquerable by human will.

As we have elsewhere said, the caravel was better fitted for the task of discovery than any other bark of that day. Stout and big enough to withstand the shock of waves, it was at the same time sufficiently light and shallow of draft to enter the mouths of rivers and to tack with ease in narrow channels. According to nautical

the *Niña*. Our dictionary is also in conflict with the classic texts of seamanship when it asserts caravels to be dangerous because of their shallow draft, being easily capsized unless their sails were quickly trimmed, when unimpeachable masters of maritime science and experience declare them to have been stanch and stout enough for the needs of those times. The Columbian caravels were at most of eighty tons burden, and had a square poop surmounted by a high castle, to match the smaller castle at the bow. Squaresails were sometimes carried, but caravels were generally lateen-rigged. Nevertheless, the definition of one versed in those matters makes the caravels of larger size than is commonly supposed, and describes them as stanch and fleet, with high castles at stem and

stern, with three vertical masts and a bowsprit, the foremast and mainmast being square-rigged and the mizzenmast carrying a lateen sail. Some assert that they could make but 28 leagues in a day's run, others as high as 72 leagues. With my own eyes I have seen in the Columbian Library at Seville the caravels of Columbus admirably portrayed. The discoverer himself has sketched them faithfully, with the steady hand long trained by his trade of map-drawing. They are found traced in the first decade of Angleria's treatise, which is preserved as one of the priceless books of Ferdinand, the second son of Columbus. The disproportion of size between the ships at once strikes the eye, and therewithal the very great diversity of rig. The *Santa Maria* has the advantage of her consorts in build and size. Her rigging appeared more complicated than the others. Square-sails were on the fore and mainmasts, a lateen yard on the mizzen. The contrast in the height of the prow and the poop was startling. The *Pinta* was shown in the sketch as a sort of compromise between the *Santa Maria* and the *Niña*, but sparred and tackled more like the former. The *Niña* looked very like the modern fishing- and trading-luggers, while her lateen sails recalled those nimble skiffs, so common in the waters of the Mediterranean, whose white sails, bathed in the rays of the southern sun, show gaily between blue sea and bluer sky like gulls skimming over the softly rippling surface. Each of the vessels was manned in accordance with its capacity and importance. In the flagship the admiral was accompanied by a mate, Juan Cosa, a native of the Cantabrian sierras, deep-tanned by the unresting Biscayan sea; a physician of Moguer, Maestre Alonso, well versed in all the experience permitted by the primitive means of observation in his day; a chief alguacil of Cordova; a purveyor of the royal household; a page; a scrivener; a convertite Jew as interpreter; and a *veedor*, or inspector, so called because appointed in towns and cities to enforce the building regulations. Thus, in the second book of the Royal Ordinances, *veedor* is used in the sense of overseer, for it is there declared to be the king's will to depute each year as many discreet men as might be needed as *veedores* to inspect the provinces. The *Pinta* carried a large crew, most of them natives of Palos, with a few from Moguer. The character of the various crews denoted that the *Santa Maria* bore the command, while the *Pinta* carried the greatest possible number of expert seamen. The little *Niña* was also manned by able sailors like those whom Martin Alonso Pinzon had gathered about him in the *Pinta*. Besides the skilled mariners, she carried a surgeon, a silversmith, an Irish guide, and also another of English birth, with several

workmen and farm-laborers from the inland provinces, Estremadura, Andalusia, La Mancha, and even Old Castile.

THE windings of the shore soon hid the fleet from the sight of the villagers, but Fray Perez and his companions watched it for three hours longer, until it sank beneath the distant horizon. During the first few days' run, these barks, laden with bright promises for the future, were sighted by other ships, laden with the hatreds and rancors of the past; for it chanced that one of the last vessels transporting into exile the Jews expelled from Spain by the religious intolerance of which the recently created and odious Tribunal of the Faith was the embodiment passed by the little fleet bound in search of another world, where creation should be new-born, a haven be afforded to the quickening principle of human liberty, and a temple be reared to the God of enfranchised and redeemed consciences. As though the sun were not to shine for all, as though the will of heaven had not made us equal, the accursed spirit of reaction was wreaking one of its stupendous and futile crimes in that very hour when the genius of liberty was searching the waves for the land that must needs arise to offer an unstained abode for the ideals of progress. Following their narrow views, the powers of the middle ages denied even light and warmth to the Jews, at the same time that they revealed a new creation for a new order of society that was predestined by Providence to put an end to all intolerance, and to dedicate an infinite continent to modern democracy.

Columbus bent his course toward Cadiz, and thence to the Canaries. The prow of the flagship being resolutely headed to the west, he descended to the cabin and began his journal. A religious soul, he wrote at the head of such a transcendent record the sacred name of Christ. The divine protection being thus invoked upon his task, he associated the work he had begun with such as had gone before, and, as though he had the power to perceive by intuition how mankind would link the conquest of Granada with the discovery of America, he recorded how he had beheld the cross brought from Toledo shining upon the Vela tower, and had seen the Moorish kings driven from their conquered Eden-city and doing homage to the Christian sovereigns who in that supreme hour wrought the unity of Spain. I recall not now who it is that speaks of the opening pages of that journal as pompous and inflated because of these reminiscences, but surely there is no more potent incentive to grand enterprises in the future than the example of great achievements in the past. The invocation of Catholicism and of the sovereign fitly marks the whole

discovery, for these two great unities were the necessary nucleus about which to garner the innumerable harvest of new lands amid the waves, and the bright constellations of new beliefs in the human soul. He notes how the sovereigns had granted him the style of Don, with the titles of Admiral and Viceroy, to descend to his heirs and successors forever.

The journal serves not alone to disclose the motives of his undertaking; it also exhibits its course day by day. The first three days at sea were favorable. Having set sail on Friday, by the following Sunday they had run some fifty Castilian leagues. But on the fourth day the *Pinta* was imperiled by a defect in her steering-gear, and although the admiral ran up within speaking distance, he could not assist her, fearing a collision, for the wind and the waves were rising. The two owners of the vessel had designedly weakened the rudder, in order to disable her, and to prevent her from going on and being lost, as they deemed the other caravels must surely be, in the storms of the Shadowy Sea. Columbus confided the repairs to his skilful captain, who took temporary command of her. The injury called for workmanship superior to any at command in the watery wastes, and so there was no recourse but to head for the Canaries. They sighted the nearest of the group, Lanzarote, and went on to the Grand Canary, whence they were constrained to go to Gomera, only to return again to the Grand Canary. The first idea of Columbus was to fit out another caravel, in view of the unseaworthiness of the *Pinta*, but none could be found at Gomera. He was obliged to fit a new rudder to the *Pinta*, and to supply the *Niña* with square-sails in place of her lateen rig, before they were enabled to proceed. Their departure was indeed urgent, for a most untoward mishap was to be feared in the expected arrival in the outlying islands of the group of a fleet fitted out by the king of Portugal, and despatched to the furthest limits of the sea then known for the purpose of preventing the passage of Columbus. Yet, despite the tireless activity of the discoverer in hastening the work, the repairs and the procurement of provisions occupied a whole month.

At last, on September 16, the explorers turned their backs upon the known seas and launched forth into the unknown. The *Pinta* led the way, closely followed by the *Santa Maria* flying the standard of command, and lastly came the *Niña*. The little fleet seemed a living poem, and the obstacles now past, like those hurled against the heroes of olden epics by adverse gods, became mere symbols of the evil inherent in our nature and spreading as a subtle venom through all creation.

There is a lack of agreement as to the part the Genoese pilot and the mariner of Palos

respectively played toward the discovery of the New World. Columbus excelled his helpmate in the abstract sciences, in intuitive imagination, and in inspiration, but Pinzon assuredly excelled Columbus in experience, in shrewdness, in administrative ability, in aptness to command, in power of discipline and organization, in everything executive, effective, and practical. Pinzon was a skilful financier in controlling the expenses of the little fleet, a good administrator in equipping the ships, a consummate commander in enrolling and disciplining the crew; but he was in no wise a revealer, such as Columbus is proclaimed to have been by the voice of all peoples and all ages. When we see Pinzon assembling the crews after the royal deputies and alcaldes had failed; equipping the fleet in but fifteen days when Columbus and his agents had not been able to do so in three months; supplying from his own purse the deficiency in the royal contribution; navigating the dangerously damaged *Pinta* from Cadiz to the Canaries; and when later we are to behold him rising to greater achievements than all these, bringing resolute decision to the accomplishment of his purposes, we may truly say, without detracting from the splendid height to which Columbus rose, that there is still a place in the epic of this titanic exploration for the grand figure of the pilot and shipbuilder of Palos, who not only rendered the departure of the expedition possible, but who, the voyage once begun, was perhaps the most resolute and powerful of will in preventing its failure.

Early in September they left the Canaries behind, and plunged into the abyss of ocean. It was growing urgent that Columbus should do this, for in the eyes of his companions the most ordinary phenomena became celestial warnings. In the clear, half-Andalusian, half-tropical nights of the Canaries rose the deep-furrowed violet cone of the volcano of Teneriffe, in crimson eruption, like a new sun springing into birth, shooting its iris-tinted flames through clouds of smoky ashes, with torrents of stony fragments like falling meteors or glowing like an incandescent milky way — all this filled them with dread, for they deemed the flaring mountain some vast Cyclops, imprisoned there by the divine hand at the uttermost portals of the known earth, to bar the pathway to the unknown world. Columbus showed them the error of their superstition, and how the self-same phenomena were repeated on the familiar shores of Etruria, Italy, Sicily, and Greece. But although their dread was speedily tranquilized by his marvelous eloquence, any unforeseen and fortuitous occurrence threatened to revive their fears and to wreck the plan through uncontrollable panic. At length a favoring easterly breeze sprang up, and the ships sped arrow-

like on their course. The land soon sank from view, and the explorers found themselves alone with sea and sky.

As the astute Genoese well divined the dread which the ever-increasing distance was certain to arouse, he kept two log-books, one for himself and the other for the crew. In the former he recorded the actual run, in the latter a lesser distance; by which device he diminished the fears and restrained the impatience of his susceptible shipmates. But in doing this an unforeseen complication arose. Their sure guide, the compass, that ever had pointed fixedly to the north, began to waver. Although this phenomenon had been known for two centuries,—though many say it had never been observed until then,—the crew gave themselves up for lost, and imagined that for them even the one fixed point was shifting, as though God had cast them off. Columbus recognized the necessity of explaining this phenomenon as he had explained the volcanoes. But the explanation was not easy, for while the volcanoes were like others already known, it was impossible to understand or explain the variation of the needle by any familiar fact or experience.

It seems strange that these pilots of Palos and Genoa should have been ignorant of a fact like the variation of the compass, touching which, as some assert, there then existed dissertations in the library of the Vatican, that storehouse of astronomical and nautical treatises indispensable to one who, like the pontiff, aspired through his religious power and universal authority to dominate all the earth. But this deviation, which is noticed in each latitude until it becomes an oscillation at the equator and is reversed in the southern hemisphere, may possibly have been observed before that time, although it remained without plausible explanation; and so it remains, even in our day, one of those occult mysteries which surround the countless facts recorded in the tables of intellectual progress. Sailors call this inexplicable deviation of the needle "nor'-nor'-westing." Columbus accounted for it partly by the shifting of the polar star, partly by the center of attraction not being in that star, but in some other opaque body near the pole, and by countless other specious reasons evolved from his fecund fancy. The crew, however, remained incredulous, unsatisfied by the persuasive words of the discoverer. In the southern temperament nervous impatience predominates. A northerner generalizes less than a southerner. We Spaniards cannot see a thing begun without instantly deducing all its consequences, nor hear a thing planned without fancying it already done. To such plastic imaginations fancies appear as solid realities.

The admiral's earnest attention was now

given to signs of land, which to his anxious mind seemed to be so near. On the spur of the moment, when Pinzon, who was best able to comprehend him, came within hailing distance, he would converse with him through the speaking-trumpet, or exhibit imaginative charts, drawn by himself, on which appeared the island of Cipango, set in those very latitudes through his erroneous conception of ocean's limits. At times in some insignificant object he would discern a trace of the vanished Atlantis of Plato merged in the watery abysses. Soon after quitting the Canaries, a broken mast floated by, which to the malcontents seemed an omen of the punishment reserved for their temerity, the proof of some terrible wreck suffered by others who had dared to clutch at old ocean's secrets, and to violate the mystery wherewith the inscrutable will of Providence had shrouded the sea. Passing patches of sea-wrack served to confirm a statement in Aristotle's "Natural History" touching the abundance of tunny-fish beyond the Fortunate Isles. Any stray bird was a prophecy. Columbus was especially encouraged by the small size and frailness of those he saw, for they could live only on land, near human habitations or among cultivated fields where they could find proper food. With singular acumen he remarked that these birds did not appear to be exhausted, and consequently could not have flown far from these inhabited spots. Whales, too, afforded him like encouragement. Several of these cetaceans suddenly appeared, spouting high as they basked on the gentle swell; and he at once reverted to his pilot's experience and knowledge of natural history, declaring that such creatures never ventured far from the coast, because they love the land. On one occasion, espying a crab clinging to a broken bough, he carefully netted and guarded it as a positive sign that fluvial waters must be near. When all else failed, he dipped up water from the vessel's wake, and, tasting it, compared it to water he had tasted in other times and places, estimating from its greater or less saltness the amount of admixed fresh water from neighboring mountains or plains. A pelican plunged him into a fever of hope. These birds resemble swans, but are of heavier build, with plumage of pearly whiteness, long and flexible necks, serrated beaks, and webbed feet. Being equally adapted to live on shore or on water, they stow the sea-caught fish in their capacious pouches, and carry them to the land, there to devour them at leisure among the trees. All around them was bright; the calm sea smelt as sweet as the Guadalquivir overhung by arching orange-bloom; the trade-wind fanned their brows and refreshed their frames; shoals of leaping dolphins played beside the hulls; and flocks of land-birds followed the sails aloft, while the

splendors of the day widened the circle of the sky in an incomparable and infinite transparency.

The very loveliness and calm, while buoying up the hopes of Columbus, disheartened the doubting crew still more, for they deemed the sea brightened with treacherous gleams to wile them, siren-like, before destroying them. The unchanged direction of the wind, now favorable for their continued advance, but an invincible obstacle to their return; the variation of the needle, as though the very north were abandoning them to chance; the distance sailed without sighting land; the endless and changeless horizons, and the environment of naught but sea and sky, seemed to them like the surroundings of some other planet, devoid of any firm and solid element; and hence sprang the belief, befitting their mental capacity, that life in this ambient medium of air and water belonged to birds or fishes, not to man. How strange, then, that their ships should straightway encounter excessively solid obstacles! On reaching a certain spot, great masses of vegetation filled the ocean, some resembling the mosses of the crags and others purely aquatic, stretched and interwoven in knotty tangle, forming vast labyrinths of densely matted foliage floating at hazard. Growths like the land plant we call starwort, rootless and stemless for better floating, laden with scarlet berries like the mountain mastic, spread over the sea, making it a pathless prairie, as though by magic art its fluidity had been turned to wondrously thick and solid vegetation. To sailors already filled with distrust, forced unwillingly upon this voyage, far out upon a boundless sea, and driven before an unchanging wind, weary of fruitless watching for some other sign of life than the birds and fishes that came only to disappear again, that thick tapestry about their ships must in truth have seemed a snare spread by demons to entangle them, and to hold them forever in its treacherous meshes. Their discontent found vent in those ominous murmurings that forebode some terrible outbreak of fury. When they struck this obstacle their sails for eleven days had been bellied by the unchanging wind. Although the sounding-lead had often pierced the waters no bottom had been found, even at the depth of more than two hundred fathoms. What with the steadiness of the wind, the failure to strike soundings, and the density of the sargasso, there was ample cause for the old dread to waken anew, and for the timid to shrink back.

Familiar with the current fables of maritime disaster, they dreaded lest they might meet the fate of San Amaro, caught in the clutches of the ice-pack, and perishing in his floating prison, when he daringly invaded the frozen ocean, less terrible than the Shadowy Sea. In

the primitive state of knowledge at that time it was hard to make them understand such phenomena. Geology was not yet even imagined. Beyond the record of Genesis, and the scholastic commentaries thereon; beyond the narrow teachings of the erudite *literati*, the naturalistic poem of "Lucrece," the writings of Hesiod, and Ovid's "Metamorphoses," none had searched the fountainhead of things, still less divined the endless chain of cause and effect which gives birth to systematic existences in logical and eternal evolution. Had you told them that the work of creation is still going on, and shown them that vegetative rock, having power to generate other infusorial plants to turn likewise to stone in the lapse of time, and with their madreporic cells build up islands and archipelagoes and continents, they would have called you mad, and visited your incurable insanity with mockery or blows. Europe was once joined to Africa where the Strait of Gibraltar now interposes, as Africa, until yesterday, was joined to Asia by the Isthmus of Suez, pierced under our own eyes. The chain of island groups stretching westward to the New World is doubtless a series of signal-stations whose summits point out the Atlantean land preserved in poesy though vanished in reality, even as those tangled forests of giant vegetation, half terrestrial, half aquatic, so appalling to these first explorers, typify the universality of life, ascending from the lower vegetative organism to the higher animal existence in unbroken sequence. But on encountering this unexpected phenomenon, wherein they beheld only an unfathomable mystery, the men murmured exceedingly, while Columbus remained calm and unmoved. At length they passed through the herbaceous sea, and left it far behind. But the dread of the sailors, more or less real, abated not, for as the waves had long slumbered beneath their leafy screen, so now the winds slumbered in a portentous calm. The miserable men watched their dwindling store of food in dread of starvation, and the lessening stock of water with fears of thirst. But their greatest terror lay in the prolonged calm, and in the prospect of drifting indefinitely upon the infinite deep, to waste and fall and perish. No agony so sharp as that which heralds hopeless death by hunger and thirst. The apprehension of such tortures drove them frantic. The recollection of so many shipwrecked men, clinging to a frail plank on ocean's expanse, gnawing their own flesh and sucking their own veins in their delirium, begat in them such a dread of these unspeakable torments that in their overwrought state they seemed actually to endure them. It stood to reason that any long-continued delay in sighting land must so work upon their fears as to make them turn back. No man among them had ever be-

fore ventured two hundred leagues from the coast, and these wretched sailors had already come eight hundred leagues. The two affections we call nostalgia and abhorrence of the sea spread among the crew like a pestilence, each taking the contagion from his comrade, until not one was exempt. In their floating prison feelings of enmity arose among them, while all shared in hatred of the admiral who had led them into such dire straits. With wrathful eyes and curse-laden lips they became openly rebellious. No outward influence was there to calm their minds. They who had hailed with gladness the first circling birds beheld them now with indifference. Not even when the wind changed were their apprehensions allayed. Although Columbus welcomed any breeze, however contrary, because it showed the possibility of progress in some direction, to them the wind seemed too fierce when it bore them away from their loved Andalusia, and too weak to cheer them when it blew toward home. While the dead calm palsied all progress, they writhed like men possessed; and when it rippled the face of the waters, they fancied themselves driven by blind hazard toward the abyss, and suffered the agonies of the stake and the searing brand.

"They were right who called this Genoese a madman," muttered the sailors. Instead of being himself bound, he, with a madman's cunning, had bound his opponents to his own sad fate. Inspired by greed alone, he looked for power and riches impossible of attainment to a man of his mean talents and lack of capability. Only a foreign outcast, like the admiral, could thus lightly sacrifice valuable Spanish lives to the vain schemes bred in his maggoty brain. The sovereigns had distrusted him; but their courtiers, more vainglorious than sapient, had misled them, and induced them in their goodness of heart to encourage this scatter-brained lunatic. It would be a good thing to lay hold on him and throw him overboard, to make his reckoning with the sharks that hovered anear the caravels in instinctive anticipation of their approaching feast. There was no such thing as land in all that Shadowy Sea; its fancied allurements were but leading them on to be swallowed up in the deep. They had sailed many weary leagues, run long courses day by day, traversed endless spaces with steadfast prow; yet had found naught but watery wastes in that barren expanse, as void of islands and continents as the heavingsolitude of the Noachian deluge. There is nothing so epidemic as fear, naught so contagious. These things grew as they were repeated from lip to lip. By his own conduct Columbus fed the doubts he had sown. He slept not, and sleeplessness is a sure sign of madness. He took no food—a proof of hal-

lucination, they cried. He was solitary amid scenes where companionship is craved; he prayed for hours like a recluse, which showed his uselessness as a pilot. He was proud of having taken the minor orders of the church, as forestalling a bodily death by dying unto men; like a magician he traced mysticsymbols among his papers; he foretold strange events like a soothsayer; from the commonest occurrences he drew the wildest conclusions, like some wizard divining the fortunes of life by palmistry; and he predicted good luck that came not, like a gipsy fortune-teller.

In consequence of all this, the murmurs became threats presaging mutiny. Columbus met this feeling among his crew with the disdain befitting his inner conviction of a fortunate outcome to the voyage. When the crew remonstrated, he answered them patiently; when they thronged to listen, he fascinated them by the flow of his eloquence. After he had overcome their dread of the eruptions of Teyde by telling them of Etna and Vesuvius; their dismay at the variation of the needle by his hypothesis of the shifting of the constellations in whose midst the north star shone; their fear of the sea-tangle by announcing it to be a certain sign of land; their terror when the trade-wind blew unchangingly by predictions of a contrary breeze when they should reach other latitudes; their affright when meteors fell as from aerial volcanoes by theories borrowed from his cosmographic knowledge; their timorousness of the heavy ground-swell, when scarce a breath of air stirred, by half-prophetic conjectures of currents deep in the bowels of the ocean; meeting their apprehensions with facts drawn from his own experience, or by brilliant sallies of imagination, or the incisive utterances of his keen Italian wit, and calculations more or less exact based on his knowledge of mathematics—having done all this, he would become, as it were, transfigured by the ardor of inward faith, offering to them, now voluptuous paradises like Mohammed, now golden cities like Marco Polo; now happy eclogues like Virgil, now fortunate eras like the Cumæan Sibyl; now the spreading of God's holy name among far-off peoples like David or Isaiah, now divine raptures like St. Francis of Assisi; now schemes to win back the Holy Sepulcher like Godfrey of Bouillon, being himself at once cosmographer, mathematician, clairvoyant, prophet, and trader.

But when he withdrew from their sight, when his words were unremembered, they congregated in the forecabin and fell into their old ways, venturing to propose schemes of return; for they had gone further than ever man had gone, and had found abundant proof that in these latitudes there was naught but endless sea and sky. Punctilious, like all good Spaniards;

timorous, after the wont of sailors; loquacious, like all good Andalusians, the real motive which, after all, defeated their schemes of turning back was what we call "black shame," the dread of being called cowards, an epithet inapplicable to such men as they, who for two months had sailed the Shadowy Sea, defying the fury of the universe, and tempting even the divine wrath by their unparalleled audacity. The established fact is that they held a meeting for the purpose of protesting, and positively, though perhaps not very respectfully, demanded that the ships be turned eastward and homeward.

In these incidents many writers have found material enough for dramas and romances of the most thrilling interest, wherein they picture an active mutiny, ending with a melodramatic appeal by Columbus for three days more of grace, after which, if the Indies were not encountered, the deceiver was to surrender at discretion to the rebels, who had already sworn to quarter his body and to cast it to the fishes. This done, they were to turn back to Spain, where they were assured of a triumphal welcome for so just a punishment of this artful cozen. The story remained in vogue a long time, and the public repeated it. Those most familiar with this interesting period of our story have feared to deprive it of a dramatic element by taking away this picture. But in all conscience we must say that, while our scrupulous investigations as a historian confirm the grumbings and discontent, there was no mutiny, if we are to credit the testimony of eye-witnesses written and avouched at the time. There was much murmuring against the admiral, and even a demand that he should turn back, but no insults or insubordination, much less revolt or disorder.

Yet the opposition to Columbus's purposes and course, even if not disrespectful and riotous, must have been formidable since the admiral found himself forced to call a council, and to seek its advice touching the continuance of the voyage. Pedro Bilbao, a Biscayan, one of the crew of the admiral's caravel, relates that he had often heard that some of the sailors wanted to turn back but were dissuaded by the admiral, who promised them rewards. Garcia Alonso of Palos heard the men say among themselves that they were lost, whereupon the admiral answered that he would soon give them "land ho!" In the judicial proceedings in which many of the shipmates of Columbus testified, only one told of a mutinous rising, but from hearsay merely, for he did not take part in this first voyage. After long study of this incident, I agree with the account of the scene given by the erudite investigator Fernandez Duro, in his essay touching the relations between Pinzon and the admiral in setting on foot the first ex-

ploration of the Shadowy Sea, and effecting the discovery of America. The whole narrative of the academic historian rests on the sincere and trustworthy testimony of the pilot Hernan Perez Mateos, given in his retirement at Santo Domingo, when the events were fresh in his memory, and when he, an aged man, soon to appear before the Divine Judge, realized the punishment of falsehood in the other world and its dishonor in this. In fact, the crew of the flagship wanted to turn back, and persisted clamorously in their petition. There are some who would belittle the blindness of those men by the ingenious assertion that they demanded to return, not to Spain, but to the imagined islands left on each hand by the discoverer's pertinacity in steering due westward, unlike Pinzon, who made frequent lateral excursions because his ship was swifter than the admiral's caravel, which, however, he kept in sight. Indeed, the lieutenant advocated bearing a little to the southward in that weary search for the west, but without going beyond mere advice. The sailors of the *Santa Maria* were probably less deferential than Pinzon when the admiral hurriedly called the council, if we accept the judicial investigation, where the facts of such a complex story as this of the first voyage are so conflictingly told. So, while the two caravels were tacking to and fro, and the flag-ship was holding a steady course, Columbus addressed the assembly, relating what had occurred and truthfully setting forth the demands of his crew. Thereupon Pinzon gave his views simply and fully, adding his condemnation of the malcontents. "Señor," cried the brave shipmaster of Palos, addressing the chief, "your grace should hang half a dozen of these fellows and throw them overboard, and if this likes you not, I and my brothers will bear down on them and do it; for a fleet obeying the orders of such exalted princes must not return without good tidings." Hearing this, in plain Castilian, from a man of such large experience, the grumblers consented to share Columbus's fortunes and returned to orderly obedience.

When the admiral witnessed the moral power of Pinzon over the crew of the flagship, he thanked him with suffused eyes and saddened voice, saying, "May fortune ever attend you!" After this benediction, turning to his comrades, and doubtless feeling in his heart that they were not far wrong in view of the indefinite prolongation of the voyage, he added, "Martin Alonso, let us do these hidalgos right; let us sail on a few days more, and if therein we sight no land, we will give another order touching our course." The lieutenant deemed this a needless concession to the malcontents, and in a voice that rose above the tumult of wind and wave he cried, "Forward! forward! forward!" This

thrice-repeated cry, from one of such sturdy will and iron mold, saved the expedition, even as his tireless efforts had aided and equipped it at the outset. Whatever the later acts of Pinzon may have been, let us suspend judgment upon them; it behoves us now to declare that by his steadfast resoluteness in this supreme hour he merits an equal share with Columbus in the unfading glory of the discovery of America.

But in truth none of those who took part in the discovery are undeserving of reward, even though they felt the pangs of a terror born of the doubts inseparable from so daring and uncertain an enterprise. Although the sailors knew the duration of the voyage, they were ignorant of the actual distance they had come. Columbus, as we have said, kept the real runs a secret. On October 1 the pilot of the flag-ship reckoned that they had run from the meridian of the island of Ferro some 578 leagues, while the admiral knew that they had come 707 leagues. About this same time the *Pinta's* reckoning was 634 leagues from Ferro, while the *Niña* made it 540. While sailing thus, one of the Pinzons, from the masthead, cried, "Land!" The cry fell like a paschal peal upon the ears of these mariners, who had given themselves up for lost and doomed to die in the fathomless vast. When Columbus heard the glad cry, he kneeled in rapture on the deck, and with devoutly clasped hands, lifting his joy-filled eyes to heaven, intoned the "Gloria in Excelsis" to the author of all created things.

But all this fervor was in vain. No land appeared; rather the semblance of it vanished as they drew near the spot where the deceptive mirage had beguiled their sight and hopes. A phenomenon like that often produced by an ardent sun among the Libyan sands had been repeated upon the Atlantic. Twice the two caravels, which went ahead at the flag-ship's orders, seemed to behold a dim continent near by, as unreal in sooth as the vague longings and unsubstantial visions of the mind. The sovereigns, among the orders given previous to the sailing of the expedition, had assigned 10,000 maravedís to him who should first see land. Even as the crew, before their fruitless revolt, frustrated in its inception, saw naught before them save the abyss of annihilation, so now, by one of those common mental reactions, all felt the pulsings of a newer and higher life, and beheld the signs of a new world amid the waves. And this assurance, following hard upon their old dependency, took such deep hold on their minds, that they imagined the steadfast westerly course commanded by their leader was leaving undiscovered islands on each side of their track. We may thus comprehend how the sailors of the *Niña* were so far led away as to fire a gun and to hoist their

flag before a mere mirage. To avert the recurrence of such mistakes, the admiral gave orders peremptorily excluding from the royal prize any one who should cry "Land!" if his announcement were not verified within three days. The frequent raising of false hopes might well bring about renewed disheartenment, which, by begetting outbreaks, would defeat the purpose of the expedition. But to humor the Pinzons after their undeception, and as they continued to tack to and fro some fifteen leagues around the flag-ship, by reason of their impatience and the greater speed of their vessels, Columbus heeded their wishes and, deviating a little from the latitude of Ferro, which he had hitherto followed, turned toward the southwest. As the middle of October drew nigh, birds flocked around the caravels in increasing numbers, and with each day's progress the hopes of making land grew stronger. Pinzon showed the admiral that it was indispensable not only to shape their course by the stars but also by the flight of the birds, as the Portuguese had done before, whereby the latter had discovered the islands already added to their far-stretching dominions. For the birds not only hovered about the ships in the infinite solitude, gladdening the eye with their gay plumage and filling the air with their twitterings, but, like true guiding pilots, went on before toward the land.

It was the afternoon of October 11, 1492. The signs of land now made it high time to prepare for the approaching disembarkation, for which all needful measures had been ripely planned by the admiral, who in fifteen years had never for an instant doubted the realization of his predictions. He began by heaving the lead, and found bottom instead of the hitherto unfathomable deep. He eagerly scanned the cloud-banks, those mysterious counterfeits of coast and shore so keenly watched by the practical sailor. He also attentively regarded every faint breath of air, and was reassured; for the breezes shifted and blew from every quarter, a sure indication of the irregular conformation and the sinuosity of land near by, in contrast with the winds of the watery waste whose sameness fitly lent constancy to its currents of air. He ordered the sails to be lowered when he should give the word, the other caravels running alongside the flag-ship and heaving to. In these orders he laid stress on the need of coming within unmistakable range of the shore before crying "Land!" and he added a gaudy trifle in the shape of a satin jerkin to the prize offered by the sovereigns for the first announcement of the discovery. Had Columbus kept the course he laid on leaving Ferro, his landfall would have been in the Florida of to-day, that is, upon the main continent; but owing

to the deflection suggested by the Pinzons, and tardily accepted by him, it was his hap to strike an island, very fair to look upon, but small and insignificant when compared with the vast island-world in whose waters he was already sailing. Let us not, however, forestall events, but confine ourselves to the historical narrative in due order of time. Each moment brought a revelation. A solitary half-tame turtle-dove flew near them. The dove was soon followed by a floating leafy reed, wherein, gazing upon it from the deck of the *Santa Maria*, Columbus pictured some broad sea-marsh clinging to the skirts of the firm land. Scarcely had the crew of the flagship seen this green reed, when from the *Niña* was sighted a branch of hawthorn, such as crowns the hedge-rows of Andalusia, laden with ripe, lustrous berries of coral and crimson. But the *Pinta* was the most favored of them all, for she met with an object that positively demonstrated the existence of human beings near by, amid the endless sea that stretched around the voyagers. A floating log was seen; the net was cast, and like a fish snared in its meshes the log was brought on board. It proved to be skilfully carved, another sure promise of finding the land they sought. The tidings were borne to Columbus. In the full assurance that he was nearing land, he determined to retire to his cabin and to hold communion with his inmost thoughts. But first he knelt in prayer.

IT was eight in the evening of Thursday, October 11. Columbus, after having performed his daily devotions and refreshed himself, went on deck and eagerly scanned the western space. He stood alone. He had scarcely slept since leaving Palos, and none of his comrades slumbered that night. Standing there, apart, for each sailor was keeping watch in his own place, and performing his allotted duties, after an hour of intense self-communion, with eyes fixed on the surrounding scene, a glad cry leaped from his heart. He had seen a light on land, a light unlike the stars above or the phosphorescent gleam of the waves. He summoned Pedro Gutierrez, chamberlain in the king's service, who had joined him at Palos, and who by reason of his dignity and rank was his constant associate, telling him how his eyes had seen a light, and asking him if indeed he too could see it with his less excited eyes. The chamberlain answered that he saw the light, but in his joy Columbus could scarce credit this assurance, so welcome to his own agitated mind. To be still more certain, the two called to them the purveyor of the fleet, Rodrigo de Segovia. But, probably because he was expected to see something, he saw nothing. The horizon re-

lapsed into obscurity, and Columbus into his old anxiety. The little squadron sailed swiftly on before a brisk and favorable breeze. Although close-reefed, the steady wind wafted them on their course. Columbus passed half the night on deck, motionless and chill as a statue, wrapped in ecstatic thought. He knew that the *Pinta* and the *Niña*, being swifter ships, were the more likely first to sight land, and so he allowed them to precede him, thinking of naught in that supreme hour save the speediest realization of the coveted discovery. That good fortune fell to the *Pinta*. At about two in the morning of October 12, amid the sheen of the stars and the phosphorescence of the sea, one of the crew, a native of Seville, keen of sight and with eyes accustomed like some nocturnal creature to the darkness, cried, "Land!" And when he uttered this cry, Martin Alonso Pinzon fired a gun, whose resounding echoes carried consolation to the feverishly expectant sailors, who had well nigh lost faith in the evidence of their own senses, after their prolonged doubts and trials.

Columbus donned his richest apparel, flung upon his shoulders a cloak of rosy purple, grasped in one hand the sword of combat and in the other the Redeemer's cross, and, standing beneath the sovereign banner, spread like a canopy above his head, and gold-embroidered with the royal initials and the Castilian crown, he assembled all the chief comrades of his voyage about him as in a peerless court pageant. Then, disembarking, he knelt upon the land, raised his eyes heavenward, and with uplifted arms joined with his followers in a *Te Deum*. The miracle was wrought at last, and wrought by faith. He who pens these words, on reading the lines of the great poet Schiller upon Columbus, found therein a philosophical thought, as original as profound, calling upon the discoverer to press ever onward, for a new world will surely arise for him, inasmuch as whatever is promised by genius is always fulfilled by nature. And, musing thereon, I thus expanded that thought as a fitting close to this part of my story of the discovery: When I regard this achievement, the most living, evident, and effulgent lesson it bears is the triumph of Faith. To cross the seas of life, naught suffices save the bark of Faith. In that bark the undoubting Columbus set sail, and at his journey's end found a new world. Had that world not then existed, God would have created it in the solitude of the Atlantic, if to no other end than to reward the faith and the constancy of that great man. America was discovered because Columbus possessed a living faith in his ideal, in himself, and in his God!

## WHEN ANGRY, COUNT A HUNDRED.

THE dining-room of a house on Fifth Avenue. Personages: the host, hostess, and guests, irreproachable in manner, unapproachable in costume, politely engaged in conversation—all but Mr. Alfred Ames and Miss Eva Rosewarne, who, seated side by side, regard in silence their respective bouquets, which lie upon the tablecloth. Servants move behind the guests. The stage-business proceeds with conventionality. Flowers and lights.

*Alfred* (slightly embarrassed): Miss Rosewarne, I hope you will believe me when I say that I'm not to blame for this. Until I read your name in the billet handed me as I came into the house, I had no idea that you were to be here. And yet, if I had known, what could I have done? One can free himself from a dinner engagement only by means of suicide. Our short-lived romance was quite unknown to anybody but ourselves; Mrs. Leclerc supposed that she was doing me a great favor—kind hostess that she is—in giving me a place next to you at her table. Oh, how happy it would have made me a few weeks earlier! I confess that just now, when I read your name, I felt a sudden, unreasonable sort of thrill. Not of hope, of course. Probably it was some kind of reflex action of despair, not altogether unpleasant. You took my arm silently. All the way down-stairs I was trying to judge whether you were annoyed or indifferent at this unexpected meeting; but you gave no sign. I have not forgotten that, a fortnight ago, you said you never would speak to me again; and heaven defend me from expecting the impossible, that a woman should change her mind, or speak when she had resolved not to do so! I shall not ask you to talk to me,—I am afraid that you would not say anything kind if you should,—but I beg as a great favor, not to me, but to Mrs. Leclerc, who has done nothing to offend you, that you will appear to be on the ordinary terms of acquaintance with me.

*Eva* (regards him for an instant in silence, takes up her bouquet, examines it, and lays it down upon the table again).

*Alfred*: I wish to spare you as much as possible. I will gladly do more than my share of the talking. In those other days, when we

were friends, I never had much practice at that, but I dare say I can manage it. Ah! I have an idea—not a very brilliant one, perhaps; but it may serve. Miss Rosewarne—of course it is an absurdity, but it may be the best means for our—pardon the pronoun—our charitable purpose toward Mrs. Leclerc. This is it: I once heard of a man who, for some reason or other, had nothing to say one evening at table. So he turned to his neighbor and began to count one, two, three, four, with expression. Will you do that—for the sake of our hostess? It commits you to nothing. It surely is n't talking to me. What information can I get from hearing the numerals recited in the tones of polite society? I know that you are offended with me, perhaps with good reason; but the philosophers advise one, "When angry, count a hundred." You will surely not mind counting the hundred aloud? It will save the situation. Once more, let me ask you to do so for the sake of Mrs. Leclerc.

*Eva* (assents by a bend of her golden head).

*Alfred*: Thank you—if I may presume so far. I am glad that I never vowed not to speak to you; it seems to me that there are so many things to be said. And since I expect to sail for Europe in a few days, to be gone indefinitely, perhaps, like any other condemned man, I may be allowed a few last words.

*Eva*: One, two, three, four, five, six, seven.

*Alfred*: You know that I loved you with my whole heart—

*Eva* (with haste): Eight, nine—

*Alfred*: And now, at this moment, trying to recall the beginning of the end, I cannot find any reason why you and I should be farther apart than if the Atlantic were already between us. How did the trouble arise? The cloud was not so large as a man's hand; it was very small, microscopic—perhaps about the size of your own hand. But it completely covered the heavens for me. But to you, of course, it made no difference. When a cloud comes between the earth and the sun, it is only the terrestrials who put up their umbrellas. The sun continues to shine.

*Eva* (pensively): Ten, eleven, twelve.

*Alfred*: I did not ask you to explain to me in what way I had displeased you, nor to divide your part from mine in the quarrel. You are still angry with me, but I shall always be grateful to you. For a few days I lived in Paradise; and it is n't every man who can say as

much. It gives one, afterward,—there is a great deal of *afterward* in life, Miss Rosewarne,—an ideal with which to compare other things, and find them wanting. And if one absolutely must leave Paradise, 't is at least more bearable to be evicted by Eve—pardon me, it was her name, you know, a great while before it was yours—than to be chased out of it by the serpent. There was no serpent in my Eden!

*Eva* (with a little cynicism): Thirteen, fourteen, fifteen, sixteen!

*Alfred*: Ah, you are right. Of course he was there, glittering with—orders of merit. Also, he waltzed like an angel of light—you told me so that evening at the Casino. But if you preferred Count von Waldberg to my humble self, you might at least have said so frankly. I would not have stood in the way of your happiness; and it would have spared me some examinations of conscience.

*Eva* (reproachfully): Seventeen, eighteen.

*Alfred*: You were so good as to say that you—liked me, and I believed it. Now, you have taught me to disbelieve; I only wish that I could doubt the sincerity with which, when you gave back my ring, you told me that you hated me.

*Eva* (deprecatingly, but coldly): Nineteen, twenty.

*Alfred*: Mrs. Leclerc is looking at us. Say something kind to me—for her sake!

*Eva* (cheerfully): Twenty-one, twenty-two, twenty-three, twenty-four, twenty-five, twenty-six, twenty-seven, twenty-eight!

*Alfred*: A thousand thanks. She is quite satisfied that we are enjoying ourselves.

*Eva* (with a shade of coquetry): Twenty-nine, thirty?

*Alfred*: Oh, immensely—no—yes—that is to say, not precisely. However, I mean to improve my opportunity, such as it is. For my own honor, it seems to me that I must say certain things, and I beg you to listen with patience. Are not you glad that we are to have Italian opera at the Academy this winter, instead of Wagner?

*Eva* (with astonishment): Thirty-one, thirty-two, thirty-three!

*Alfred*: Major Starr was listening to us just then. Now he is talking again. The usual thing, I believe, is to say that because you have disappointed me I shall lose faith in all women. It won't have that effect with me, I fancy, though I should have liked to believe in you too.

*Eva* (with bitterness): Thirty-four, thirty-five, thirty-six.

*Alfred*: I think that neither you nor I can ever forget those evenings on the river: it will be a dainty aquarelle in your mind; in mine

the scene is an etching, every line inalterable. That sort of thing is bitten in with aqua fortis, you know. I should be glad to think that that you too would remember—of course as a pretty idyllic landscape, nothing more—the yellowish light, half sunset, half moonrise; the dipping boughs of the willows; the shadows among the reeds, which crept farther and farther into the middle of the stream; the birds that called drowsily in their nests; a light which gleamed from a cottage window; and a stately white swan that floated past us upon the current. I remember telling you that that swan might be a sister of yours, under some enchantment. I too was under an enchantment that evening. I rather think it made me appear like a goose. On the whole, you need not remember that occasion, Miss Rosewarne!

*Eva* (sadly): Thirty-seven, thirty-eight, thirty-nine, forty, forty-one.

*Alfred*: And in the morning, as I waited on the cliff for you to appear, I understood how the earth waits for the dawn to illuminate it, to give it new life. Well, I have had my day; it was bright, but the sunset came too soon.

*Eva* (dreamily): Forty-two, forty-three, forty-four.

*Alfred*: The sea sang of you, the waves sparkled for you, all the sirens had given their magic to you, and their harping must have been like the sound of the sea-wind in your hair.

*Eva* (with an effort at mockery): Forty-five, forty-six!

*Alfred*: Your criticism is deserved. My expressions do sound rather too lyric and high-flown. It was, in fact, an extract from a semi-rhythmic ode, "To Her," which was to have been published—at my own expense.

*Eva* (sarcastically): Forty-seven, forty-eight, forty-nine, fifty.

*Alfred*: I tell you all this now, because there is nothing else to be done with these poor little fancies of mine—bubbles of foam that gleamed for a moment, and broke. They were of no use to any one but the owner, and, good heavens! it is little they have availed even him! They will remain unpublished—also at my own expense.

*Eva* (tears a flower of her bouquet).

*Alfred*: At least they may give you a moment's amusement.

*Eva* (with affected gaiety): Forty-seven, forty-eight!

*Alfred*: If you really think them so comic, let me go on. I dreamed of you—don't you like the present way of arranging the flowers low, so that one has n't to peep this side and that of a mountain of roses?

*Eva* (with enthusiasm): Forty-nine, fifty, fifty-one, fifty-two, fifty-three, fifty-four, fifty-five, fifty-six!

*Alfred*: Thank you again; for a briefer answer might have led Major Starr to suspect that my conversation failed to interest you. As I was saying, I dreamed of you, and of you only. I still dream —

*Eva* (hurriedly): Fifty-seven, fifty-eight, fifty-nine, sixty, sixty-one, sixty-two, sixty-three, sixty-four, sixty-five, sixty-six, sixty-seven, sixty-eight —

*Alfred*: Don't be disturbed. I quite understand that dreams are illusions. I am awake; very thoroughly.

*Eva* (softly): Sixty-nine, seventy, seventy-one, seventy-two.

*Alfred*: It is better to wake than to dream; but if one has no more pleasure in either—then best to sleep soundly.

*Eva* (puzzled, slightly alarmed): Seventy-three, seventy-four, seventy-five?

*Alfred*: I mean, since one must exist,—there seems to be that necessity, in spite of the old Frenchman,—that business is a rather good opiate. The palpitant voice of the ticker never records fluctuations of the heart, only of the stock-market. No shy loves seek to hide from observation in a corner of wheat. The bonds of Flint and Père Marquette are not those of tenderness and priestly blessing. As I said, I expect to sail in a few days for Europe; in any case, one of the firm would have to go there.

*Eva* (with resignation): Seventy-six.

*Alfred*: I have tried again and again to retrace those parted ways, back to the path where, for a little while, we walked together. A dry and wearisome road it may have been for you. For me, as I have told you, it was the way of Paradise. I began to suspect the presence of the inconvenient third party of the legend of Eden at that Casino ball. You remember; the evening when you wore a gown of some sort of cloth which had the tint of a blush-rose, adorably fitted, hanging in smooth, heavy folds, trimmed with—trimmed with—well, I suppose it was tape—

*Eva* (with horror): Seventy-seven!

*Alfred*: How stupid of me! Of course it was n't tape. I used to be posted on the difference between tape and bombazine and lace and things in those other days when you were so good as to explain it to me. At all events, that was a delicious gown.

*Eva* (with conviction): Seventy-eight, seventy-nine.

*Alfred*: You had told me to come early to the Casino. I was n't fashionably late as it was, but should have been there a half-hour sooner only Jacky Vane, poor old chap, was ill, and wanted me to look in on him, on my way: said it would be a bracing tonic for him to see a man in evening clothes, going to have some fun. Great fun I was to have that evening!

For when I found you, your eyebrows were arched, and your lips compressed in a little way of yours. I knew that look; I had enjoyed it when it was caused by other men. I spoke to you, and your voice was menacingly sweet. You let me take your program of dances; the trail of the serpent—pardon me, I should say the autograph of Count von Waldberg—was over it all.

*Eva* (deprecatingly): Eighty, eighty-one, eighty-two.

*Alfred*: I know that. It 's quite true that I had a poor little lancers, a quadrille, and the fag-end of a mazurka. But the waltz—our waltz, the "Garden of Sleep"—you danced with the Count.

*Eva* (protesting): Eighty-three, eighty-four, eighty-five.

*Alfred*: Of course he asked for it. But you have a thousand pretty ways of saying no. You could have kept that waltz for me.

*Eva* (timidly): Eighty-six, eighty-seven.

*Alfred*: Well, let that pass. I suggested, as considerably as I knew how, that you were giving rather too many dances to Count von Waldberg. You replied that those numbers were at your disposal when he took your card, and you chose to give them to him.

*Eva* (poignantly): Eighty-eight!

*Alfred* (looking at her with sudden intelligence): Reserved! If I had understood that! Now I dare not even hint my thanks for what—I did not have.

*Eva* (with recovered composure): Eighty-nine, ninety.

*Alfred*: Is there anything more cruel than the sarcasm of a dance when one is unhappy? As we went to take our places in the lancers, your hand rested light and cold as a snowflake on my arm, without the delicate confiding touch that formerly made me thrill with a wild wish to tame the whole world so that you might drive it as you do your ponies; with an immense delight in which was also a bitter-sweet sense of my unworthiness of you. We stood side by side in the set; our vis-à-vis were a disillusioned couple, husband and wife, who danced together that evening so that the world should not guess that they were about to separate formally. At our right stood a pale girl, with the dissipated old millionaire to whom her mother—selling her like a dove in the temple—had married her. At our left, a woman whose thin little hands hook like bats' claws upon the edge of society, and who by various ways and means contrives to live upon gifts and a mild sort of blackmail; at her side was a young man, more wealthy than wary, who, they say, is paying a good deal for his fun. Among these cynical and deceived persons, we alone represented, to all appearances, happiness and confidence. I declare to you that not one of them

was so miserable as I. For one must have risen high in order to fall far. They had expected little, and got less. I, for a moment, had known perfect content. It is colder to be shut out than never to have entered. And what do you think of this imported notion of a Théâtre Libre?

*Eva* (startled): Ninety-one, ninety-two, ninety-three!

*Alfred*: Pardon the abrupt change of subject. But Mrs. Leclerc had a very curious look on her face.

*Eva* (acquiescent): Ninety-four, ninety-five.

*Alfred*: If Count von Waldberg pleased you, there was certainly no reason that you should not like him. He's a very good fellow, I believe, and he dances remarkably well. As my rival, he was *ex officio* hateful—not upon personal grounds. Moreover, he has gone back to his own country, and rather suddenly. I like that about him; it's a case where the absent is in the right. Then, too, I'm inclined to pity Von Waldberg; for one does n't, by his own will, lose his chances of waltzing with Miss Rosewarne. You must have given him leave of absence. I begin to feel for the Count as a brother in misfortune.

*Eva* (reprovingly): Ninety-six, ninety-seven.

*Alfred*: I accept the reproof. I have no right to guess at what may have taken place between yourself and Count von Waldberg. It was impertinent, but decidedly agreeable, that surmise of mine.

*Eva* (with increased coldness): Ninety-eight.

*Alfred*: I'm always saying the wrong thing. You are very indulgent to let me talk so much. You sha'n't be annoyed this way again, if I can prevent it. Remember, I had not the least idea that we were to meet this evening.

*Eva* (drops her eyelids demurely).

*Alfred* (perceiving the possibility that she may have been better informed than he, conceals his satisfaction): But this time it seems to me I must speak—and then forever after be silent.

*Eva* (mockingly): Ninety-nine!

*Alfred*: That's a quotation from— from—in fact—something that I was interested, a while ago, to coach myself upon.

*Eva* (with marked indifference): One hundred.

*Alfred*: You have reached the hundred. And you are still angry, I'm afraid. It would be asking too much of your kindness—to Mrs. Leclerc—that you should count a second hundred. What can be done, then? (He pauses for a moment, then resumes:) Ah! if by chance it seems to you that you have said anything which you would rather have left unsaid, or said differently,—we all do that sometimes, you know,—you could retract it by

counting that same hundred backward, down to nothing again. Isn't that a pretty good scheme?

*Eva* (assenting): Ninety-nine.

*Alfred*: I think, with a little economy, you can make that double back-action hundred last until Mrs. Leclerc begins to "collect eyes" for the exit of the women. You can be epigrammatic, staccato, like the French novelists. When you lisp in numbers, they need n't come too many at once. I know your intonations so well that words are hardly needed to convey—or conceal—your meaning.

*Eva*: Ninety-eight.

*Alfred*: Quite so.

*Eva*: Ninety-seven.

*Alfred*: Perfectly.

*Eva*: Ninety-six.

*Alfred*: I'll take my affidavit to that (they both laugh, but carefully, without participation in each other's amusement). This is capital. Mrs. Leclerc is sure that we are getting on famously.

*Eva*: Ninety-five, ninety-four—

*Alfred*: Take care; don't be a spendthrift of your numbers. You might—if you would n't mind doing it—smile at me now and then, instead of speaking. Only to save the numerals, of course.

*Eva* (cannot help smiling).

*Alfred* (receiving her smile with impersonal gravity): Oh, this is a comedy that we are playing! But for me it is also a tragedy. A rather poor and ineffective one, it is true. I am thirty years old. I know that this is n't the end of all things. I shall probably live forty years more, make and lose on the Stock Exchange, go about like the others, smoke lots of cigars, play whist, settle down into a comfortable old club-man, and perhaps forget that pale pink gown trimmed with—well, never mind the trimming. But just now it seems to me that my whole spirit is in revolution.

*Eva*: Ninety-three.

*Alfred*: Very much like "93," as Victor Hugo has described it.

*Eva*: Ninety-two.

*Alfred*: I had built so many castles in air, and you were chatelaine of them all. Everything had a reason for existence, everything was good, as soon as your image took its place in my thoughts and harmonized them. For you, it seemed to me, I had been always existing; the things which I had done, or left undone,—and there were a great many of the latter sort of thing,—all appeared to have led me straight toward you. Now—I'm saying it awkwardly enough! but my life has ceased to be logical; in fact, it has gone all to pieces. I shall pick up the pieces, of course,—I'm not a whimpering boy,—and glue them, screw them, clamp them, tie them together, anyhow,

DRAWN BY A. B. WENZELL

"ALFRED STOOPS TO PICK UP HER BOUQUET."

provided they stick. But I don't pretend that the outfit will be as good as new, or as it was before it was broken up.

*Eva* (with remorse): Ninety-one, ninety, eighty-nine, eighty-eight, eighty-seven, eighty-six.

*Alfred*: 'T was not your fault. You could n't help it. I did not deserve you; only I loved you with all my soul, as,— heaven help me! I love you, love you now!

*Eva* (in extreme agitation, very pale, rattles off the numbers down to sixteen, and stops there for want of breath).

*Alfred*: Poor beautiful child, do not be afraid. I will not offend in this way again. I only meant to tell you that amid the ruins of my fallen castle there blossoms an imperishable flower— my affection for you. Everything else is shattered and destroyed; but that love, once sprung up, is immortal. It bloomed, it still blooms, for your hand; but the little hand will not deign to gather it. Its perfume is always shed for you, but you prefer the incense of the crowd

of worshippers. You have heard me patiently and courteously; you have kindly seconded my attempts to act a sad little comedy of good will, for the sake of our hostess and her guests. For so much, I thank you. Now everything is ended. See, Mrs. Leclerc is looking around the table to rally her feminine troop.

*Eva* (counting desperately, and ending with the number) three.

*Alfred*: And so, it is good-by— definitively. Because when we meet in future, if ever, it will be as mere acquaintances who have nothing to say to each other except the commonplaces of society. We, who were to have been united, must henceforward be (he stops short, surprised by an emotion that chokes his voice of a man of the world)—

*Eva* (boldly skipping a number): One! (She recklessly drops her bouquet as she rises with the other women.)

*Alfred* (stoops to pick up her bouquet, kisses the hand of *Eva* under the table, and says in a rapturous undertone): One forever!

*E. Cavazza.*

## THE APOTHEOSIS OF GOLF.<sup>1</sup>

*"Habent sua fata libelli."*

AMES, too, like nations, religions, arts, forms of government, and other ephemeral things, have their day, emerge from obscurity into renown, pass away, are forgotten, and in some cases rise again, only to be superseded once more; for although there is nothing new under the sun, nothing that has not some false air of novelty will please the fickle race to which we have the honor to belong.

Now it has long been the especial boast of golf that it is not a new game. In Scotland, the land of its misty origin, it is known by the appellations of "Royal and Ancient," being able to show a fair claim to both titles, inasmuch as King James VI. of that country and I. of England is said to have been a keen player, while everybody has heard the story of how Charles I. was interrupted in the middle of a match at Leith by a despatch which brought him the news of the Irish rebellion. From those times down to our own the game has been played and loved upon those long Caledonian stretches of waste land which border the sea, and which are, indeed, essential to its highest development; but it can hardly be said to have made its way south of the Tweed until the other day. There have, of course, been for many years past a few

English clubs—such as Blackheath, Wimbledon, and Westward Ho; but for some reason or other the game did not commend itself to the average Englishman (whom, as being myself an average Englishman, I may perhaps be permitted to call a prejudiced being), and it is only now that golf has suddenly become popular among us.

It is, however, exceedingly popular now. Not only at every seaside watering-place, where the natural features of the locality may or may not be suitable for the purpose, but on inland commons, where they cannot be, and even in private parks, where there are no "hazards," and where the putting-greens are rolled once a month or thereabouts, enthusiastic gentlemen, with scarlet coats and complexions, may be seen vigorously plowing up the turf with misdirected strokes, while as often as not they are accompanied by their wives, their sisters, their female cousins, or the young women to whom they are engaged to be married, these also being armed with golf-clubs, and apparently taking an active part in the pastime.

The old golfer looks on at such exhibitions and shakes his hoary head. It is all very fine, he says, but it is not golf—which is much as though an old whist-player should inform you across the card-table that your game is not

<sup>1</sup> All the pictures except the first are drawn by H. D. Nichols from photographs made for this article.

whist. Most of us know how very offensive and uncalled for remarks of that kind are; but the young players don't seem to mind the old golfer. Possibly, for the matter of that, they don't so very much care whether they are playing golf or not. They have at least discovered a recreation which for them has the charm of novelty (it has something of the same charm for those who watch them, too), which is undoubtedly healthy, and which makes them happy for the time being. What more can be asked or required of any game?

Well, some people ask for a little more than that; and there is a great deal more than that in golf—so much more that the subject cannot by any possibility be fully treated of in a brief article. Books—very long books, some of them—have been written upon the subject; paid professors of the art are scattered broadcast over the land. As well might one attempt to teach a man how to play the fiddle in a few pages as to initiate him within so limited a space into the mysteries of driving, approaching, lofting, and putting. Yet I suppose that no man ever yet learned to play the fiddle by means of treatises, long or short; so that there is not, I trust, any unwarrantable presumption in this effort of a very mediocre performer to urge his readers toward active study of one of the finest games in existence. Nevertheless, I should

feel greatly obliged to the well-informed if they would kindly turn their backs upon me. Not to masters of the craft do I venture to address myself; not to players of the second or third class; not even to those who have taken to the game within the last year. These latter know all about it,—or, at any rate, they think they do, which for practical purposes amounts to the same thing,—and they cannot wish to hear again what their instructor, if he has been in any degree a conscientious man, must have told them so many times already. Readers of the following remarks must be assumed to be in a state of blank ignorance, so far as golf is concerned; and I am assured that quite a large number of such persons may be found on the other side of the Atlantic, though perhaps only a few yet remain on this.

In that volume of the Badminton Library which is devoted to golf, Mr. Horace Hutchinson quotes the statement of an Oxford tutor that the game consists in “putting little balls into little holes with instruments very ill adapted to the purpose.” To assume that the instruments used were ill adapted to their purpose was natural enough on the part of an erudite, and probably impatient, gentleman who had not learned how to use them: otherwise, his

SPECIMENS OF CLUBS.

- 1, Wooden putter; 2, Cleek; 3, Mashie; 4, Driver; 5, Short spoon; 6, Niblick; 7, Iron putter; 8, Long spoon; 9, Sand-iron; 10, Brassy.

definition may be accepted as substantially correct. The game consists in that; and the player's object is to place his ball in the hole in fewer strokes than his opponent. This sounds a little dull; and doubtless the amusement would be as dull as marbles, or duller, if it were engaged in upon a smooth-shaven lawn. What lends golf the variety which is its chief fascination is that the game is played, not upon lawns, but over long reaches of broken country, the surface of which is diversified by sand-hills, patches of “whins” or gorse, rushes, stone walls, coarse grass, cart-ruts, and other obstacles, upon which has been bestowed the generic name of “hazards.” During its progress from one hole to another the “little ball” is only too apt to land in a hazard, and, when there, it must be played out—an operation in performing which a good many strokes are sometimes expended. On some greens the player is permitted to lift his ball out of a hazard and to drop it over the back of his head, so that it falls on clear ground, and for this privilege he has to pay a penalty of one or two strokes; but at St. Andrew's, which may be considered the headquarters of golf, this is not allowed, nor (as is the custom in many places) may a player who cannot find his ball drop

PREPARING FOR A DRIVE.

another as near as possible to the spot from which he struck it, under a penalty of a stroke. By the St. Andrew's rules, a lost ball is a lost hole.

The course consists either of eighteen or nine holes,—it is a question of available space,—and in the former case it usually measures about three miles in length, while in the latter it would be something like half as long. But there is no fixed rule upon the subject, nor are the holes equidistant from one another. At Westward Ho, to take the first typical example that comes to hand, the longest hole is 462 yards, the shortest is 205, and the average length would be 320, or thereabouts. A match may be played either by two or by four persons; but only two balls are used, and in a "foursome" the partners play alternate strokes. When it has been added that the holes are  $4\frac{1}{4}$  inches in diameter, and that the balls, which are made of very hard gutta-percha, have a circumference of about  $5\frac{1}{2}$  inches, enough will perhaps have been said upon the subject of measurements.

Now, it is obvious that, in order to propel the ball over such a course as has been described, and to accomplish the round in an average of five strokes to each hole (which, although creditable, would not be an extraordinarily good score), more than one species of implement is requisite. The ball may be lying beautifully on close-cropped turf, where you can get a good sweeping stroke at it, or it may, by reason of your bad play or bad luck, have landed in sand or in a wilderness of gorse, out of which you must force it as best you can. Again the surface of the turf is uneven, and a "cuppy lie" is apt to be a more troublesome thing than it looks to beginners. As you approach the little fluttering flag which marks the position of the hole, and when you are within, say, sixty or seventy yards of it, your

natural ambition is to land yourself upon the smooth putting-green that surrounds it in your next stroke, and you will find that there is practically only one way of accomplishing the desired object; namely, by a lofting-stroke, which, sending the ball high into the air, causes it to drop perpendicularly, and to roll but a very short distance after it has pitched. Finally, having reached the apparent but deceptive security of the putting-green, you have to "hole out." That is, unless your opponent happens to be one of those rare and generous beings who take it for granted that you cannot miss at a distance of eighteen inches from the hole.

Each of the above-named strokes demands a special club, which, notwithstanding the Oxford professor, is as well adapted to its purpose as experience and ingenuity can make it. Clubs, patent and other, are innumerable; but a good player seldom favors patent devices, and the beginner will do very well if he provides himself with the following equipment of ten: (1) driver, (2) long spoon, (3) short spoon, (4) brassy, (5) driving-iron, (6) lofting-iron, (7) mashy, (8) cleek, (9) niblick, (10) putter. Of these the first four have wooden heads; the remainder, with the exception of the putter, are made of iron. Putters may be constructed of either material; but the metal putter seems to be gradually superseding its wooden rival. It is scarcely necessary to add that somebody is wanted to carry this sheaf of implements for the player, who will probably not care to tuck the burden under his own arm, and upon every golf-links there has sprung up a race of individuals whose mission in life it is to perform this service for a moderate fee. They are called "caddies,"—why I cannot say,—and they may, as is usual in England, be small boys, or, as is more usual in Scotland, be tipsy

THE ACT OF DRIVING—FRONT VIEW.

old men. A word or two shall be said about them presently.

The first stroke to each hole is made from the "tee"; that is to say, from a selected spot which is, or ought to be, nearly level, and where the player has the privilege of raising his ball slightly above the surface of the grass by means of a pinch of sand, so as to increase his chance of hitting it clean. His chance of hitting it clean is, unhappily, a very poor one during the early part of his golfing career. It looks simple enough. Anybody could hit a ball of that size with his walking-stick, and, by hitting pretty hard, ought, you would think, to send it a considerable distance. But what you want to do is to send it at least a hundred and twenty yards in a given direction from the place where you are standing, and a good player will make that small sphere of gutta-percha travel close upon two hundred yards—a figure which is not infrequently exceeded. Such feats are not to be performed by a "hit," properly so called, and the first thing you have to do is to divest your mind, if you can, of all idea of hitting. The long, supple driver, with its slender shaft and its weighted head, should sweep the ball from the ground and dismiss it on its flight through the air; and this it will do without the aid of any muscular strength on your part, provided only that you can contrive to manipulate it as it ought to be manipulated. That, alas! is a large proviso. Space will not permit of detailed instructions here, and whoso hankers after these, let him purchase the admirable Badminton Library volume or "The Art of Golf," by Sir W. Simpson, in both of which books he will find the matter fully and scientifically explained. But the fact is that a few days of practical instruction are more serviceable than hundreds of printed pages, and when once the tyro has realized that he must grip with his *left* hand, not with his right, that he must let the club swing easily back as far as it will go, keeping his arms extended at full length from his body, and that he must on no account allow his eye to wander for the fraction of a second from the ball, he has taken a long step toward the mastering of essentials. The accompanying illustrations of a professional golfer in position for a drive and in the act of driving, from two points of view, will convey an idea of what the swing ought to be. The tyro, however, must not, unless he be very young indeed, expect to acquire so long a back swing as that; nor is it necessary that he should. The main thing is to hit the ball clean, and I should say that his best plan would be to concentrate his attention upon that end, beginning with a half swing and lengthening the segment of the imaginary circle by degrees, should he find himself capable of doing so. As

for the position of his hands, his feet, and his body, these must needs be studied; but until they become a second nature the study is very grievous and perplexing. There was once a painstaking but not particularly brilliant golfer who was wont to declare that a man should think of thirty-six things before making a stroke, and he affirmed that he actually did try to think of the whole six-and-thirty every time that he placed himself in position. I am very sorry to add that this amiable gentleman is now an inmate of a lunatic asylum. And the worst of this story is that it is true.

THE ACT OF DRIVING—BACK VIEW.

The "drive" is not the most difficult, nor even the most important, stroke in the game; but it invariably appears to the uninitiated to be both, and even those who know better are fain to admit that the joy of making a long, clean, straight drive is not quite equaled by that of dropping the ball close to the hole with a well-judged loft from fifty yards. The sensation of sweeping the ball off the tee, neither topping it nor scraping the ground, and of watching it cleave the air like a bullet until it drops beyond the happy striker's ken, yet in the exact direction of the point aimed at, is a thing apart, and is so delightful that the natural exultation caused by winning a hole sinks into insignificance by comparison. So, at least, I am assured; but I may as well confess at once that I am not personally very well acquainted with the sensation referred to. I decline to gratify a purely impertinent curiosity by stating what is the utmost distance to which I have ever succeeded in driving a golf-ball; but I do not mind admitting in general terms that when I win a match (as I sometimes do), the result is not due to my proficiency in that particular line.

A year or two ago I chanced to be playing on the Musselburgh links, attended by one of those aged caddies to whom I referred just

THE APPROACH.

now as being indigenous to Scottish greens, and I shall never forget the look of sorrowful contempt which spread itself over his ill-favored countenance as I made my second tee-shot. The first he had allowed to pass without comment,—probably he thought that I was nervous under his critical scrutiny,—but when I did it again, his opinion of me found vent in language the plainness of which left nothing to be desired. The right of free speech, which is doubtless one of the greatest boons resulting from a constitutional form of government, is exercised in a remarkable degree by these stern and wild Caledonians, and my attendant did not spare me. I was not playing so badly in other respects; but never a word of praise did I get from him, and at each successive tee he fell back, while I placed myself in position, murmuring sadly, “Eh! ye’re no driver!” At this distance of time I can speak of him, I trust, without undue prejudice or resentment; but I must say that he was the very dirtiest old person with whom I have ever been brought into close contact, besides being quite the most uncivil and unfeeling. Nothing could excuse his remarks; but what may perhaps have rendered them especially objectionable to me was that I could not possibly contradict them. For it is a lamentable fact that I am no driver. Happily, however, for me, and for others who resemble me, golf does not consist solely of driving. Your adversary may out-drive you by thirty yards or more, he may increase his lead with his second shot, and yet you may easily catch him and beat him at the hole. As a general rule, it may be said that the driving-club is best reserved for the tee-shot; in playing through the green you will be safer with your spoon or your brassy, which are clubs somewhat similar in construction, but which have the face slightly scooped out, so

as to lift the ball, if it be not lying well. The brassy, as its name implies, is soled with brass, to protect the head from injury by small stones or other “break-clubs,” as they are called. You may require to use your cleek—indeed, you may require to use every weapon in your armory—before you reach the putting-green; but we will assume that you have arrived safely within sixty yards of your goal; and this will bring you to the approach-stroke.

The “approach” is generally admitted to be the most telling stroke in the game, and it is by their deadly approaches that professionals are wont to discomfit the vainglorious amateur. To lay the ball within a foot of the hole from distances varying between seventy and thirty yards is not an easy thing to do; yet they do it, time after time, with marvelous accuracy, and if one is asked how they do it, he can only reply rather feebly that practice has made them perfect. One assertion may be made without fear of contradiction—that they seldom or never do it with a cleek-stroke or a putt, which methods are sometimes employed successfully by the amateur. Strictly speaking, the approach should always be a lofting-stroke. Very often the necessity for this is made obvious by an intervening sand-bunker or group of whins; but even when nothing but a space of grass separates you from the hole it is risky to attempt running a ball along the ground with a cleek or a putter, the inequalities of which are very apt to stop it short or to divert it from its course. If, then, you wish to play the game in the proper way, you will have the choice of three clubs with which to make your approach, the driving-iron being usually employed for the longer, and the lofting-iron or the mashy for the shorter, distances. All three are iron-headed clubs, the lofting-iron being somewhat shorter

PUTTING.

in the shaft and more sloped back in the face than its elder brother, while the mashy, which is a sort of compromise between a lofting-iron and a niblick, and was originally intended to assist the player in getting out of bushes, rushes, and rough ground, ought not properly to be classed among approach-clubs at all. It is, however, a useful little weapon, and, for some reason or other, is, I think, rather easier to play than the lofting-iron.

Lastly comes the difficulty of "putting"; and this, which looks almost ridiculously simple, happens to be, if not the most difficult stroke in the game, probably that by which more holes are lost than by any other. A stroke, it must be remembered, is always a stroke: consequently, if you miss the hole by the eighth of an inch you are just as badly off, though you may not feel quite so furious with yourself as if you had driven a ball twenty yards, instead

STIMIE-LOFTING.

But all approach-shots are hard to play. The beginner invariably makes a mess of them, and the experienced player does so far more frequently than he ought. The attitude which you must adopt in playing them is altogether different from that which you will hitherto have been told to take up. The ball, instead of being almost in a line with your left foot, will now be almost in a line with your right; your left leg will be advanced, and you will stand nearly facing the hole. Your object will be to raise the ball high in the air, so that when it falls it may remain as nearly as possible stationary. The length of your stroke must be regulated wholly and solely by the length of your back swing: under no circumstances must you yield to the temptation to play gently. It is scarcely an exaggeration, in these days, when everybody has taken up golf, to say that the majority of players abandon the correct approach-stroke in despair, and scuffle up to the hole as best they may, trusting to Providence and the chapter of accidents. Nevertheless, the right method remains right, and it is worth persevering with, although no hope of speedy proficiency can be held out.

of six times that distance. And balls have a terrible tendency to miss the hole. The putting-green is carefully mown, rolled, and swept; but it is not absolutely level, and is not intended to be so. Tiny acclivities and depressions have to be taken into account; the dryness or moisture of the turf must be borne in mind; twigs, worm-casts, and other small obstructions (which may be removed with the hand, but not with the club) must be looked out for, and should you be provided with an intelligent caddie, you will do well, before making your putt, to ask him to "give you the line." As often as not—probably more often than not—he will tell you to aim to the right or left of the hole, not directly for it; and if you have faith enough to obey his instructions, you will find that his practised eye has not deceived him. Of course, if you should chance to hit your ball a little too hard, overrun the hole by a couple of yards, miss a second time, and then lose your temper and the hole, you will not be so unreasonable as to blame the poor fellow. Nobody ever does that; and I cannot think why, under such circumstances, caddies are apt to display a mar-

IN A STONE-BUNKER.

velous agility in placing themselves beyond the reach of their employer's club.

Positions for putting are so various that one feels something more than one's accustomed diffidence about dogmatizing on the subject; but I believe any professional would say that the putt ought to be made "off the right leg"; that is, that the weight of the body should rest upon that leg, the left being slightly in advance, with the toe pointing toward the hole. The right elbow should be kept close to the side, and the putter firmly gripped with both hands. Personally, I own to having adopted a style of putting which is considered heterodox; for I am in the habit of laying the forefinger of my right hand down the shaft of the putter. I think that this gives steadiness to my stroke and accuracy to my aim; but I am told that it cannot do either. However, as I remain unconvinced, I benefit, no doubt, by my credulity after a fashion akin to that claimed by the numerous persons who assert that they have been cured of divers diseases by the use of patent medicines that, according to the doctors, could not possibly have cured them.

Nervousness is answerable for many melancholy failures on the putting-green. The match, it may be, is drawing to a close; you are, we will say, "all even" so far, and only one more hole remains to be played after this. Should you lose this one, your antagonist will be "dormy," that is to say, he will be one hole up with one to play; so that, although you may yet halve the match, you will not be able to win it. It is, therefore, essential that you should hole out from a distance of three feet, and there is no earthly reason why you should miss. Yet, alas! you do miss. You played too hastily, or you waited too long, or you loosened your grip of your putter—there are fifty things that you may have done; but the cause of your having done

one or all of them is not far to seek: it is that your nerve has forsaken you at the critical moment. There is no use in thinking about it; but if you must needs think about it, comfort yourself with the reflection that scarcely anybody is exempt from this humiliating malady, and that the man who can be relied upon to hole out at three feet is an awkward customer to tackle, even though his driving be feeble and his approach-play indifferent.

One more distressing and not uncommon experience remains to be noticed in connection with the putting-green. Your opponent's ball may be lying directly between yours and the hole, in such a manner as to bar your passage; and as, by the rules of the game, the ball farthest from the hole must always be played first, your situation is not a comfortable one. If by good luck the obstructing ball should lie within six inches of your own, you will be entitled to remove it; but if not, all you can do is to hole out either by circumventing the obstacle or by playing over it. To circumvent it is only possible when the slope of the ground happens to favor you, and the alternative course, which is called "stimmie-lofting," partakes of the nature of a forlorn hope. Nevertheless, this stroke is performed with great accuracy by professionals, and I have often seen it successfully accomplished (though I have much more often seen it missed) by amateurs. It can only be described as a lofting-stroke in miniature, and the best advice that can be given with respect to it is that, like every other stroke in the game, it must be played firmly. No matter how short the distance to which you may wish to send

IN WHINS.

your ball, you will never attain your object by means of a feeble tap. To hole out in the manner described is highly satisfactory, while failure can scarcely be called disgraceful. There is a general and rather strong feeling that stimpies are unfair, and the question of abolishing them, by compelling the obstructionist to lift his ball while the stroke is being played, has more than once been mooted. It is, however, unlikely that this will ever be done; for the difficulty, as we have seen, is not insurmountable, and no game is improved by the elimination of surmountable difficulties. At the same time, if, after losing a hole through a stimpie, you feel as if it would do you good to call such a mishap "very hard lines," or even to substitute emphatic adjectives for the word "very," your adversary, having won the hole, will probably forgive you.

But this is really the only occasion on which you ought so to express yourself, though you will hardly play a round without being tempted again and again to break out into violent and unseemly language. I do not know why of all games in the world golf should be the most trying to the temper; but of its preëminence in that respect one is soon persuaded, not only by observation of others, which is merely amusing, but by personal experience, which is humbling to the pride. For one thing, it is extremely exasperating to find that what looks so easy is in reality so difficult, and, for another thing, each stroke is made with such deliberation as to render a resultant "foozle" doubly ridiculous; still, one must admit that clumsiness and ignorance merit defeat. What causes a man's gorge to rise against the injustice of Fate is to make a splendid drive, and to discover his ball firmly embedded in a sand-bunker, or buried beneath a stone wall. It is at such moments that he is conscious of a tendency of blood to the head, that he slashes and whacks furiously at the insensible gutta-percha without taking due aim at it, and that by his lack of self-control he converts a misfortune into a disaster. "Keep your temper," like "Keep your eye on the ball," and "Don't press," is one of the elementary precepts which are sure to be instilled into the would-be golfer; but how to put the advice into practice nobody can tell you, because nobody knows. You must do it, or else your play will suffer, that is all. Man being an imitative creature, example is, in this as in all cases, more powerful than precept; but examples of the right kind are not to be met with every day, and at the present moment I can think of only two players whose serenity may be counted upon to remain unshaken by any ordeal. I am acquainted, too, be sure, with a large number whose wrath does not find expression in vehement expletives, or in ludicrous onslaughts upon inanimate ob-

jects; but in spite of the creditable appearance of calm which these gentlemen maintain, they are inwardly raging, and the consequences of inward rage are scarcely, if at all, less calamitous than those of an outward and visible demonstration.

Some months ago I used to play pretty frequently against an opponent whose struggles with himself excited my constant admiration. In the letter of introduction which he brought to me he was described as "a very good fellow, although a parson," and I can testify to the truth of the description, while I must, of course, protest that I am wholly unable to see the significance of the qualification. Not being precisely a first-rate player, he was often in difficulties, and when so situated he would deliver stroke after stroke, without result, in unbroken silence, firmly compressing his lips and betraying his emotion only by an ever-increasing pallor. One day, as we were walking homeward together, he said to me, with a sigh:

"After all, I don't know whether I should n't do better to swear and have done with it. The words are all there, you see, though I don't let them out; and bottling them up as I do only makes me feel like a humbug."

He might have pleaded, in addition, that the process of internal fermentation to which he referred is injurious to health; and indeed, if the words be there, they may perhaps as well come out. Only I wish he had not said it; because now, whenever a hasty expression escapes me (and this does sometimes—though only sometimes, I do assure you—happen), I think to myself, with a certain degree of complacency, "Well, you may be an ass, and, judging by the countenances of the bystanders, nothing but politeness restrains them from calling you so; but at least you are not a humbug." Oh, no; there is no humbug about my ejaculations when they do force themselves into articulate form, nor any ambiguity—nothing of the sort! He who runs may hear them, and he who hears them—that is to say, the small boy who carries my clubs—very often begins to run. I dare say he is right; for there is no knowing what a fool who has lost command of his temper may do next.

But, occasionally, like Horace, *deteriora sequor* (occasionally, only occasionally, mind), *video meliora proboque*. It is not only ignoble but supremely silly to get into a passion with bad luck. One may almost lay it down as an axiom that you will not get out of a bunker while you continue in a passion, and there are even some who maintain that you will never get into a bunker through bad luck alone. These deny the existence of such a thing as bad luck, and trace every imaginable misfortune to bad play. If you did n't know that the bunker was

clean and hard with your iron, it will sail away from its predicament like a swallow on the wing. But to hit the ball clean is exactly what you must not dream of attempting; nor, if you are wise, will you use the iron in a bunker until you have become a player of the first class. The only weapon for you is the niblick, a powerful little club with a stiff shaft and a short, rounded iron head; and as for hitting the ball clean, you would only bury it, were you to do so. What you must do is to deliver a sharp, downward blow, not upon the ball itself, but upon the sand a couple of inches or more behind it, and in this instance you may use all the strength that you possess. Of course it requires some faith to believe that such a stroke will move the ball at all, but, as a matter of fact, it does; and any other kind of stroke will almost certainly get you into still worse trouble. Unfortunately, it is not at all easy to strike two inches behind an object at which you ought not to be looking, but at which you can hardly restrain yourself from looking, and the difficulty is greatly increased by the rule which forbids you to touch the ground with your club when in a hazard. But for this cruel rule, you might make a nice little mark on the surface of the sand to guide your eye; and indeed you are not at all unlikely to do this accidentally—thereby, on some greens, losing the hole, while on others you will be let off with a penalty of a stroke. If you manage to extricate the ball at your first attempt, you may well be thankful: as for dismissing it any distance on its way, you are not trying or expecting to do that. It is far more probable that you will ineffectually labor the earth for several minutes, that you will fill your mouth and eyes with sand, and that you will emerge at length, heated and infuriated, to find that you have played "six more."

All bunkers, however, are not sand-bunkers, and on many links there is no sand at all. Those on which I am accustomed to disport myself are situated in the west country, on downs high above the sea-level, and the only luxuries that we can boast of in the way of hazards are walls, cart-ruts, whins, and stone-bunkers. Not that a stone-bunker is a thing to be despised, or that a ball which has perversely dropped into it can be made to leave it with ease. The niblick, if properly handled, will accomplish wonders; but not even the niblick will avail when the wretched little ball has wedged itself firmly between two fragments of rock. In such a case there is nothing for it but to lift and lose a couple of strokes—which is usually tantamount to losing the hole. I have a very kindly and sympathetic friend who, when he is in these parts, is sometimes good enough to play a match with me, although he is my superior

in your line, or if you did n't know that your ball would roll quite so far, or that the wind would set it round in that direction, then you ought to have known, they say. To such unfeeling persons we will only reply, as Job replied to their prototypes, "No doubt but ye are the people, and wisdom shall die with you." We will not waste our noble ire upon them, but will turn our whole attention to the ball, which we will suppose to be badly bunkered, and therefore in need of it. It lies in one of those sandy hollows, surrounded by miniature cliffs, which are to be met with on all golf-links of the orthodox type, and your first impression will doubtless be that if you can only hit it

by a long way. He is always very sorry when I come to grief.

"In the stone-bunker again!" says he, with an air of mournful consternation. "Dear, dear! But not *badly* in, I trust?"

Now, he must know perfectly well that whenever I am in anything (were it only an investment) I am sure to be badly in; but this does not deter him from cheering me up with suggestions of bright possibilities as we draw near to the fatal spot, nor from standing over me and smiling pleasantly while, after having reached it, I essay obvious impossibilities. Yet I have never picked up one of those stones and hurled it at his head; I feel convinced that I should never be able to forgive myself were I so shamefully to forget myself. All the same, the momentary enjoyment would be intense.

Whins are not, as a rule, quite such stubborn enemies to deal with as stones. You may, it is true, find your ball in the very middle of a clump of gorse-bushes four or five feet high, and then your plight will be a piteous one; but generally speaking, it will be found to be more playable than it looks. The iron, the mashy, and the niblick are powerful weapons, and the ball, when rightly struck by the first of the three, will often travel much farther than the player has dared to anticipate. When it is not rightly struck—well, very terrible things may occur then. Yet golf would be hardly worth playing if there were no hazards, and it is possible that the careful man, who never goes straight for a difficulty in the hope of clearing it, but prefers to play short or to avoid risks by steering a zigzag course, may find his game as lacking in excitement as hunting is to those sportsmen who ride hard only along a road.

For my own part, I have no such complaint to make. Only once, when I did the eighteen holes in 86,—I am well aware that modesty ought to restrain me from referring to that historic event; but I can't help it, I never can help referring to it when I get a chance,—only that once, I say, can I remember to have played a round without falling into trouble of one kind or another. The game, therefore, provides me with quite as much excitement as is good for me at my time of life, and will, I trust, continue to fulfil that useful function as long as I am able to stand up and to swing a club. This, indeed, is the immense merit of golf—that age cannot wither, nor custom stale its infinite variety. You may play a very fair game at three-score years and ten; for no running is required of you, and although stiffened muscles may interfere with the freedom of your stroke, the ball and the club are very good-natured. They will do a great deal for you, provided only that you have learned—assuredly you will have done by that time—how little they stand in need

of assistance from thews and sinews. And you will not weary of their companionship. I cannot pretend to explain how it is that you can play golf day after day and year after year without growing tired of it; I know no other game of which as much could be said; but, Heaven be praised! so it is. I do not suggest that you should play all day long. Hard-worked men, who get only a few weeks' holiday in the course of the year, do this, and enjoy it, and are entitled to their enjoyment; but the ordinary individual had better be satisfied with one round, either in the morning or in the afternoon. This, including his walk or drive to the links and back, will probably occupy him for about three hours, which is neither too long nor too short a time to devote to exercise and oblivion of the manifold worries of existence.

Another merit which may be claimed for golf is its cheapness. You can buy all the clubs that you are likely to want for about \$12, your annual subscription will probably not exceed \$15, balls cost a shilling each, and the remuneration of caddies is in most cases a modest one. In Scotland, however, the caddie is usually a very different being from the ragged juveniles who carry clubs on English greens for sixpence, ninepence, or a shilling. Unlike them, he is a full-grown man; he has the game at his fingers' ends; he is acquainted with every inch of the ground; he knows a great deal better than you do which club you ought to take for any given stroke; he favors you with his advice when you ask for it,—sometimes even when you do not,—and in return for these valuable services he will certainly expect half-a-crown. I am not sure that he is not a little dear at the price; because his utterances are apt to be characterized by such painful frankness, and one's game is not likely to be improved at first by the consciousness that, in the eyes of the beholder, it is a deplorable caricature of what a game ought to be. Still, if you can accustom yourself to his little ways, you will find him very helpful, and you may learn more from playing a match with him than from the careful instruction of a full-blown professional.

Even in England the boys are becoming wonderfully adroit, some of them. Last summer I played two rounds at Bembridge, in the Isle of Wight, with a tiny scrap of a creature whose head hardly reached my elbow, and who beat me without any trouble at all. And, lest anybody should imagine that this does not necessarily imply a high degree of proficiency, I may mention that his scores were 87 and 89. The Bembridge course is a somewhat "trappy" one, the putting-greens were at that time rather difficult to play, owing to a spell of dry weather, and a good player would have had no reason to be ashamed of such a performance.

But that counting of strokes is a bad business, and some of us would not be as fond of golf as we are, if the winner of a match were he who had accomplished the whole round in the lowest score. Happily for us, it is not so. If you hole out in four, while I, through circumstances which I have been unable to control, have taken ten or twelve over it, you have, after all, only won the hole, and at the next hole the tables may be turned. Though I only secure that next hole by one, yet we shall then be all even, and thus the bitterness of memory will be assuaged. It is in what is called medal play, under which system the generality of prizes are competed for, that the score of the whole round must be kept; and it is obvious that under no other system could there be an equal certainty of gaging each player's capacity. That the capacity of every member of a club should be ascertained as nearly as possible is essential, since almost all golf-competitions are handicaps, and the handicapper (unless he wishes to render himself still more unpopular than the fact of his holding that office is already pretty sure to have made him) must be chiefly guided in his estimate of what a man can do by the record of what that man has done. The difficulty of his task is not lessened by the unfortunate propensity of some players to tear up their cards, instead of handing them in, on the conclusion of the round. It is mortifying, no doubt, to have to deliver up a duly attested document, setting forth the fact that you have taken 130 strokes over a round which, if you had been playing in your usual form, you would have accomplished well under 100; but it is rather unpatriotic, perhaps, also rather beneath a man of your well-known magnanimity, to blink that fact; and if you will not tell the truth about it, what is a poor handicapper to do with you? What he assuredly will not do, if he be a sensible man, is to increase your allowance.

There is doubtless satisfaction to be derived from the winning of medals, silver cups, and other trophies; there is satisfaction of a kind in merely trying to win them; but it is seldom upon such contests that the golfer muses, with a retrospective smile of contentment, when he is debarred for a time by circumstances from indulging in his favorite recreation, and when he is fain to solace himself with memories of past days spent upon the links. The hard-fought match which he just managed to win by the last stroke of the last hole; the foursome in which he and his partner worked so well together that they inflicted defeat upon a powerful couple who started by superciliously offering them odds; and the sunshine, the fresh breeze,—all links are breezy,—the springy turf, the pungent, aromatic odor of the wild thyme, the yellow whin-blossoms, the sense of space

and freedom—these are what come back to a man at times, when he is compelled to breathe the exhausted air of some great city, and cause him to wonder why any human being who is able to live in the country should deliberately choose to take up his abode in a town.

Fortunately for the welfare and health of mankind, golf-links have now sprung up, and are springing up, in the neighborhood of most large towns,—I should be afraid to say how many are situated within easy reach of London,—and soon every citizen who wishes to keep his eyes clear, his figure presentable, and his digestion in good order will have only himself to blame if he is driven to resort to that most dreary of all expedients, a daily constitutional.

Perhaps one word ought to be said, in conclusion, about the dangers of the game. These are not serious, nor are accidents common; still accidents do sometimes occur, and they are likely to occur with much more frequency, now that the number of players has been so greatly increased, and that so large a proportion of them are apt to play with the carelessness of inexperience. A golf-ball, it is as well to remember, is a very hard missile which travels through the air at a high rate of speed, and by hitting a man in the right place with it you may kill him as easily as possible. I myself was once knocked over like a rabbit at St. Andrew's by a ball which must, I am sure, have traversed nearly a hundred yards of space before it came into violent contact with my head. In that instance my unintentional assailant, though he was extremely civil and apologetic, was not technically to blame, inasmuch as he had observed the rule of allowing me to play my second shot before he struck off. It was no fault of his that I had made a wretched drive, while it was at once his good fortune and mine that Heaven has granted me a thick skull. But that rule is not invariably observed, nor are players who chance to cross one another on the green always as scrupulous as considerations of prudence ought to make them. An impatient player is apt to think that when he has shouted "Fore!"—which is the recognized danger-signal—he has done all that can be required of him, and may go gaily ahead; but it is often difficult to tell from which direction the warning shout comes, and it is quite possible that the shouter may be himself invisible. The red coat, which is the time-honored uniform of all golf clubs, has its *raison d'être* in the desirability of rendering human figures as conspicuous as may be. Among the many golden rules which are usually impressed upon the beginner, three have been selected for constant reiteration: "Keep your eye on the ball," "Don't press," and "Swing slowly back." To these is sometimes added

an injunction which finds a ready echo in the hearts of all who are responsible for the maintenance and care of golf-links; namely, "Never, when you have cut out a portion of turf in the act of playing, omit to replace it." Finally, the present humble writer would venture to throw in, as a fifth admonition: "Don't

drive at a fellow-creature, so long as there is a reasonable chance of your hitting him."

May all who shall have had the patience to read these remarks have the patience likewise to act upon the sage precepts contained in the foregoing paragraph! So shall they develop into good golfers, live long, and prosper.

*W. E. Norris.*

## THE NATURE AND ELEMENTS OF POETRY.

### VI. TRUTH.

F all natural things make for beauty,—if the statement is well founded that they are as beautiful as they can be under their conditions,—then truth and beauty, in the last reduction, are equivalent terms, and beauty is the unveiled shining countenance of truth. But a given truth, to be beautiful, must be complete. Tennyson's line,

A lie which is half a truth is ever the blackest of lies,

will bear inversion. Truth which is half a lie is intolerable. A certain kind of preaching, antipathetic to the spirit of poesy, has received the name of didacticism. Instinct tells us that it is a heresy in any form of art. Yet many persons, after being assured by Keats that the unity of beauty and truth is all we know or need to know, are perplexed to find sententious statements of undisputed facts so commonplace and odious. Note, meanwhile, that Keats's assertion illustrates itself by injuring the otherwise perfect poem which contains it. So obtrusive a moral lesson the effect of the "Ode on a Grecian Urn." In other words, the beauty of the poem would be truer without it. Now, why does a bit of didacticism take the life out of song, and didactic verse proclaim its maker a prosier and not a poet? Because pedagogic formulas of truth do not convey its essence. They preach, as I have said elsewhere, the gospel of half-truths, uttered by those who have not the insight to perceive the soul of truth, the expression of which is always beauty. This soul is found in the relations of things to the universal, and its correct expression is beautiful and inspiring.

While the beautiful expresses all these relations, the didactic at the best is the expression of one or more of them,—often of arbitrary

and temporal, not of essential and infinite, relations. We therefore detest didactic verse, because, though made by well-intentioned people, it is tediously incomplete and false.

POETS will interpret nature truthfully, within their liberties; they do not assume to be on as close terms with her, or with her Creator, as some of the teachers and preachers. They are content to find the grass yet bent where she has passed, the bough still swaying which she brushed against. They feel that

What Nature for her poets hides  
'T is wiser to divine than clutch.

The imaginative poets, who read without effort the truth of things, have been more faithful in even their passing transcripts of nature and life than many who conscientiously attempt a portrayal. Where they make comments, it is as if by anticipation of the reader; it is not so much their own conclusion as that of the observing world. The truth, moreover, is less in the comment than in the poetry,—is rather in the song than in the obligato. With the epic or dramatic poet the motive is not truth of description, but truth of life. Yet how much surer the scenic touches of the best narrative and drama than the word-painting of the so-called descriptive poets! Compare the sudden landscape, the life of its populous under-world, the sky and water, the sunlight and moonlight and storm, in "A Winter's Tale" and "Midsummer Night's Dream," with the prolonged and pious descriptions in Thomson's "Seasons." In the dramas the scenic truth is incidental, yet almost incomparable for beauty; in the descriptive poem it is elaborate and tame. You are comparing, to be sure, the greatest of poets with one relatively humble, but the latter is on his chosen ground, and gives his whole mind to his business. Something more than sincerity

and knowledge, then, is needed for the expression of truth. Superadd noble contemplation and the anointed vision that reads the life of nature, and you have Wordsworth, a poet and painter indeed. In his greater moods he assuredly sets us face to face with unadulterate truth. Even Wordsworth does this less effectively, by his premeditated interpretation, than certain bards whose side-glimpses of the outdoor world we interpret for ourselves. Their chance strokes are matchless. The classic isles and waters are all before us in the "Odyssey," characterized broadly and truthfully by essential traits. Attica glows and glooms in the choruses of "Cedipus at Colonus" and "The Clouds"; we have the atmosphere that suffuses her landscape, action, personages. Its tone is just as capturable now, as two thousand years ago under the sky of Sophocles and Aristophanes. The phonograph passes no more intelligibly to after time the living voice of a Gladstone or a Browning. Rarely is there an avowedly descriptive poet who achieves much more than the asking you to take his word for a mass of details. To come near home, this was what such American landscapists as Street and Percival usually succeeded in doing; while Lowell, with his quick eye and Greek good-fellowship with nature, always keeps us in mind of her as a blithe companion by his side when he chats to us, and whether on the rocks of Appledore, or under the willows, or along the snow-paths of a white New England night. Cowper got nearer to truth than Thomson; he pointed to the naturalness that Wordsworth sought in turn — and found. As for Burns, he lay in nature's heart, and — whether with or without design — expressed her as simply and surely as the bards of old.

Of both truth to life and truth to physical nature there are two poetic exhibits: the first, broad; the second, minute and analytic. The greater the poet, the simpler and larger his statement, however fine in detail when need be. Seeking that presentment of human character and experience which is universal, we go to the poets and idyls of the Bible, to Homer and the Attic dramatists, to Cervantes and Shakspeare, to Molière, and to the great novelists of the modern age. In poetry life has never been treated at once with so much intensity and truth, by many contemporaries, as in the Elizabethan period. This was inevitable. Our early dramatists wrote for instant stage production; their poetic text was of much import in default of the perfected acting and accessories which now render the text less essential — in fact, far too subordinate. In such "effects" as the stage production then made practicable, Shakspeare and his group have not been excelled. But life

— truth of life and character — then was all in all; a false transcript was instantly detected; the dramatic poet, however exuberant, founded his work in unflinching realism. Situations and trivial sentiment now make the playwright, and even Tennyson and Browning have been unable to restore the muse conspicuously to the stage. The laureate's genius, to be sure, is the reverse of dramatic. Browning had the requisite passion and dramatic instinct; life and motive engrossed him beyond all else. But contrast the bold, direct Elizabethan characters with Browning's personages — whose thought and action are analyzed by him to the remotest detail. His drama is unique, but not in the free and instant spirit of poetry; it is not so much life as biology. The distinction recalls that tradition of the Massachusetts bar. Webster and Choate often were opposed in leading cases. The former brought his power and learning to bear upon the main issue of a case, and brushed aside the inessentials. Choate delighted to follow every trail to the uttermost, and in a manner as analytic as that of "The Ring and the Book." The jurors marveled at Choate's intellectual dexterity and glitter, but Webster usually won the verdict. The jury of an author is the reading world. In prose romance America puts forward a counterpart to Browning — Mr. Henry James, except that he never sacrifices an imperturbable refinement of style; besides, with reference to his novels at least, he usually avoids, as if on principle, the concentrated passion and the dramatic situations that at times make Browning so impressive.

On the other hand, when Browning, the anatomist of human life, interests himself with side-glimpses of nature, he is full of simple truth, and with a sure instinct for essentials. His lyrics abound in these beautiful surprises. He forgets the laboratory when he touches landscape and outdoor life, and is all the artist. Nature has but one truer painter among the dramatists, and the best touches of both seem incidental. When Browning thinks of birds and beasts they suddenly, as in the Arabian Nights, become almost human. He reads the heart, one might say, of a bird, a horse, or a dog. This Tennyson does not do, nor does he usually give us vivid personal characters, admirably as he draws conventional types. His truth to nature is positive; he has the eye of a Thoreau, and the pastoral fidelity which befits one who is not only the pupil of Milton and Keats, but of Theocritus and Wordsworth. He can treat broadly, and imaginatively withal, "the league-long roller thundering on the reef" and "the long wash of Australasian seas"; but his frequent over-elaboration led the way to a main fault of the younger schools.

While a poet cannot be too accurate, his

method, to be natural, must seem unconscious. The virtue of a truth is spoiled by showing it off. Tennyson, the idylist, pauses at critical moments, not perhaps to moralize on the situation, but to make a picture suggesting the feeling which the action itself ought to convey. This practice, for a time so fascinating, has been carried to extremes. Now, in a class of his poems of which "Dora" is a fine example, he has shown that nothing can be more effective than a story simply told. A direct statement, through its truth, often has exceeding beauty—the beauty, pathetic or otherwise, of perfect naturalness. You find it everywhere in the Scriptures; for example:

I shall go to him, but he shall not return to me;  
and everywhere in Homer:

A thousand fires burned in the plain, and by the  
side of each sate fifty in the gleam of blazing fire.

A deep sleep fell upon his eyelids, a sound sleep,  
very sweet, and most akin to death.

All genuine epics and ballads are charged with  
it, as in "The Children in the Wood":

No burial this pretty pair  
Of any man receives,  
Till Robin-redbreast piously  
Did cover them with leaves.

In the heroic vein, Arnold's "Sohrab and Rustum" has a primitive directness:

So said he, and his voice released the heart  
Of Rustum; and his tears broke forth; he cast  
His arms around his son's neck, and wept aloud,  
And kissed him. And awe fell on both the hosts  
When they saw Rustum's grief.

The finest touch in Lady Barnard's ballad is  
the simplest—that of the line,

For auld Robin Gray is kind unto me.

But I need not multiply such examples of the  
beauty of direct statement of unsophisticated  
truth. It is too rare a grace among the ana-  
lytic and decorative poets.

WHEN we come to the reflective poetry of  
nature, the broad effects of Wordsworth and  
Bryant are both true and imaginative, and  
therefore excellent realism. For Nature does  
not differentiate her beauties; she combines  
them. It is hard to better the truth "by her  
own sweet and cunning hand put on." Bryant's  
successors—Whittier, Lowell, Whitman,  
Lanier, Taylor—have great fidelity to  
Nature. How can they help it, brought up in  
her own realm? Their touches are sponta-

neous, and that is everything. A city-bred poet  
is apt to strike false notes as soon as he hints  
at an intimacy with nature, and a false note is  
as quickly detected in poetry as in music, even  
by those who cannot sound the true one. As  
for truth to life—that depends on the poet's  
sympathetic perception. It was native to  
Burns; it was impossible with the self-absorbed  
Byron. Most poets, whether cockney or rustic,  
can draw only the types under their direct  
observation. Whitman's out-of-door poetry  
should be familiar to you. His admirers,  
including very authoritative judges at home  
and abroad, make almost every claim for him  
except that to which, in my opinion, he is en-  
titled above other American poets. I know no  
other who surpasses him as a word-painter of  
nature. His eye is keen, his touch is accurate.  
No one depicts the American sky, ocean,  
forest, prairie, more characteristically or with  
a freer sense of atmosphere; no one is so inclu-  
sive of every object, living or inanimate, in the  
zones covered by our native land. His defects  
lie in his theory of unvarying realism. Nature's  
poet must adopt her own method; and she  
hides the processes that are unpleasant to see  
or consider. Whitman often dwells upon the  
under side of things, the decay, the ferment,  
the germination, which nature conducts in  
secret, though out of them she produces new  
life and beauty. Lanier, with equal fidelity,  
avoids—a refined and spiritual genius needs  
must avoid—this irritating mistake. His taste  
made him an open critic of the robust poet of  
democracy: but it is manifest that the two (as  
near and as different as Valentine and Orson)  
were moving in the same direction; that is,  
for an escape from conventional trammels to  
something free, from hackneyed time-beats to  
an assimilation of nature's larger rhythm—to  
limitless harmonies suggested by the voices of  
her winds and the diapason of her ocean bil-  
lows. The later portion of Whitman's life-work,  
his symphonies of "starry night," of death  
and immortality, have chords that would have  
thrilled Lanier profoundly.

In certain poems which have been humor-  
ously compared to "catalogues," Whitman  
supplies an example of the uselessness of a dis-  
play of mere facts. Facts, despite Carlyle's eu-  
logy upon them, are not "the one" and only  
"pabulum." They are the stones heaped about  
the mouth of the well in whose depth truth  
reflects the sky. I recall the words of Sir Wil-  
liam Davenant, who wrote the feeblest of epics  
on a theory, yet preluded it with a chapter  
of noble prose wherein, among other fine dis-  
criminations, he says: "Truth, narrative and  
past, is the idol of historians (who worship a  
dead thing), and truth, operative and by its ef-  
fects continually alive, is the mistress of poets,

who hath not her existence in matter but in reason." Realism, in the sense of naturalism, is the firm ground of art, but the poet is not a realist merely as concerns the things that are seen. He draws these as they are, but as they are or may be at their best. This lifts them out of the common, or, rather, it is thus we get at the "power and mystery of common things." His most audacious imaginings are within the felt possibilities of nature. But the use of poetry is to make us believe also in the impossible. Raphael said that he painted "that which ought to be." And Browning writes:

In the hall, six steps from us,  
One sees the twenty pictures — there 's a life  
Better than life — and yet no life at all.

Lord Tennyson is reported as saying, with respect to certain contemporary writers: "Truth, as they understand it, is not the essential thing in poetry. For me verses have no other aim than to call to life nobler and better sentiments than we feel and express in every-day life. If they can suggest pictures worthy of an artist's eye, so much the better." Even the first English writer upon the topic — George Puttenham, whose "Arte of English Poesie" was published anonymously in the year 1589 — said that "Arte is not only an aide and coadjutor to nature in all her actions, but an alterer of them, so as by means of it her owne effects shall appear more beautiful or straunge and miraculous." And so there is nothing more lifeless, because nothing is more devoid of feeling and suggested movement, than servilely accurate imitation of nature. In every art a certain deviation from fact is not only justifiable, but required. Some things must be told or painted not as they are, but as they affect the eye or the imagination. The photograph reveals, indeed, the absolute position of the horse's legs at a given instant; by its aid the spokes of the revolving wheel are defined. Without doubt, art has learned most important facts through the photographic demonstration of actual processes; our animal- and figure-painters, our sculptors, can never repeat the absurd untruths which have become almost academic in the past. They will not, and need not, however, go to the other extreme. To the human eye, with its halting susceptibilities, the horse and the wheel do not appear exactly as when caught by Mr. Muybridge's camera, and the artist's office is to present them as they seem to us. In the prosaic photograph they are struck with death: the idea of life, of motion, can only be conveyed by blending the spokes of the wheel as they are blended to the human vision, and by giving a certain unreality of grace to the speeding animal. Otherwise, you have the fact, which is not art.

Thus every workman must be a realist in knowledge, an idealist for interpretation, and the antagonism between realists and romancers is a forced one; and when any one rules the poet out of debate, as of course a feigner, he is in error, for the same law applies to all the arts. The true inquiry concerns the quality of the writer, his power of expression, the limits of his character. For no small and limited nature can enter into great passions and experiences.

It is a fine thing for a poet to express the life, feeling, ideal, of his own people; by so doing, he betters his chance of commending himself to after times. This is what the Greeks did, but in our century we find poet after poet exercising his skill upon reproductions, working the Grecian myths and legends over and over again in pseudo-classical lyrics, idyls, and dramas. After Landor and Keats and Tennyson and Swinburne, our younger school cannot find a real need for this sort of thing. I remember my own chagrin, twenty years ago, when Mr. Lowell wrote a most judicious notice of one of my books, and failed to mention a blank-verse poem, with a classical theme, upon which I had expended the technical skill and imagery at my command. On the other hand, he was more than kind to my native, if homely, American lyrics and ballads, written with less pains, yet more spontaneously; and he told me very frankly that he thought the simple home-fruit of more real significance than my attempt to reproduce some apple of the Hesperides. He was right, and I have not forgotten the lesson. With respect to another art, I wonder that the American sculptor does not still more frequently make a diversion from his imitations of the mediæval and the antique. What subjects he has close at hand — such as a Greek, if he now could chance upon them, would handle with eagerness and truth! Surely our American workman, at labor and in repose, our young athletes, our beasts of the forest and of the field, are available models; and Ward's "Indian Hunter," Donoghue's "The Boxer," and Tilden's "The Ball-Thrower," at least convey their suggestion of what should and will be done. There is a certain lack of sincerity, despite their artistic beauty, in the foreign and antique exploits of many poets and artists; and lack of sincerity is always lack of truth. But, while they should favor their own time, they must avoid expression of its transient passions and characteristics. Seize upon the essential, lasting traits, and let the others be accessory. If the general spirit of the time be not embodied, a work is soon out of date. Against all this, the widest freedom is permitted to that chartered libertine — the poet's im-

agination. Nature and the soul being the same forever, we care nothing for Shakspeare's anachronisms and impossible geography; we find nothing strange and impossible in his assembly of mediæval fays and antique heroes and amazons, of English clowns and mechanics in Grecian garb, all commingled to enact a fantastic marvel of comedy and poesy in the palace and forests of a "Midsummer Night's Dream." We confess the poet's witchcraft, and ourselves are of the blithe company—denizens of an enchanted land, where everything has the truth of possibility. A conception is not vitiated by the most novel form it may assume, provided that this be artistic and not artificial. For art, as Goethe and Haydon have said, is art because it is not nature. That method is most true which, invoking the force of nature, directs it by its own device; just as, in mechanics, the screw-propeller is more than the equivalent of the fish's flukes or the bird's wing. Our delight in art proceeds from a knowledge that it is not inevitable, but designed; a human, not a natural, creation; the truth of nature's capabilities, seen by man's imagination, captured by the human hand, expressed and illumined when our Creator, intrusting his own wand to us, bids us test its power ourselves.

WHAT is called descriptive poetry never can be very satisfying, since the painter is so much more capable than the poet of transferring the visible effects of nature—those addressed to the eye. I suppose it is impossible for one not reared in England, and in that very part of England which lies between Derwentwater and the Wye, to comprehend thoroughly the truth and beauty of Wordsworth's pastoral note and landscape. Neither can a foreigner rightly estimate the American idyls; the New World scenery and atmosphere are so different from the European that they must be seen before their quality can be felt. Aside from this limitation, the poet expresses what he finds in nature, to wit, that which answers to his own needs and temper. Her interpretation has been, it may almost be said, a special function of the century now closing. Nature moved Coleridge to eloquence, rhapsody, worship, and, as an artist, to imaginative mysticism. Heine, Longfellow, Swinburne, have read the secret of the sea. To Landor, Emerson, and Lowell the tree is animate; in their presence the flower has rights: they would not fell the one nor pluck the other. But there were two English poets whose respective temperaments answered perfectly to the two conditions of nature embraced in Lord Bacon's profound observation, that "In nature things move violently to their place and calmly in their place." Byron's fitful genius was stirred by her violence of change. The

rolling surges, the tempest, the live thunder leaping from peak to peak, mated the restlessness of a spirit charged with their own intensity of motion and desire. Wordsworth felt the sublimity of the repose that lies on every height, of nature's ultimate subjection to law. His imagination comprehended her reserved forces; and before his time her deepest voice had no apt interpreter, for none had listened with an ear so patient as his for mastery of her language. His announcement that

He who feels contempt  
For any living thing, hath faculties  
Which he has never used,

was like a revelation. That he had purged himself of all such baseness was his absolute conviction: in such matters he was a kind of Gladstone among the poets of his day. Therefore self-contemplation, or, to be more exact, the transcription of nature's effect upon himself, seemed to him a sane, even a sacred, vocation. In fact, a lofty, if not inventive, imagination, and

An eye made quiet by the power of harmony,

gave him for this faith a warrant which all his ponderous homiletics could not render null. As he let "the misty mountain winds" blow on him, he was nature's living oracle. And the world soon yielded to the force of that "pathetic fallacy" which has imparted to modern thought a distemper and a compensation: the refuge, be it real or illusionary, still left to us, and so compulsive that neither reason nor science can quite rid us of it when face to face with nature—when soothed by the sweet influences of our mother Earth. It is true, in Landor's words, that

We are what suns and winds and waters make us;  
The mountains are our sponsors, and the rills  
Fashion and win their nursing with their  
smiles.

But Ruskin avers that the illusion under which we fondly believe nature to be the sympathetic participator of our sentiment or passion, and which he terms the pathetic fallacy, is incompatible with a clear-seeing acceptance of the truth of things.

Now, that there is a solace—a companionship—found in nature none can doubt. It is as old as the fable of Antæus. Primitive races feel it so strongly that they inform all natural objects with sentient individual lives; our more advanced intelligence conceives of a universal spirit that comprehends and soothes Earth's children. In our own youth, nature haunts us "like a passion": and as in the youth of a race, we "cannot paint what then we were," in mature years each of us can say,

And I have felt  
 A presence that disturbs me with the joy  
 Of elevated thoughts; a sense sublime  
 Of something far more deeply interfused,  
 Whose dwelling is the light of setting suns,  
 And the round ocean and the living air,  
 And the blue sky, and in the mind of man.  
 A motion and a spirit, that impels  
 All thinking things, all objects of all thought,  
 And rolls through all things.

This has never been expressed so well as in Wordsworth's elevated phrases. They must always be cited. But a disenchantment is at last upon us, and we are sternly questioning our reason. Is not nature's apparent sympathy, we ask, a purely subjective illusion? The old belief, the new doubt, are well conveyed in the early and later treatment of a favorite theme—the moaning of a sea-shell held to the ear. In Landor's "Gebir" we have it thus:

But I have sinuous shells of pearly hue;

Shake one and it awakens, then apply  
 Its polished lips to your attentive ear,  
 And it remembers its august abodes  
 And murmurs as the ocean murmurs there.

Landor complained that Wordsworth stole his shell, and "pounded and flattened it in his marsh" of "The Excursion":

I have seen  
 A curious child, who dwelt upon a tract  
 Of inland ground, applying to his ear  
 The convolutions of a smooth-lipped shell;  
 To which, in silence hushed, his very soul  
 Listened intensely; and his countenance soon  
 Brightened with joy; for from within were heard  
 Murmurings, whereby the monitor expressed  
 Mysterious union with its native sea.

Byron acknowledged his obligations to "Gebir" for his lines in "The Island," beginning,

The Ocean scarce spake louder with his swell,  
 Than breathes his mimic murmurer in the shell.

And now, as we near the close of the century which "Gebir" initiated, Eugene Lee-Hamilton devotes one of his remarkable sonnets to this same murmur of the shell, and I cannot find a more poetic, more impassioned recognition of the veil which modern doubt is drawing between our saddened eyes and the beautiful pathetic fallacy:

The hollow sea-shell which for years hath stood  
 On dusty shelves, when held against the ear  
 Proclaims its stormy parent; and we hear  
 The faint far murmur of the breaking flood.  
 We hear the sea. The sea? It is the blood  
 In our own veins, impetuous and near,  
 And pulses keeping pace with hope and fear  
 And with our feelings' ever-shifting mood.

Lo! in my heart I hear, as in a shell,  
 The murmur of a world beyond the grave,  
 Distinct, distinct, though faint and far it be.  
 Thou fool! this echo is a cheat as well,—  
 The hum of earthly instincts; and we crave  
 A world unreal as the shell-heard sea.

How beautiful this ecstasy of disenchantment—beautiful in its sad sincerity,—and yet how piteous! Here is a fine spirit, for the moment baffled, heroically demanding the truth, the truth. More trustfully leaving the future to "the Power that makes for good," Lowell also confronts the scientific analysis of our attitude toward nature:

What we call Nature, all outside ourselves,  
 Is but our own conceit of what we see,  
 Our own reaction upon what we feel;  
 The world's a woman to our shifting mood,  
 Feeling with us, or making due pretense;  
 And therefore we the more persuade ourselves  
 To make all things our thoughts' confederates,  
 Conniving with us in whate'er we dream.

The poet, to be aware of this, must have drifted quite away from the antique point of view. The Greek certainly made nature populous with dryads, oreads, naiads, and all the daughters of Nereus; but these had a joy and, like Jaques, a melancholy of their own, not those of common mortals. Doubtless the Greek felt the charm of the hour when twilight descended on his valley, but not the pensive suggestions of the Whence and Whither which it excites in you and me. "No young man," said Hazlitt, "ever thinks he shall die." He recognizes death, but it concerns him not. The Greek accepted it as a natural process; he yielded to nature; we adjure her, as Manfred adjured his spirits, and fain would compel her to our service and demand her to surrender the eternal secret.

Nature, even in her most tranquil mood, is palpitant with motion, in view of which Humboldt was at times a poet. Motion is life, and therefore fellowship. Herein lies the spell of the sea, which has mastered Heine and Shelley and every poetic soul. Its perpetual change, eternal endurance—these image both life and immortality; its far-away vessels moving to unknown climes, its unbounded horizon suggesting infinity, buoy the imagination, and thence come human passion and thoughts "too deep for tears." We have conquered it, and it is the modern poet's comrade, as it was the ancient's fear and marvel. But what is the sea? Tennyson's "still salt pool, lock'd in with bars of sand," would be an ocean to a man reduced to insect size—a stretch of water, infused with salt, and roughened into wavelets by the air that moves across it. We have learned that the effect of the sea, of a prairie,

of a mountain, is purely relative. One of the latest "Atlantic" novelists, with youth's contemporaneousness, realizes both the fact and the dream. Her lovers are watching "a big, red, distorted moon above the illimitable palpitating waste" of the ocean:

"A waning moon is so melancholy," said Felicia, looking at it with wide, soft eyes that had grown melancholy, too. "I wonder why?"

"I don't see that it is melancholy," Grafton declared.

"No, I suppose not," she rejoined. "I dare say you see a planet which suggests to you apogee, or perigee, or something wise. I see only the rising moon, and it seems to me particularly ominous to-night. I am afraid. Something unexpected—perhaps something terrible—is going to happen."

You will note, by the way, that our débutante is scientifically accurate upon a matter in respect to which many a good writer has gone wrong. She sees the moon where it should be of an evening in its third quarter—to wit, rising in the east. Giving the author of "Felicia" credit for this unusual feat, I believe that reason never can greatly lessen the influence of nature upon our feelings, and this in spite of her stolid indifference, her want of compassion, her stern laws, her unfairness, unreason, and general unmorality. To the last, man will be awed by the ocean and saddened by the waning moon, and will find the sun-kissed waves sparkling with his joy, and the stars of even looking down upon his love. One may conceive, moreover, that before a vast and various landscape we are affected by the very presence of divinity revealed only in his works; that, face to face with such an expanse of nature, we recognize more of a pervading spirit than when more closely pent: as in a house of worship, with a host of others like ourselves, we have more of him incarnate in humanity; whence comes a strange elevation, and at times almost a yearning to be reabsorbed in the infinite being from which our individual life has sprung.

The aspect and sentiment of nature, more than other incentives to mental elevation, have supplied a motive to the artistic expression of the last half-century. In the domains of the painter and the poet, and on both sides of the Atlantic, the idealization of nature has been, as never before, supreme. Never has she been portrayed on canvas as by Turner and his successors; never has she received such homage in song as that of the English and American poets from the time of Wordsworth. Two significant advantages confirmed Wordsworth's influence: first, that of longevity, which, in spite of the ancient proverb, is the best gift of the gods to an originative leader; second,

the fact that, with brief exceptions, he made verse his only form of expression. No wonder that he produced an "ampler body" of good poetry—and of prosaic verse as well—than "Burns, or Keats, or Manzoni, or Heine." But in this country also the force of nature has been sovereign, since Bryant first gave voice to the spirit of the glorious forest and waters of a relatively primeval land. During an idyllic yet speculative period, the maxim that "the proper study of mankind is man" has for many reasons been almost in abeyance. At last it is again evident that we cannot live by bread alone, even at the hands of the great mother. There is a longing and a need for emotion excited by action and life, for a more impassioned and dramatic mode—that of a figure-school, so to speak, in both poesy and art. Not to "fresh woods and pastures new," but to human life with its throes and passions and activity, must the coming poet look for the inspirations that will establish his name and fame.

IN my censure of didacticism I used that word in the usually adopted sense. Its radical meaning is not to be dismissed so lightly. If there is a base didacticism false to beauty and essentially commonplace, there is a nobly philosophic strain which I may call the poetry of wisdom. There is an imagination of the intellect, and its utterance is of a very high order—often the prophecy of inspiration itself.

Were this not so, we should have to reverse time's judgment of intellectually poetic masterpieces from which have been derived the wisdom and the rubrics of many lands. Shall we rule out the lofty voice of the preacher, whose lesson that all save the fear of God is vanity has been reaffirmed by a cloud of witnesses, down to the chief of imaginative homilists in our own time? Whether prose or verse, I know nothing grander than "Ecclesiastes" in its impassioned survey of mortal pain and pleasure, its estimate of failure and success; none of more noble sadness; no poem working more indomitably for spiritual illumination. Shall we rule out the elegies of Theognis or the mystic speculations of Empedocles, celebrant of the golden age and declarer of the unapproachable God? And who would lay rude hands upon the poet who concerned himself with the universe, surpassing all other Latins in intellectual passion and dignity of theme? The rugged "De Rerum Natura" of Lucretius seems to me as much greater than the "Æneid" as fate and nature are greater than the world known in that day. Whether his science was false or true,—and meanwhile you know that the atomic theory is once more in vogue,—he essayed "no middle flight," but

soared upon the philosophy of Epicurus to proclaim the very nature of things; meditating which, as he declared, the terrors of the mind were dispelled, the walls of the world parted asunder, and he saw things "in operation throughout the whole void." What shall we do with Omar Khayyám, at least with that unique paraphrase of his "Rubáiyát" which has impressed the rarest spirits of our day, and has so inspired the wondrous pencil of Elihu Vedder, our American Blake? And what of "In Memoriam"? The flower of Tennyson's prime is distinctly also the representative Victorian poem. It transmits the most characteristic religious thought of our intellectual leaders at the date of its production. We have no modern work more profound in feeling, more chaste in beauty, and none so rich with the imaginative philosophy of the higher didacticism. Browning's precepts, ratiocination, morals, are usually the weightier matters of his law. Take from Emerson and Lowell their sage distinctions, their woof of shrewdest wisdom, and you find these so closely interwoven with their warp of beauty that the cloth of gold will be ruined. Like Pope and Tennyson, they have the gift of "saying things," and in such wise that they add to the precious currency of English discourse.

The mention of Pope reminds me that he is the traditional exemplar of the didactic heresy, so much so that the question is still mooted whether he was a poet at all. As to this, one can give only his own impression, and my adverse view has somewhat changed—possibly because we grow more sententious with advancing years. Considering the man with his time, I think Pope was a poet: one whose wit and reason exceeded his lyrical feeling, but still a poet of no mean degree. Assuredly he was a force in his century, and one not even then wholly spent. It seems to me that his didacticism was inherent in the stiff, vicious, Gallic drum-beat of his artificial style—so falsely called "classical," so opposed to the true and live method of the antique—rather than in his genius and quality. Looking at the man, Pope, that fiery, heroic little figure, that vital, electric spirit pitiably encaged,—defying and conquering his foes, loving, hating, questioning, worshiping,—I see the poet. I had hoped to say more of him while upon this subject of the didactic, but, fortunately for your patience, the limits of a lecture are inexorable. However, if you care to see how much more difference there is in the methods than in the poetic gifts of certain bards, amuse yourselves by translating Pope, Tennyson, Emerson, Browning, into one another's measures and styles, and you will find the result suggestive.

Three, at least, of these poets have at times

a delicious humor and fancy, as in "The Rape of the Lock," "The Talking Oak," "Will Waterproof's Lyrical Monologue," "The Pied Piper," etc. Humor, in the sense of fun, is doubtless another lyrical heresy. But humor is the overflow of genius,—the humor compounded of mirth and pathos, of smiles and tears,—and in the poems cited, and in Thackeray's ballads, it speaks for the universality of the poet's range. While certain notes in excess are fatal to song, in due subordination they supply a needful relief, and act as a fillip to the zest of the listener.

THE highest wisdom—that of ethics—seems closely affiliated with poetic truth. A prosaic moral is injurious to virtue, by making it repulsive. The moment goodness becomes tedious and unideal in a work of art, it is not real goodness; the would-be artist, though a very saint, has mistaken his form of expression. On the other hand, extreme beauty and power in a poem or picture always carry a moral: they are inseparable from a certain ethical standard; while vice suggests a depravity. Affected conviction, affection of any kind, and even sincere conviction inartistically set forth, are vices in themselves—are antagonistic to truth. But the cleverest work, if openly vicious, has no lasting force. A meretricious play, after the first rush of the baser sort, is soon performed to empty boxes. Managers know this to be so, and what is the secret of it? Simply, that to cater to a sensual taste incessant novelty is required. Vice admits of no repose; its votary goes restlessly from one pleasure to another. Thus no form of vicious art bears much repetition: it satiates without satisfying; besides, any one who cares for art at all has some sort of a moral standard. He violates it himself, but does not care to see it violated in art as if upon principle.

An obtrusive moral in poetic form is a fraud on its face, and outlawed of art. But that all great poetry is essentially ethical is plain from any consideration of Homer, Dante, and the best dramatists and lyrists, old and new. Even Omar, in proud recognition of the immutability of the higher powers, chants a song without fear if without hope. The pagan Lucretius, confronting sublimity, found no cause to fear either the gods or the death that waits for all things. A glimpse of the knowledge which is divine, an approach to the infinite which makes us confess that "an undevout astronomer is mad," inspire the "De Rerum Natura." The poet sat in the darkness before dawn. He would report no vision which he did not see. Like Fitzgerald's Omar he seems to confess, with the epicureanism that after all is but inverted stoicism, and with unflinching truth:

Up from Earth's Centre through the Seventh Gate

I rose, and on the Throne of Saturn sate,  
And many a Knot unravell'd by the Road;  
And not the Master-knot of Human Fate.

Poetry, in short, as an ethical force, may be either iconoclastic or constructive, nor dare I say that the latter attribute is the greater, for the site must be cleared before a new edifice can be raised. Herein consists the moral integrity of Lucretius and Omar. They rebelled against the superstitions of their periods. Better a self-respecting confession of ignorance, a waiting for some voice from out the void, than a bowing down to stone images or reverence for a false prophet. Critics are still to be found who look upon a modern poet—in his lifetime almost an outlaw—as a splendid lyrical genius gone far astray. Of course I refer to Shelley. The world is slowly learning that Shelley's office was ethical. As an iconoclast, he rebelled against tyranny and dogma. His mistakes were those of poetic youth and temperament, and he grew in love, justice, pity, according to his light. He groped in search of some basis for construction, but died in what was still his formative period. Yet we see sage and elderly moralists applying to Shelley the tests of their own mature years and modern enlightenment, and holding a sensitive and passionate youth to account as if he were an aged philosopher. Even Matthew Arnold, despite his fine recognition of that transcendent lyrist, did not quite avoid this attitude. Professor Shairp assumed it altogether. With respect to the poetry of nature, I can refer you to no more suggestive critic, for he was a Wordsworthian, and all his discourse leads up to Wordsworth as the greatest, because the most contemplative, of nineteenth-century poets. Otherwise he was an extreme type of the class which Arnold had in mind when he said, "We must be on our guard against the Wordsworthians, if we want to secure for Wordsworth his due rank as a poet." His utter failure to see the force of a blind revolt like Shelley's, in the evolution of an ultimately high morality, was inexcusable. A more striking example of faulty criticism could hardly be given. Shelley is not to be measured by his conduct of life nor by his experimental theories, but rather, as Browning estimates him, with every allowance for his conditions and by his highest faculty and attainment.

BUT the most thoughtful and extended of mythical productions in the purely didactic method is of less worth, taken as poetry, than any lyrical trifle—an English song or Irish lilt, it may be—that is spontaneous and has quality. The disguises of the commonplace are endless; we are always meeting the old foe with a

new face. A fashionable diction, tact, taste, the thought and manner of the season, set them off bravely; but they soon will be flown with the birds of last year's nests. Of such are not the works whose wisdom is imaginative, whether the result of intuition or reflection or of both combined. These "large utterances" of intellectual and moral truth show that nothing is impossible, no domain is forbidden, to the poet, that no thought or fact is incapable of ideal treatment. The bard may proudly forego the office of the lecturer, such as that exercised in this discourse, which is by intention didactic and plainly inferior to any fine example of the art to which its comment is devoted. Yet the new learning doubtless will inspire more of our expression in the near future, since never was man so apt in translation of nature's oracles, and so royally vouchsafed the freedom of her laboratory, as in this age of physical investigation. Accepting the omen, we make, I say, another claim for the absolute liberty of art. Like *Gaspar Becerra*, the artist must work out his vision in the fabric nearest at hand. His theme, his method, shall be his own: always with the passion for beauty, always with an instinct for right. No effort to change the natural bent of genius was ever quite successful, though such an effort often has spoiled a poet altogether.

This brave freedom alone can breed in a poet the catholicity which justifies Keats's phrase, and insures for his work the fit coherence of beauty and truth. The lover of beauty, in Emerson's "Each and All," marvels at the delicate shells upon the shore:

The bubbles of the latest wave  
Fresh pearls to their enamel gave;

I wiped away the weeds and foam,  
I fetched my sea-born treasures home;  
But the poor, unsightly, noisome things  
Had left their beauty on the shore,  
With the sun, and the sand, and the wild uproar.

Disappointed, he forswears the pursuit of beauty, and declares:

—I covet truth;  
Beauty is unripe childhood's cheat;  
I leave it behind with the games of youth.

But, even as he speaks, the ground-pine curls its pretty wreath beneath his feet, "running over the club-moss burrs"; he scents the violet's breath, and therewithal

Over me soared the eternal sky,  
Full of light and deity;

Beauty through my senses stole;  
I yielded myself to the perfect whole.

This recognition, at which the idealist arrives, of the intertransmutations of beauty and truth,

is a kind of natural piety, and renders the labor of the poet or other "artist of the beautiful" a proper form of worship. His heart tells him that this is so: it is lightest when he has worked at his craft with diligence and accomplishment; it is light with a happiness which the religious say one can know only by experience. The piety of his labor is not yet sufficiently comprehended; even the poet, having listened all his life to other tests of sanctification, often mistrusts his own conscience, looks upon himself as out of the fold, and is sure only that he must "gang his ain gait," however much he suffers for it in this world or some other.

Thus a dividing line has been drawn from time immemorial betwixt the conventional and the natural worshipers, betwixt the stately kingdom of Philistia and the wilding vales and copses of that Arcadia which some geographers have named Bohemia. The mistake of the Arcadian is that he virtually accepts a standard not of his own establishment; he is impressed by a traditional conception of his Maker, regards it as fixed, will have none of it, and sheers off defiantly. If rich and his own master, he becomes a pagan virtuoso. If one of the struggling children of art and toil, then,

Loving Beauty, and by chance  
Too poor to make her all in all,  
He spurns her half-way maintenance,  
And lets things mingle as they fall.

This is the way in Arcadia, and it has its pains and charm—as I well know, having journeyed many seasons in that happy-go-lucky land of sun and shower, and still holding a key to one of its entrance-gates. Its citizenship is not to be shaken off, even though one becomes naturalized elsewhere.

Now the artist not only has a right, but it is his duty, to indulge an anthropomorphism of his own. In his conception the divine power must be the supreme poet, the matchless artist, not only the transcendence but the immanence of all that is adorable in thought, feeling, and appearance. Grant that the Creator is the founder of rites and institutes and dignities; yet for the idealist he conceived the sunrise and moonrise, the sounds that ravish, the outlines that enchant and sway. He sets the colors upon the easel, the harp and viol are his invention, he is the model and the clay, his voice is in the story and the song. The love and the beauty of woman, the comradeship of man, the joy of student-life, the mimic life of the drama as much as the tragedy and comedy of the living world, have their sources in his nature; nor only gravity and knowledge, but also irony and wit and mirth. Arcady is a garden of his devising. As far as the poet, the artist, is creative, he becomes a sharer of the divine imagination and power, and even of the divine responsibility.

*Edmund Clarence Steadman.*

## SHELLEY'S WORK.

THE centenary of Shelley's birth will be duly observed with public ceremonies in England and Italy—the land that bore him and drove him forth, and the land that sheltered him and now guards his grave, both equally his home in the eyes of the world; but in the private thoughts of many single lives the day of his birth will be silently remembered with tenderness, with gratitude, and with a renewal of faith in the things in which he believed. Personal devotion must naturally enter into these feelings, for such days are to commemorate a life, and they bring the man back with peculiar power. To win unknown friends, age after age, is a privilege of the poet; it is his reward—the greater because it can touch him no more—for the open trust in mankind with which he confides, to whosoever will, the secret things of his spirit. Yet, to make a poet's personality the main element in his memory, if he be really great, confines his fame too narrowly. Attractive as Shelley was,

his worth did not lie wholly in his charm. Interest in his life may become degraded into ignoble curiosity, and, at the best, love's gift is less weighty than reason's award.

Recognition of noble human traits is an important part of justice done to the dead; but it is not thus that Shelley would wish to be judged. Chaucer's question, "How shall the world be served?" was the alpha and omega of his life. It inspired his youthful prose; as his faculties grew and the poet emerged from the thinker, it governed the most intense expression of his soul in manhood; it absorbed him, as he himself said, with that passion for reforming the world which was elemental in his genius. It is true that the artistic and the practical instincts in him worked together imperfectly, and that at times of despair he fell back upon himself, pure poet, pouring his heart out in lyrical effusion, with cadences of pain that fill our eyes with tears—the "idle tears," too often, of self-pity. But he took heart again, and returned, though always more wearied, to the large interests of

the race. He believed that man is the poet's muse; at the height of his aspiration, singing with the skylark, he still remembered that the poet's "unbidden hymns" are the means by which the world shall be wrought to sympathies with unheeded hopes and fears; in the depth of his dejection he still prayed that the wind might blow abroad the poet's words, "as from an unextinguished hearth ashes and sparks," to be an enkindling prophecy throughout the world — "my words among mankind." What he believed true poets are he told in a familiar passage of his prose — "the hierophants of an unapprehended inspiration; the mirrors of the gigantic shadows which futurity casts upon the present; the words which express what they understand not; the trumpets that sing to battle and feel not what they inspire; the influence which is moved not, but moves."

One hundred years have passed since he was born, and two generations have been buried since his ashes were laid by the Roman wall. It is reasonable to ask whether he had any share in this prophetic power, brooding on things to come, which is the mystical endowment of poetic genius; whether he anticipated time in those far thoughts forecasting hope, which he declared to be the substance of poetic intuition; whether he be one of those who, in his own phrase, rule our spirits from their urns, with power still vital in the chaotic thought and striving of mankind. "Poets," he said, concluding the impassioned words just quoted, "are the unacknowledged legislators of the world." If the phrase seems the mere enthusiasm of eloquence, yet so opposite a mind as Johnson's ratifies it. "He," said the old doctor concerning the poet, "must write as the interpreter of nature and the legislator of mankind, and consider himself as presiding over the thoughts and manners of future generations." To leave, then, Shelley's charm, his character, and all his private life, which the world well knows; to leave analysis and criticism, since any occasion will serve for such examination of the propriety of his moral method in poetry, and its beneficial or injurious effects upon his work, of the truth of his imagination and of its nearness or remoteness in human interest and reality, of his art, the speed and exaltation of his luminous eloquence, the piercing tone of his lyrical song — to leave such matters, I say, of merely personal or literary concern, what has the century past disclosed in regard to Shelley's sympathies with the next ages, and the vitality of his energy in the forces that advance mankind? The influences that blend in progress are many and various; the foreknowledge of the most clear-sighted is vague and doubtful, and the wisest contributes only his portion to the great result. But, this being allowed, in what sense and how

far was Shelley prophetic of the time to come, and an element in its coming?

THE spirit of discontent has been a presiding genius in literature since the reflective life of man began. The imaginative creation of ideal commonwealths marks its conquest of political thought, and the dream of the golden age its victory in poetry. So long is it since the inspiration that governed Shelley has been active in minds like his own. The "Republic" of Plato, however, and that eclogue of the young Virgil which won for him a place among the prophets of Christ, though they are the highest reach of literature in such expression, are negative; they condemn what is, by a poetic escape into a world that should be. With the rise of democracy the positive expression of discontent, in those parts of literature which reflect the life of society as distinguished from individual life, has become more direct, comprehensive, and telling. In the last century, in particular, the world was coming to a consciousness of its own misery. The state of man was never more bitterly set forth than by Swift, nor more drearily than by Johnson. Comfortable and self-satisfied as that century is often described, it was the dark soil in which the seeds of time were germinating. It ended in dry skepticism, cold rationalism, and finally in that utilitarian preoccupation of the mind which was a European mood.

The first effort toward better things, as is apt to be the case, was political. The Revolution broke. The hopefulness of that time, when in the year of Shelley's birth Wordsworth said, "T was bliss to be alive, but to be young was very heaven," is perhaps that one of its phases which is now realized with most difficulty. It reminds one of the faith of the early Church in the immediate coming of the reign of Christ on earth. When Shelley began to think and feel, and became a living soul, the first flush of dawn had gone by; but the same hopefulness sprang up in him, it was invincible, and it made him the poet of the Revolution, of which he was the child. So far as the Revolution was speculative or moral, he reflected it completely. Its commonplaces were burning truths in his heart; its ferment was his own intellectual life; its confusions, its simplicities, its misapprehensions of the laws of social change, were a part of himself. It would be wrong to ascribe the crudities of Shelley's thought merely to his immature and boyish development: they belonged quite as much to the youth of the cause; he received what he was taught in the form in which his masters held it. The ease with which genius thrives upon any food, and turns all to use, might be astonishing were it not so commonly to be observed; but its transformations

are sometimes bewildering. Like fire from heaven Shelley's genius fell upon the dry bones of rationalism, and they rose up, a spirit of beauty and of power. It was the same change that took place when philosophy went out into the streets of Paris, and in the twinkling of an eye was made a flaming mænad. It was the wand of the Revolution touching the soul of man. Shelley was, in truth, in the whirl of forces which he only half understood, vaster than he knew, with destinies dimly adumbrated in his own spirit, like the poet of his own eloquent description. The Revolution was, in Gray's phrase, "the Mighty Mother" of this child; she showed him the world-old vision of the Saturnian reign that has ever hung over Italy, yet more fair than the fairest of all our lands; she set him in the footprints of Plato; and she filled his heart with many hatreds.

The principles and remedies which Shelley adopted were of the utmost simplicity. Principles and remedies must be simple in order to be capable of wide application in the reform of society. He was not an original thinker. He had the enormous receptive and assimilative power which characterizes high genius, and he made it his function to give lofty and winning expression to the ideas that he felt to be of ennobling and beneficent power over men. He had also a strongly practical temperament; he wished to apply ideas as well as to express them, and in his own life he was always restlessly doing what he thought, linking the word with an act, carrying conviction to the extreme issue of duty performed. It was this union of the practical and speculative instincts, each highly developed, which, under the breath of his poetic nature, made his sympathies with reform so intense that he might well describe them as a passion. Yet his political, social, and religious beliefs were nothing unusual. They have been called superficial; but they were so, in the main, in no other sense than are the principles of democracy, philanthropy, and intellectual liberty. They were the simple truths whose acceptance by the world goes on so slowly. He adopted the right of private judgment, and with it the right of the individual to put his beliefs in action; the first discredited for him the excellence of the existing order, and brought him quickly into conflict with prevailing opinion; the second, in its turn, occasioned a more serious collision with that existing order itself, which met him in the form of custom, intolerance, and force. These three things he hated, because he hated most of all injustice, of which they were the triple heads. In all this he had the ordinary fortune of the revolutionist. He was face to face with the enemy. The power of custom in society, which Wordsworth had de-

scribed, "heavy as frost and deep almost as life"; the venom of intolerance, the foe against which Locke had armed him; the supremacy of force, if it be invoked, in which the long history of tyranny had instructed him — these stood in his way, and only his own indignant verse can express the violence of the hatred and contempt they excited in his breast.

What were the tenets that had so involved him in opposition to the social opinion of his own country that he went into voluntary exile? His atheism stands first because it caused his expulsion from Oxford. What was this atheism in substance? He had conceived the divine power in terms of the historic Jehovah, and its relation to man under the Christian dispensation in terms of the legal definitions of an obsolescent theology; nor can it be gainsaid that these notions coincided with the ideas then prevalent, but not realized with the same distinctness in the moral consciousness of those who held them as in Shelley's. When he began to think, this conception was antagonized in two ways. In the first instance he acquired some rudimentary metaphysics, and it became necessary to reconcile an anthropomorphic conception of deity with a philosophical definition. In the second instance he developed an ideal of goodness, and it became necessary to reconcile the divine virtue, as shown in the same historic conception of deity, with the voice of his own conscience. He took the short and easy, but natural method, and denied the truth of the original conception. The metaphysical difficulty, however little it may vex mature minds, was a real one to him; and in connection with it Newman's statement may profitably be recalled, that no question is hedged about with more difficulties than the being of God. The moral difficulty, also, was a real one; and Robertson, whose Christian faith and sincerity none can doubt, was right in defending Shelley's decision and saying, "Change the *name*, and I will bid that *character* defiance with you." This was Shelley's atheism — on the one hand, a philosophical definition, and, on the other, the humanizing of a pre-Christian and medieval idea of God in accordance with that moral enlightenment which Christianity itself has spread through the world. Shelley expressed his denial in terms of blasphemy, as the words were then understood; but the "almighty fiend" whom he denounced was as much an idol as Dagon or Moloch.

What has the issue been? The conception which Shelley attacked with such vehemence no longer finds a voice in public discussion. It is as dumb as the ideas which once suggested such picturesquely lurid titles to the sermons under which our fathers trembled and transgressed. To-day the philosophical defini-

tion would be less difficult to frame, and it would awake no serious hostility; the moral ideal, too, is enthroned in religious conceptions as securely as in the conscience of man. It would be idle to say that advance has not been made, or to deny that it has pursued the lines of Shelley's instincts, his intellectual questioning, and his moral sympathies. Merely as a polemical writer he stood in the necessary path of progress; but as a poet, he vastly strengthened that moral enthusiasm which after his death regenerated religion as it had before inspired politics. He impressed his own moral ideal on those whom he influenced, and the old conception became as impossible for them as for him. Other forces united in the general tendency, for all things spiritual drew that way; nor is it possible to distinguish his share in the change that has passed over English theology in this century. But some sentences of the Rev. Stopford Brooke are apposite, and the opinion of such an observer may be allowed weight upon the question of Shelley's place in this field. "He indirectly made," says this writer, "as time went on, an ever-increasing number of men feel that the will of God could not be in antagonism to the universal ideas concerning man, that His character could not be in contradiction to the moralities of the heart, and that the destiny He willed for mankind must be as universal and as just and loving as Himself. There are more clergymen and more religious laymen than we imagine who trace to the emotion Shelley awakened in them when they were young their wider and better views of God." Whether this be true to the extent indicated is immaterial. It is enough if it becomes clear that Shelley's "atheism" was, by its revolt, the sign and promise of that liberalized thought and more humane feeling in respect to the divine dealing with men which characterized the religious progress of the time; that his denial has been sustained by the common conscience of mankind; and that the affirmations of the moral ideal which he made have been strengthened by years as they passed by, and have spread and been accepted as noble expressions of the conviction and aspiration of the men who came after him. Whether Shelley intended these results in the precise form that they took is also immaterial. It probably never entered his mind that clergymen would thank him for a liberalized orthodoxy, any more than that Owenites would use "Queen Mab" as an instrument in their propaganda, and thus give the widest circulation to that one of his poems which he would have suppressed. Certainly he had a conscious purpose to destroy old religious conceptions and to quicken the hearts of men with new ideals, not religious, but moral. If both results came

about, under the favor of time, and were such as the poet meant them to be, as in some measure was the case, and yet the influence also operated in an unexpected way by the reaction of the awakened conscience on the narrower faith to its liberalization instead of its destruction, this does not affect the reality of Shelley's work; it affords rather an example of that element in the poet through which, as Shelley said, he is an instrument as well as a power, and in neither capacity is wholly conscious of his significance.

The second tenet which immediately drew upon him scandal and obloquy was his belief that legal marriage was not a proper social institution. He had derived the opinion from his teachers, and held it in common with other reformers of the age. It is a view that from time to time arises in minds of an entirely pure and virtuous disposition under the stress of a rigorous and indiscriminating law. The state of woman under English law was then one of practical servitude, and in the case of unfit marriages might become, and sometimes was, deplorable. The continuance of forced union, on the side of either man or woman, after affection or respect ceased, was revolting to Shelley, the more so in proportion to the refinement and purity of his own poetic idealization of the relation of love. The helpless condition of woman under such circumstances appealed to him as a violation of justice and of liberty as well as a degradation of love. If since his time the rights of married women have been recognized by important and really sweeping changes in their legal status, and if the bonds of the legal tie have been relaxed, in both instances it was an acknowledgment of the reality of the social wrongs which were the basis of his conviction. If there is less tendency among reformers to attack the institution of marriage, and the subject has ceased to be conspicuous, though still occasionally manifest, it is because the removal of the more oppressive and tyrannical elements in the difficulty has relieved the situation. The belief of Shelley in love without marriage was an extreme way of stating his disbelief in marriage without love, as the law of England then was. There was, too, a positive as well as a negative side to his conviction, but in this he merely repeated the dream of the golden age, and asserted that in the ideal commonwealth love and marriage would be one; and this has been the common theme of Utopians, whether poets or thinkers, in all ages. In other words, it may reasonably be held that, in this case as in that of his atheism, an extreme view was taken; but in relation to the time and to the reforms made since then, his ideas of marriage held in them the substantial injustice of a state of facts then existing and the lines

of tendency along which advance was subsequently made. He reflected the age, and he foreshadowed the future; though the results, just as in the case of religion, consist in a modification, and not in demolition, of the ideas which he antagonized.

Shelley's atheism, however, and his views of legal marriage have had a disproportionate attention directed to them because of their close relation to the events of his own life. These were not the things in his philosophy for which he most cared. In the matter of marriage, though he acted on his belief in taking his second wife without a divorce from his first, in both unions he went through the form of marriage. He would never have so compromised with the world in an opinion which was a point of conscience with him. If it had been a question of the freedom of the press, or of the welfare of the masses, he would have stood by his convictions though they sent him to prison or the scaffold. The affairs which he took an active interest in, and endeavored to make practical, were political. At first the freedom of the press was nearest to him, and he helped with sympathy or money those whom he knew to be singled out for persecution by the Government; then the state of Ireland, Catholic emancipation, the putting of reform to the vote, the condition of the poor, exercised his mind and called out such labors as were open to him; at a still later time the Manchester riots, the revolutions on the Continent, and such larger matters engaged his enthusiasm. He was the most contemporary of all poets. His keen interest in what was going on was characteristic; he lost no occasion which gave him opportunity to use the question of the moment to spread his general principles. His immediate response to the hour is noticeable from the time, for example, of the death of the Princess Charlotte, on which he wrote a pamphlet, to that of the Greek rising, on which he composed a lyric drama. What poet before ever had occasion, as he did in the preface to "Hellas," to beg "the forgiveness of my readers for the display of newspaper erudition to which I have been reduced"? The words are most significant of the spirit of his life. It is also not useless to observe that a share of Shelley's violence, especially in early years, is due to the fact that he was actually in the arena and taking blows in his own person. Such a man does not, between the ages of seventeen and twenty-four, write with the same equable restraint as a student in his library; he is not likely to hold opinions in temperate forms; and if, like Shelley, he is by nature sensitive to injury and resentful of it, his language takes heat and may become extravagant. What he struggled with was not only thought, but fact. It was to his advantage,

doubtless, that he removed to Italy, where, being less irritated, he was able to express his abstract ideas in the quiet and undisturbed atmosphere of imaginative poetry.

These abstract ideas, his scheme of society, were acquired in his youth, and they were, as has been said, of the utmost simplicity. He adopted the doctrine known as that of the perfectibility of man. It is especially associated with the name of Condorcet. Shelley believed that society could be made over in such a way that virtue would prevail and happiness be secured. He thought that institutions should be abolished and a new rule of life substituted. He did not enter upon details. The present was wrong; let it cease: that was the whole of the matter. It was a form of what is now called nihilism. The state of society that existed seemed to him real anarchy. "Anarchs" was a favorite word with him for kings and all persons in power. His hatred was consequently centered on the established order. It was a government of force, and therefore he hated force; kings and priests were its depositaries, he hated them; war was its method, he hated war. The word is not too strong. Gall flows from his pen when he mentions any of these things. Their very names are to him embodied curses. If the system he saw prevailing in Europe bred in him such hatred, its results in practice filled him with pity. He was susceptible to the sight of suffering and misery, and almost from boyhood the effort to relieve wretchedness by personal action characterized him. He could endure the sight of pain as little as the sight of wrong. The lot of the poor, wherever he came upon it in experience or in description, stirred his commiseration to the depth of his heart. He was one of those born to bear the sufferings of the world, in a real and not a sentimental or metaphorical sense. He had seen the marks of the devastation of war in France; he knew the state of the people under tyrannical rule; he was as well aware of the degradation of the English masses as of the stagnation of Italy. Wherever he looked, the fruits of government were poverty, ignorance, hopelessness, in vast bodies of mankind. There was nothing for it but the Revolution, and heart and soul he was pledged to that cause.

But his hopes went far beyond the purposes of a change to be brought about by force for limited political ends; such an event involved the destruction of forms of power which he wished to see destroyed, and might result in amelioration, since force become popular was better than force that remained aristocratic; but his heart was set upon a change of a far different nature, more penetrating, more universal, more permanent—nothing less than that "divine result to which the whole creation

moves." Since Shelley, in common with the thinkers of his time, believed that the world's wretchedness was due to political misrule, and could be obviated by a change of institutions, he was on his practical side in alliance with every expression of revolutionary force; but he had an ideal side, and in his poetry it was this that found expression. He sang the golden age; time and again he returned to the theme, of which he could not weary, from the hour of youth, when he poured forth the story of man's perfect state in eloquence still burning with first enthusiasm, to the impassioned moment when he created the titanic forms of his highest lyrical drama, and bade the planetary spirits discourse in spherical music the pæan of peace on earth, good will to men. The paradise of "The Revolt of Islam," the isle of seclusion in "Epipsychidion," the echoes of the Virgilian song in "Hellas," like "Queen Mab" and "Prometheus Unbound," show the permanence before his rapt eyes of that vision of heaven descended upon earth which has fascinated the poets of all times. Yet how transform this "world's woe" into that harmony? Shelley's command was as simple, as direct as Christ's—"Love thy neighbor." No; there was nothing novel in it, nothing profound or original. It is so long now since man's knowledge of what is right has outrun his will to embody it in individual life and the institutions of society that new gospels, were they possible, are quite superfluous. What Shelley had that other men seldom have was faith in this doctrine, the will to practise it, the passion to spread it. There may be to our eyes something pathetic in such simplicity, as the belief of boyhood in goodness is pathetic in the sight of the man; something innocent, as we say, in such unworldliness, and again we intimate the eternal child in the poet's heart; but it is the simplicity and innocence—the pathos it may be—of what Christ taught. That Shelley believed what he said cannot be doubted. He thought that men might, if they would, love their fellow-men, and then injustice would of itself cease, being dried at its source, and that reign of mutual helpfulness, of the common sharing of the abundance of the earth's harvest, of man's enfranchisement from slavery to another's luxurious wants, would begin; war, poverty, and tyranny, force and fraud, greed, indulgence, and crime would be abolished. It was too obvious to need consideration; man was capable of perfection, and the method to attain to it was love, and this way once adopted, as it could be, by the fiat of each individual will, would en throne justice and spread virtue throughout the world. It was not reason that withstood this doctrine, but custom, tradition, interested individuals and classes, the active and law-intrenched power of institutions estab-

lished for the security and profit of the few—a whole order of society resting upon a principle opposite to love, the principle of organized force. If this time-incrusted evil, this blind and deaf and dumb authority of wrong long prevalent, this sorry scheme of accepted lies, could be destroyed at a stroke, a simple resolve in each breast would bring heaven on earth.

This was Shelley's creed. It may be false, impracticable, and chimerical; it may be a doctrinaire's philosophy, an enthusiast's program, a poet's dream: but that it has points of contact and coincidence with gospel truth is plain to see; and in fact Shelley's whole effort may be truly described as an incident in that slow spread of Christian ideas whose assimilation by mankind is so partial, uneven, imperfect, so hesitating, so full of compromise, so hopeless in delay. He had disengaged once more from the ritual of Pharisees and the things of Cæsar the original primitive commands, and made them as simple as conscience; he may have been wrong in the sense that these things are impossible to man in society; but if he was in error, he erred with a greater than Plato.

But it is not necessary to carry the matter so far. Shelley was a moralist, but he used the poet's methods. He declared the great commands, and he denounced wrong with anathemas; but he also gave a voice to the lament of the soul, to its aspirations and its ineradicable, if mistaken, faith in the results of time; and the ideas which he uttered with such affluence of expression, such poignancy of sympathy, such a thrill of prophetic triumph, are absorbed in the spirit which poured them forth—in its indignation at injustice, its hopefulness of progress, its complete conviction of the righteousness of its cause. He has this kindling power in men's hearts. They may not believe in the perfectibility of man under the conditions of mortal life, but they do believe in his greater perfection; and Shelley's words strengthen them in effort. No cause that he had greatly at heart has retreated since his day. There are thousands now, where there were hundreds then, who hold his beliefs. The Revolution has gone on, and is still in progress, though it has yet far to go. What part he has had in the increase of the mastering ideas of the century is indeterminate. He was dead when his apostolic work began. His earliest and unripe poem, "Queen Mab," was the first to be caught up by the spirit of the times, and was scattered broadcast; and wherever it fell it served, beyond doubt, to unsettle the minds that felt it. Crude as it was, it was vehement and eloquent; and the crudities which have most offense in them are of the sort that make the entrance of such ideas into uneducated minds more easy. It was nearer

intellectually to these minds than a better poem would have been. Rude thoughts not too carefully discriminated are more powerful revolutionary instruments than more exact truths in finer phrases. "Queen Mab" was certainly the poem by which he was long best known. The first revival of his works came just before the time of the Reform Bill, and they were an element in the agitation of men's minds; but his permanent influence began with the second revival, ten years later, when his collected works were issued by his widow. Since then edition has followed edition, and with every fall of his poems from the presses of England and America new readers feel the impulse of his passion, blending naturally with the moral and political inspiration of an age which has exhausted its spiritual force in pursuit of the objects that he bade men seek. Democracy, of which philanthropy is the shadow, has made enormous gains; the cause is older and social analysis has gone farther than in his day; his denunciation of kings and priests seems antiquated only because the attack is now directed on the general conditions of society which make tyrannical power and legalized privilege possible under any political organization, and in industrial and commercial as well as military civilizations; his objects of detestation seem vague and unreal only because a hundred definite propositions, developed by socialistic thought,—any one of which was more rife with danger than his own elementary principles,—have been put forth without any such penalty being visited upon their authors as was fixed upon him. This advance, and more, has been made. The consciousness of the masses, both in respect to their material position and their power to remedy it, has increased indefinitely in extent and in intensity in all countries affected by European thought; socialism, anarchism, nihilism are names upon every lip, and they measure the active discontent of those strata of society last to be reached by thought except the *bourgeoisie*. Whatever revolutionary excess may unite with the movement, the stream flows in the direct course of Shelley's thought with an undreamt vehemence and mass. That he still implants in others that passion of his for reforming the world is not questioned; his works have been a perennial fountain of the democratic spirit with its philanthropic ardor. As in the other phases of his influence, so in this its grand phase, his work has been in modification instead of demolition of the social order; it has been only one individual element in a world-movement issuing from many causes and sustained from many sources; but here too he fulfils his own characterization of the poet, imperfectly conscious of his own meanings, dimly prophetic of what shall be, belonging to the future whose ideas

come into being through his intuitions, sympathies, and longings.

Shelley's genius, then, it must be acknowledged, had this prescience by which it seized the elements of the future yet inchoate, and glorified them, and won the hearts of men to worship them as an imagined hope, and fervently to desire their coming. If one thing were to be sought for as the secret of his power on man, I should say it was his belief in the soul. No poet ever put such unreserved trust in the human spirit. He laid upon it the most noble of all ideal tasks, and inspired it with faith in its own passion. "Save thyself," he said, and showed at the same time the death in which it lay, the life of beauty, love, and justice to which it was born as to a destiny. Virtue in her shape how lovely, humanity throughout the world how miserable, were the two visions on which he bade men look; and he refused to accept this antithesis of what is and what ought to be as inevitable in man's nature or divine providence; it remained with man, he said, to heal himself. He was helped, perhaps, in his faith in the human spirit by the early denial he made of religion as interpreted by the theology of his period; for him salvation rested with man, or nowhere. In later years he made love the principle, not only of human society, but of the government of the universe; it was his only conception of divine power; but he never reconciled in thought this mystical belief with the apparent absence of this divine element from its lost provinces in human life. He promised men in their effort no other aid than the mere existence, in the universe, of beneficent laws of which mankind could avail itself by submitting thereto. The doctrine of the power of the human spirit to perfect itself, and the necessity of the exercise of this power as the sole means of progress, remained in unaffected integrity. This fundamental conviction is one that has spread equally with the democratic idea or the philanthropic impulse. The immediacy of the soul as the medium of even revealed truth is a conception that clarifies with each decade, and it is in harmony with Shelley's most intimate convictions, with those tendencies and dispositions of his temperament so natural to him that they were felt rather than thought. But in such analysis one may refine too much. It is meant only to illustrate how completely, in the recesses of his nature as well as in definite manifestation of his thought, he was the child, intellectually and morally, of the conquering influences implicit in his age, so readily apprehensive of them that he anticipated their power in the world, so intensely sympathetic that he embodied them in imagination before the fullness of time, so compelled to express them that he was their prophet and leader in the next ages.

By his own judgment, therefore, of what great poets are, he must be placed among them, and the office of genius, as he defined it, must be declared to be his. The millennium has not come, any more than it came in the first century. The cause Shelley served is still in its struggle; but those to whom social justice is a watchword, and the development of the individual everywhere in liberty, intelligence, and virtue is a cherished hope, must be thankful that Shelley lived, that the substance of his work is so vital, and his influence, inspiring as it is beyond that of any of our poets in these ways, was, and is, so completely on the side of the century's advance. His words are sung by marching thousands in the streets of London. No poet of our time has touched the cause of progress in the living breath and heart-throb of men so close as that. Yet, remote as the poet's dream always seems, it is rather that life-long singing of the golden age, in poem after poem, which most restores and inflames those who, whether they be rude or refined, are the choicer spirits of mankind, and

bring, with revolutionary violence or ideal imagination, the times to come. They hate the things he hated; like him they love, above all things, justice; they share the passion of his faith in mankind. Thus, were his own life as dark as Shakspeare's, and had he left unwritten those personal lyrics which some who conceive the poet's art less nobly would exalt above his grander poems, he would stand preëminent and almost solitary for his service to the struggling world, for what he did as a quickener of men's hearts by his passion for supreme and simple truths. If these have more hold in society now than when he died, and if his influence has contributed its share, however blended with the large forces of civilization, he has in this sense given law to the world and equaled the height of the loftiest conception of the poet's significance in the spiritual life of man. Such, taken in large lines and in its true relations, seems to me the work for which men should praise Shelley on this anniversary, leaving mere poetic enjoyment, however delightful, and personal charm, however winning, to other occasions.

*George E. Woodberry.*

## TOPICS OF THE TIME.

### Popular crazes.

NO portion of Professor James Bryce's "American Commonwealth" reveals more strikingly the author's remarkable insight into American methods and character than the twelve chapters on Public Opinion which constitute Part 4 of Vol. II. Every American who is interested in the efforts which his own country is making to work out successfully and completely the problem of popular government can read those chapters with profit, for he will find in them, clearly and forcibly set forth, many things that he has dimly conceived but has never been able to think out thoroughly for himself.

Professor Bryce holds that "in no country is public opinion so powerful as in the United States," and in the course of his searching and able discussion of why it is so he makes certain observations which we wish to cite at this time as having an especial bearing upon the subject that we wish to consider in the present article.

Remarking that one of the chief problems of free nations is "to devise means whereby the national will shall be most fully expressed, most quickly known, most unresistingly and cheerfully obeyed," he says:

Towards this goal the Americans have marched with steady steps, unconsciously as well as consciously. No other people now stands so near it. . . . Towering over Presidents and State Governors, over Congress and State Legislatures, over conventions and the vast machinery of party, public opinion stands out in the United States as the great source of power, the master of servants who tremble before it.

There is no one class or set of men whose special func-

tion it is to form and lead public opinion. The politicians certainly do not. Public opinion leads them.

A sovereign is not less a sovereign because his commands are sometimes misheard or misreported. In America every one listens for them. Those who manage the affairs of this country obey to the best of their hearing. The people must not be hurried. A statesman is not expected to move ahead of them; he must rather seem to follow, though if he has the courage to tell the people that they are wrong, and refuse to be the instrument, he will be all the more respected.

Professor Bryce goes on to argue that one reason why public opinion is so powerful is the universal belief of the people in their star, a "confidence that the people are sure to decide right in the long run," that "truth and justice are sure to make their way into the minds and consciences of the majority." Every one who has studied the history of this country knows how true all this is. Whenever a new peril threatens us from any quarter, either in the form of some abuse in legislation or in administration, or in the form of some fresh financial or economic heresy, the final stronghold of hope to which every anxious observer clings is the conviction that the people will decide right in the end. Our national history is the record of a succession of perils of one kind or another, suddenly averted at the very moment when they seemed to have become most impossible.

The recent collapse of the Free Silver Coinage "craze" makes a review of similar popular delusions timely. We have had many of these since the war, and all of them have passed away as suddenly as they arose, after a uniformly brief and absorbing period of existence. No one can contemplate them after they have

passed and not doubt whether they were really as strong with the people as they appeared to be; whether they might not be, after all, mere instances of what Professor Bryce calls the "mishearing" of public opinion. There was the Granger movement, which appeared in 1873, and which seemed to carry everything before it in the Western States. It did elect a governor in one of those States and legislatures in a few others, but by 1876 not a trace of it remained. It was followed by the Greenback movement in 1878, which threatened the supremacy of political parties in all parts of the country, actually gaining the control in Maine, polling many thousands of votes in nearly every Western State, and making inroads upon the old parties even in New York State. By 1880 nearly every trace of this "craze" had vanished. Next came the Labor movement, which sprang from the great strikes of 1886. In the fall of that year Henry George polled 68,000 votes, nearly one third of the entire number cast, as Labor candidate for mayor of New York city, and shrewd politicians were convinced that the Labor vote would be the controlling force in the presidential election of 1888. Yet when 1888 arrived, scarcely a trace of the movement, as a separate force in politics, was visible.

Following close upon the Labor movement came that of the Farmers' Alliance, with the sub-treasury money plan as its chief issue. In 1890 this was so powerful that it carried two Western States, and seemed certain to threaten the dominion of the Democratic party in the South. Yet in the elections of 1891 it cut scarcely any figure, and has been fading rapidly from existence since that time. The Free Silver delusion, which accompanied it, and remained after its demise, seemed, when the new Congress assembled in December last, destined to overcome all opposition, and to plunge the country into the most direful cheap-money experiment of modern times. Yet at the critical moment this peril was averted, and at the present time the "craze" itself has so nearly disappeared that one wonders if it really ever was formidable.

In every instance public opinion was the sovereign under whose commands the "craze" was abandoned by the politicians. As soon as they discovered that the people did not favor the movement, they hastened to turn against it. It is, of course, impossible to say whether or not the people had ever been so strongly in favor of any of these various "crazes" as the politicians supposed. Undoubtedly more were in favor of them at their birth than at the moment of their abandonment, for in the intervening period the work of education had been in progress, and the American people are quick to discover an error and equally quick in correcting it. We are convinced, however, that in nearly or quite every instance the politicians had, to use an apt phrase of Professor Bryce, "mistaken eddies and cross currents for the main stream of opinion." They had been so fearful lest public opinion should get ahead of them that they hastened to stimulate the "craze" in order to benefit by it, rather than to point out to the people their mistake and trust to their intelligence and honesty to bring them around to the right side in the end.—As Professor Bryce well says, the statesman who has the courage to tell the people that they are wrong "will be all the more respected," but this is a truth which the lower grade of politicians is slow to learn.

#### What is Patriotism ?

It was suggested some months ago by some one who was impressed with the need of a keener sentiment of patriotism among the American people, that such a sentiment could be cultivated by certain observances in the public schools. The chief of these was to be the daily display of the American flag upon all school buildings, and the daily formal salute of it by the pupils. It is indeed a pleasant and inspiring sight, and not without a patriotic effect upon children and the general population—the flag flung to the breeze from the school-house in the city street, or on the country hillside or valley. But according to our observation young Americans draw in a love of the flag and of their country as the British general in the Revolutionary War said the boys of Boston did—"with the air they breathe." They think the American flag the most beautiful in the world, and the American nation the most powerful and glorious on the earth. This is the spontaneous and unreasoning patriotism of childhood, and the country which did not inspire it would be in a sad condition.

There are no signs of a lack of this childish patriotism in this country. Concerning the supply of reasoning patriotism, which ought to be developed from it as the youth advances to manhood and takes his place as a citizen, the case is less clear. It must be said that many men carry through life, without change or development, the unreasoning patriotism of childhood, and are thus the easy victims of the sham statesmen and politicians who make patriotism not merely the "last refuge of a scoundrel," but, as the Rev. J. W. Chadwick said recently, the "first. Men who take "my country, right or wrong," as the complete epitome of patriotism, are the most useful, though unconscious, allies of those who do the most to injure their country's fame. Lowell, with his unerring touch, has put his finger on the crucial test of all patriotism, by saying in regard to doubts about his own love for his country,

I loved her old renown, her stainless fame,—  
What better proof than that I loathed her shame ?

That is the true kind of patriotism which no country can have too much of—a patriotism which loathes everything that brings shame to the nation's honor, or to its reputation before the world. A patriotism of that kind makes short shrift with political tricksters and time-servers, by condemning them as disgracing their country and dishonoring its name. No nation is so great that it can afford to be unjust, or to act the bully toward weaker nations, or to conduct its public affairs in violation of moral and economic laws. The highest conception of a country is expressed in the Scriptural phrase, "Righteousness exalteth a nation." The real patriot is the man who wishes to see his country glorious through the reign of intelligence, truth, honor, and justice in all its public affairs, and through the high value of its contributions to the civilization of the world. The only kind of patriotism worth having is that which holds up this model of a country, and rejects as unworthy all that stands in the way of its achievement.

There is no more persuasive teacher of patriotism than the true politician or statesman, as Lowell has described him.

He is not so much interested in the devices by which men *may* be influenced, as about how they *ought* to be influenced; not so much about how men's passions and prejudices may be utilized for a momentary advantage to himself or his party, as about how they may be hindered from doing a permanent harm to the commonwealth.

Under the guidance of statesmen of this type, politics becomes a very different pursuit from what it usually is in this country. Of politics, in the true sense of the word, the American people have a very inadequate conception. What they think of when they hear the word is something very unlike this definition, which stands first under the word in "The Century Dictionary":

The science or practice of government; the regulation and government of a nation or state for the preservation of its safety, peace, and prosperity. Politics, in its widest sense, is both the science and the art of government, or the science whose subject is the regulation of man in all his relations as the member of a state, and the application of this science. In other words, it is the theory and practice of obtaining the ends of civil society as perfectly as possible.

Nobody can deny that we need in all parts of the land politicians of this character, earnest, able, trained men, who are so thoroughly grounded in the science of politics, who have such complete knowledge of governmental laws and social and economic principles, such familiarity with the history of politics and political systems in all lands and times, that they will be able when occasion offers to stop the progress of "crazes" and delusions, simply by showing from the teachings of human experience and the working of established laws the impossibility of their success in practice. In no country in the world are liberally educated men, in the true sense of the word, more needed than they are in the United States, and in no country in the world are they more powerful, for of all peoples, Americans are the most eager to learn the truth and the quickest to grasp it when it is presented to them. The breeding of citizens of this character in our schools and colleges is the surest way by which to develop patriotism of the highest type.

#### Trade Schools.<sup>1</sup>

In giving a half-million dollars for the endowment of the New York Trade Schools, Mr. J. Pierpont Morgan has set the millionaires of the country an example which, it is greatly to be hoped, many of them will imitate. It would be difficult to conceive a more beneficent use of wealth than this. The object of such schools is to furnish the young men of the country with the means of learning, quickly and thoroughly, useful trades; that is to say, to supply them with the best qualifications for leading upright, industrious, and useful lives. We have in this country abundant school privileges, and are constantly enlarging our facilities for the education of youth who desire to live by brain-work as distinguished from manual labor; but for the youth who would be glad to fit themselves for lives of manual labor we have, until within a few years, furnished no educational facilities whatever.

One of the first men to perceive the need of an educational system of this kind was Colonel Richard T. Auchmuty, of New York city. About eleven years ago

he established the New York Trade Schools for the purpose of giving young men instruction in certain trades, and to enable those already working in such trades to improve themselves. At first instruction was given mainly in the evening to pupils who were engaged in workshops during the day, and who were dissatisfied with what they were learning in them. Gradually other young men who had finished their school-days, and had no definite occupation in view, became interested. They were unwilling to learn a trade by entering a shop as apprentices, but they were very glad to avail themselves of this method of not only learning it rapidly and thoroughly, but without unpleasant or humiliating surroundings. In their eagerness to learn many of these young men joined both day and evening classes.

From small beginnings the schools grew rapidly, until at the end of eleven years the attendance was nearly 600, instead of 30 as at the beginning. The trades chiefly taught are plumbing, plastering, stone-cutting, painting, bricklaying, carpentering, and tailoring. Instruction is given by master mechanics and other competent teachers, and practical work is accompanied when necessary by the study of technical books and diagrams. The pupil is not only taught how good work should be done, but the difference between good and improper work. The purpose of the instruction is "to enable young men to learn the science and practice of certain trades thoroughly, expeditiously, and economically, leaving speed of execution to be acquired at real work after leaving the schools." The prices charged for instruction are scarcely more than nominal, relieving the schools of the charitable aspect and giving the pupils a manly sense of paying their way.

The benefits of this system of education are obvious and great. The thoroughness of the instruction sends out workmen of the best type, scientific, thinking, progressive men, who become the master mechanics and inventors of the future. They are the kind of workmen who give dignity to labor, and who, in addition to elevating the condition and character of their fellow working-men, make good citizens in whatever community their lot may be cast. If every city in the land were to have its trade schools, modeled after those established by Colonel Auchmuty, and nobly endowed as his have been by Mr. Morgan, the work of reducing the mass of idleness and consequent viciousness which exists in our large cities would be begun in the most effective way.

When Colonel Auchmuty began his experiment, trade instruction in schools was little known in this country, though it had long been in existence in Europe. In this country, in addition to the trade schools of New York, Philadelphia, and Chicago, trades are now taught to beginners at the Pratt Institute in Brooklyn; at the Free Institute in Worcester, Massachusetts; at the Hampton Institute, Virginia; at Clark University, Georgia; at Central Tennessee College; to the Indians at Carlisle Barracks, Pennsylvania; in some of the colleges endowed by the United States land grant act; and in many asylums and reformatories. The Carriage Makers' Association in New York has a school for young men in that trade, and the Master Plumbers' Association in some cities provides instruction for its "helpers." We have made a beginning in this country, but have done little more than that. Colonel

<sup>1</sup> See also "The Need of Trade Schools," THE CENTURY for November, 1886, and "An American Apprentice System," January, 1889; both by Colonel Auchmuty.

Auchmuty's schools are now assured of a future of large and constantly increasing usefulness, and ought to serve as a model for others in all the large cities of the land.

These schools, in fact, supply the only means by which American boys can become skilled workmen. The old apprentice system has gone, never to return. Both the spirit of the time and the changed conditions of trade are against it. Outside the large cities, in the so-called country districts, boys can still be taught a trade by the workers in it; but in the large cities, where skilled labor is in demand, this is no longer possible. The trade-unions in these cities are controlled by foreigners who seek to confine their industries to men of their own nationalities. They not only refuse to teach an American boy a trade, but they combine to prevent him from getting employment after he has succeeded in learning it in a trade school. This is a situation of affairs without parallel in any country in the world, and one which will not be tolerated in this country when once public opinion has been aroused to a full comprehension of it.

Colonel Auchmuty has shown from statistics that out of \$23,000,000 paid annually to mechanics in the building trades in New York city, less than \$6,000,000 goes to those born here. The number of new journeymen trained outside the cities in the trades themselves is not sufficient to fill vacancies, much less to supply the constantly increasing demand for larger forces. Thousands of foreign mechanics come here every year, some to remain, others to work through a busy season and return to Europe with their profits. These foreigners have no sympathy with Americans. They control the trade-unions, which in turn control the labor market, absolutely in their own interest. They seek to keep wages high by closing the doors of employment to all comers not of their own kind. The result is that in free America, sometimes called the paradise of working-men, the field of skilled labor is occupied almost exclusively by foreigners who declare that an American boy shall not enter, either to learn a

trade, or to find employment if he shall have been able to learn his trade elsewhere.

We present to the civilized world the astounding spectacle of a great nation, which boasts itself the freest on the globe, throwing open its vast and lucrative fields of skilled labor to the mechanics of all other nations, while closing them to its own sons. Was there ever a more incredible act of national folly! We have in America material from which to make the best and quickest mechanics in the world — that is the testimony of all competent authorities; yet we refuse either to train them or to give them work if trained. We deplore the existence of increasing numbers of idle and unoccupied young men in all our cities, and then accept conditions which compel a multiplication of the numbers. It is useless to put the blame upon the foreign laborers: they are merely improving their opportunity. The American people are responsible, and they must supply the remedy.

The first step toward the remedy is the multiplication of trade schools, and the second is the insistence upon the free exercise of every man's right to earn his living in his own way. It is surely not too much for the American people to say that their own sons shall not only be permitted to learn trades, but shall be permitted also to work at them after they have learned them. We advise any one who is desirous of seeing the kind of skilled working-man that the American boy makes, to visit Colonel Auchmuty's schools and look over a set of photographs of his graduates. He will find there a body of clear-browed, straight-eyed young fellows who will compare well with the graduates of our colleges. This is the stuff from which laborers are made who honor and dignify and elevate labor, not by agitating, but by being masters of their craft, faithful in its performance, and willing to share its toil with all comers, fearing honest competition from no quarter. Such men are at once true American laborers and true American citizens of the highest type, and the educational system which evolves them is a national benefaction of incalculable value.

## OPEN LETTERS.

### Camping Out for the Poor.

NEARLY twenty years ago I left New York late one afternoon toward the end of June to take my fortnight's vacation in a little hamlet a mile east of Moriches, on the south or ocean shore of Long Island, seventy miles away from New York. The day had been a particularly hot and exhausting one. The city literally panted for breath. As I walked down to the ferry I had to pass through some of the most miserable of the tenement-house districts on the east side, and for a few blocks I went along Cherry street, a most wretched thoroughfare blessed with a pretty name in grotesque contrast to the street's character. The slums were alive with people.

The shades of night seemed to bring no comfort to such streets as these. It would be morning before the heated masses of brick and stone cooled off, ready for another day's sun, for there was not a breath of air.

I could not help contrasting the scenes in which I should find myself twenty-four hours later with this squalid, heated misery, and it really seemed as if I had no right to run away while so much wretchedness remained behind, unable to escape. I suppose that most of my readers have experienced this feeling when about to get away from New York in summer, and then, as I have so often done, they have put the unpleasant thought away with the consoling reflection that what little they could do to alleviate such misery, even by the sacrifice of their own vacations, would be but a drop of honey in this ocean of gall. We have also the habit of saying to ourselves that the poor people who remain in town the year round do not suffer as we imagine they do — they are thicker-skinned, and they have never known anything better.

But upon this particular occasion, although I was not an over-sensitive young man, the scenes upon which I could not shut my eyes haunted me for days, and I

felt that I was running away from a problem which ought not to be put aside. I still remember one picture of an apparently motherless child, sitting on the lower step of a big double tenement—a little girl of ten or twelve years of age, who was trying to sing to sleep two younger children, one in her lap and the other pillowed against her arm. The child was pale and tired, but ready to sacrifice herself for the sick and peevish little brother and sister whom the noise and rattle of the street kept awake. The father was crouched on the same step, in a drunken stupor, but cared for by the child. As I stopped to look at the pitiful picture, too common for notice in all these tenement neighborhoods—the child mother—I again asked myself what right a strong fellow had to go in search of sea breezes and quiet while such weaklings as these remained behind? But I soothed my conscience by dropping some pennies in the child's lap, and hurried on to my boat.

It happened that about twenty-four hours later I had occasion to study another family group. We had been fishing all day, and were on our way back to Moriches when our boat grounded upon the flats which fill these bays; and, there being no moon, we decided to sleep on board. One of our party desecrated a light on the shore a few hundred feet from us, and we pushed our sharpie off in that direction, hoping to find some natives who would pilot us to deep water. On the south side of a giant rick of salt grass we discovered a camp-fire, around which were grouped a father, mother, and five children. The man told us that he was a New York shoemaker, and knew nothing of the channels. They were on an island on the south side of the bay, and their only means of communication with the mainland was an old row-boat for which the man paid one dollar a month.

They had a tent, which was used apparently only to sleep in, and when I made the party a call some days later, I found the man working at a box of shoes he had brought with him from New York, to finish. The whole family looked like gipsies, they were so browned and hearty. The man told me that he liked that sort of life in hot weather, and had camped out for several summers. He did enough work to earn the very few dollars their supplies cost them, and in September they would go back to New York—he to the shop he worked in, and the children to school.

While these two pictures, both met with at about the same hour in the evening,—the one in the squalid, reeking, murky Cherry street, in which figured those little prisoners of poverty, and the other of island life and cool air,—impressed me deeply at the time, it was long before I drew any particular lesson from them.

It was not until years later that I began to ask myself why the poor people who suffer every summer in New York, and whose children die from heat, do not join my shoemaker on his island in Moriches Bay. Now, however, it is one of my hobbies that the New York mechanic and clerk can afford a far better outing in summer than he dreams is possible.

In the case of clerks or assistants in small business houses, such a course as I have to propose would not be possible, and in some trades, such as those connected with building, the hot months are the busiest and the men cannot get away. But in a large number of shops and factories the dull season comes in the hot months. I have not the slightest doubt but that the proprietors of thousands of large retail shops in all our large cities

would be only too glad to give their clerks a ten-weeks' vacation provided salaries stopped during those ten weeks; and the same is true of the thousands of factories which are kept open on half time and often at a loss to the proprietor, who wishes to keep his men together. The tendency of late years, especially since the shorter hours of labor have prevailed, is to pay all workmen by the piece in factories and wherever such a course is possible. In many trades, such as the making of cheap clothing, cigars, etc., in which the work is done at home, it may be done in one place as well as another, allowing a small amount for getting the bundles of goods in and out of New York. I suppose that if the taste prevailed for such a life as seems to me desirable for the poor city family during the ten hot weeks of the year, when the city bakes and the children die of heat and bad air, at least half of the workers who live in the tenements might escape.

I am well aware that something of the same kind, but upon a more permanent scale, has recently been attempted without success. One of the benevolent societies connected with Mr. Adler's Society for Ethical Culture subscribed enough money to build a dozen comfortable cottages in a pleasant spot some twenty miles out on Long Island, and induced some poor families of Polish Jews who worked on cheap clothing to make the experiment of living there, the society making the rent almost nominal and also paying the express charges upon the packages of clothing sent in and out from the large shops which gave these people employment. It was hoped that the advantages of a country life, of pure air for the children, of lower rents than in their dirty, miserable tenements, of the possibility of a garden, chickens, etc., would encourage others to join such a colony. The result was disappointment, and after a year the experiment was abandoned. The people, especially the women, wanted to get back to the city; they complained that it was lonely. They wanted society—the noise and squabbles, the fights, the dirt, and the crowds of the tenements. This result showed that if these people were to be taught the value of fresh air and quiet, the process must begin with the children. Their elders were like the life prisoners who, when released from the dark dungeons of the Bastille, begged to be taken back—they had lived so long in the dark as to dread the light.

In such an experiment as I now propose, I wish simply to get such people out of New York during the heat of summer, when the death-rate is largely made up of infants and small children. The system under which such people rent their small tenements makes it possible for them to give up their few rooms at a week's notice. They can store their goods at small expense, and save enough on the rent to pay for their food during the weeks they are away. The rents paid by even the most miserable of these workers average \$10 a month for two or three rooms. The "boss" who employs them cares nothing as to where their work is done.

Take the typical family of slop-shop clothing-makers. The mother and father sew all day, and the children live or die according to their constitutions. What is to prevent such a family from pitching its tent on some of the beaches which stretch out for more than one hundred miles along the south shore of Long Island, or in the Jersey pines? The spots along the south

shore of Long Island which are inhabited and valuable are as nothing compared to the wastes of equally pleasant land upon which a poor family may "squat" during hot weather, either free of rent or for a trifling payment to the owner of the land. If all the poor of New York wanted to "squat" on the Long Island beach, there might be objections raised; but of that there is no danger. The man who can get out of town must have at least a few dollars in his pocket, and every one who has worked among our city poor knows that the majority of these people live from hand to mouth; they are chained by the hardest of poverty to the great city. Fortunately, the average sober mechanic needs but a very few dollars to make such an experiment possible.

In some figures I gave in the course of an article published on this question I estimated, judging by what such outings in the past have cost me, that a poor family of six persons — two adults and four children — would be able to spend ten weeks out of New York at an average weekly expense of not more than \$5. A tent, an oil-stove, some cots, and a few boxes of bedding and stores would complete the whole outfit. Even the oil-stove would not be needed every day if the family "squatted" on the ocean beach, for the beach is strewn with kindling-wood. I leave out of the calculation the cost of getting from and back to New York, as that depends upon the distance. Our typical family could go fifty miles and back for \$10. The cost of getting a big bundle of clothing from New York once a week by express would not be more than a dollar. In case steady work was carried on, there would also be a sewing-machine to take. The oil-stove, the cots, the sewing-machine, are already owned by most of these poor families. The tent would cost from \$15 to \$25, according to size, and would last for years. The food would certainly cost less than in New York, for in most places along the Long Island shore there are clams, oysters, crabs, and fish, which the children can get with little trouble.

Now consider the drawbacks and advantages of such a life. Upon one side we place the isolation which seems to have such terrors for the tenement-bred poor; but if two or three families made the experiment together, this would disappear. There would be rainy days and the various unpleasant features and hardships of camping out. There would be no corner liquor-store for the man, nor corner gossip for the woman. The daily toil might be even a trifle harder, owing to lack of conveniences. Meat would be difficult to get and to keep. But look at the other side of the picture. First of all, while New York baked night and day, there would be clear, cool air for the little ones, worth all the medicines in the world. The children could run barefoot on the beach, could bathe in the surf and play in the sand; and what more, after all, can the millionaire give his children during these hot weeks?

If the man and his wife are above the common herd and are able to appreciate the quiet and beauty of the ocean beach in summer, the glorious rising and setting of the sun, a series of pictures beyond the power of any artist to copy, they will find more than repayment for any personal sacrifice they may make for the children's sake. I should imagine that most men not wholly unfitted for decent things and depraved by the corner grogshop would find in the majesty, the quiet, and the beauty of a summer evening on the ocean beach a comfort beyond words. Think of smoking a pipe after a

day's labor, and watching the flame of a driftwood fire rising against a background made up of ocean and bay!

I should like to see some society undertake to teach poor people the possibility and value of such an outing as I have in mind. It would virtually be camping out for the hot months, a pastime commonly considered as within the reach of the rich or the well-to-do only. The proprietors of many large shops and factories ought to be members of such a society, for they can arrange to do without half their force in summer and save money by so doing. Employer and employed ought to cooperate in such a scheme. The employer will not be afraid of losing good clerks and salesmen; the employed will not fear loss of position, and will return in September better fitted for ten-months of work than if he had lounged the summer away behind a counter. The tremendous waste of time in summer is recognized by every business man. If work of every description could stop from the first of July to the first of September, our mechanics would certainly have more to do when they returned to their shops, and they would be in better trim to do it, provided their eight weeks of vacation had been wisely spent.

Perhaps the greatest obstacle in the way of a wholesale realization of a scheme upon this plan is the fact that so few poor people have even the small number of dollars necessary to it. A man cannot stop work or stop looking for work if there is no bread in the house. Upon the other hand, it may be said that persons and families likely to enjoy and appreciate camping out in July and August are usually fairly provident. What might be done by a Camping-out Society would be to tell poor people where and how they might camp out, the advantages and disadvantages of the life, its cost, its ways and means. I should like to hear camping-out lectures in which people who had camped out would give their experiences for and against the life.

I should like to say to such of my conservative friends as scent socialism and vicious idleness in this idea, that if one per cent. of the tenement-house population is induced by a vigorous advocacy of the camping-out idea to make the experiment, I shall be amazed. One poor man whom I urged to make the experiment and take his sickly children to a bit of beach I knew, told me that the noise of the "bloomin'" ocean made him "blasted" tired. There are too many people who cannot see the trees for the forest. They have been in the Bastille of vile air, dirt, and death too long to realize what a world of content lies beyond the grimy tenement. But even if one family in every thousand could be induced to camp out next summer, the experiment would be worth making. I have been accused of fanaticism in my detestation of city life,<sup>1</sup> especially in summer, and I have advised people to try the country even if at some sacrifice of dollars and personal comfort. But in this instance I merely advise a better use of time that is now nearly or wholly wasted.

*Philip G. Hubert, Jr.*

#### A Search for Shelley's American Ancestor.

THE tradition that the grandfather of the poet Shelley was born at Newark, in America, of an American mother, was the scent which led me off upon a two-

<sup>1</sup> "Liberty and a Living," Putnam's Sons, New York.

weeks' record hunt, in behalf of THE CENTURY, and apropos of the Shelley centennial.

Timothy Shelley, born April 19, 1700, third son of John Shelley, of Sussex, England, emigrated to America, and is said to have married here a widow named Johanna Plum, and to have had two children born here, and named respectively John and Bysse. It is said that Bysse Shelley was baptized August 1, 1731, at Christ Church, Newark. With this tradition comes the statement that the house at Guilford, Connecticut, in which the poet Fitz-Greene Halleck passed the closing years of his life, had once belonged to an ancestor of Shelley, the English poet. There are other statements—such as that Timothy Shelley had followed the trade of apothecary in the colonies; that he had practised as a quack; that he had deserted his American wife, and that he had run away to England to avoid his creditors. It seemed natural to me to seek information where the American land-holding was, so I turned my attention first toward Guilford.

The New Haven Colony came from Massachusetts early in the seventeenth century, and in 1666 sent a branch colony to the Passaic, so that there is close historic connection between Guilford and Newark. In the library of the Historical Society at New Haven there is a carefully written manuscript of Guilford births, marriages, and burials, in which I found several pages of Shelleys. Among the 162 individuals therein mentioned there are many who bear Old Testament baptismal names, such as Shubael, Ebenezer, Benjamin, and Reuben, and two or three known by that of Timothy. There is no record of any Shelley taking a wife named Plum, maid or widow, and the name of Bysse does not appear at all. Guilford still keeps its old colonial records, and there I found in the vault of the office of the town clerk vellum-bound volumes containing notes of the original apportionment of lands, minutes of boundary settlements, copies of wills, deeds, and bonds from the earliest date of the settlement. In these books are names of many Shelleys, from the first Robert, who came over in the *Lion* in 1632, and married Judith Garnet of Boston in 1636, to another Robert who owned the land upon which the old-fashioned frame-house once occupied by Halleck now stands. From this Robert this portion of the "home lot," to follow the description considered sufficient in the simple old days, came to Nathaniel Elliott, who gave it to his daughter Mary, the wife of Isaac Halleck and mother of Fitz-Greene Halleck, the poet. From this, doubtless, grew the story which gave the Halleck house to an ancestor of Percy Bysse Shelley.

The Shelleys of the seventeenth century were nearer to the common ancestor, and when Timothy came over early in the eighteenth it may be that he found his first welcome from kinsfolk in Guilford, and that the first American Timothy, who died at Branford in 1738, was named for him.

A close search amongst the archives of the New Jersey Historical Society in Newark revealed the existence of a Samuel Shelley who in 1776 was a soldier in the War of Independence. The family of Plum is here abundantly evidenced by both printed and manuscript references.

Samuel Plum was one of the original party who came from New England. From his stock, which continued prosperously in Newark for many generations, came

most likely the American wife of Timothy Shelley, who became thus an ancestress of the English poet. The Newark records show that the family of Plum was large and widely connected, and might well have furnished a daughter or a widow to mate with the handsome young Englishman. There is indeed notice of a Johanna Plum who died March 9, 1760, at the age of fifty-two, but it is difficult to decide whether she was spinster, wife, or widow. It is curious and apt that in the story of these early days there is much mention of a certain Captain Giles Shelley of New York, master of the bark *Nassau*, who fell into trouble with the New Jersey authorities in 1699 by landing a cargo of contraband goods at Woodbridge, and who lived not free from suspicion of strange doings upon the far high seas, and association with Captain Kidd. The church records, which would tell us beyond question where and when the marriage of Timothy Shelley and the births of his two sons occurred, went to feed the bivonac fire of some Hessian contingent or British troop; for it is well established that when Newark was occupied by the King's forces in the Revolution, old Trinity was used as a stable for the horses of the troopers, and on their departure only the blackened stones of the old building remained to witness the work done both by the priest who came to the cure of souls at the beginning of the century, and by the soldiers who came at its end to dispose of the bodies of the colonists.

In the office of the clerk of Essex County at Newark there is a book of old colonial court records which contains the information that "at a Courte holden the 4th Tuesday of November, A. D. 1734," Timothy Shelley sued David Hayward for the sum of £15, and that the sheriff returned that he had attached the body of the defendant. It also contains the entry of an action for slander during the January term, 1738, wherein Timothy Shelley was plaintiff and John Nettle was defendant, and the sheriff's return of arrest of the latter. The original narration or statement of the cause of suit might give us much information, but though I made a thorough examination of the papers relating to early litigation which are preserved in the custody of the Essex county clerk, I found neither the narration in Shelley *vs.* Hayward, nor that in Shelley *vs.* Nettle. It appears from these papers that there was a Benjamin Shelley in Newark in 1732, and that on April 10, 1734, one "Cunney High, Shelley's godson," was indebted to Samuel Wheaton in the sum of one shilling and one penny.

The office of the Secretary of State at Newark contains the colonial probate and real-estate records of East New Jersey, and here I found the will of a Widow Shelley, but she was of New York; her name was Heelegand, she had been a Van Horne as a maiden, and she had died in 1716, all against the hope that she had been the widow of Timothy. I suspect she was the widow of the sea-rover Giles, for I find that after writing his owners in 1699 that he had brought back with him from "Macadagascar" to their account twelve thousand pieces of eight and three thousand "Lyon" dollars, he soon after loaned three hundred "Mexican pillar pieces of eight" on a mortgage of lands on the Raritan River and at Barnegat, which mortgage, as is indicated by a subsequent record, appears to have come to the executor of his will. Heelegand Shelley seems to have had some interest in East New Jersey lands

and this mortgage is the only record by which such an interest is traceable.

The last place of my search was the office of the Register of Deeds in New York city. Little thinking to find anything of importance there, I found the most definite and interesting of all the records. In Liber 32 of Conveyances, at page 368, is a copy of a document which is in form a post-obit, and is curious enough to be repeated here in words and letters as it stands upon the record-book:

RECORDED for Capt. William Bryant of the City of New York, Mariner, this 30<sup>th</sup> day of May Anno Dom. 1743.

KNOW ALL MEN by these presents that I Tim<sup>o</sup> Shelley of Newark in America, Merchant, my heirs &c am held and firmly bound unto William Bryant of the City of New York in America, Marriner in the sum of Two hundred pounds of Sterling money of Great Britain to be paid to the said William Bryant, his certain attorney, Executors, Administrators or assigns, to which payment well and truly to be made and Done I do bind my Self my heirs Executors and administrators and every of them firmly by these presents. Sealed with my seal dated the six day of December In the ninth year of the Reign of our Sovereign Lord George the Second by the grace of God King of Great Britain, France and Ireland Defender of the faith and so forth and in the year of our Lord One Thousand Seven hundred and thirty five.

THE CONDITION of this obligation is such that if the above bounden Tim<sup>o</sup> Shelley his heirs Executors or administrators shall and do well and truly pay or cause to be paid unto the above named William Bryant his certain Attorney Executor administrators or assigns the full and just sum of One hundred pounds sterling money of Great Britain aforesaid and that so soon as he the said Tim<sup>o</sup> Shelley shall be possessed of an Estate of the value Two hundred pounds a year sterling which now belongs to his father John Shelley of Fenn place in the county of Sussex in Great Britain Esq. and that without fraud or further Delay then this obligation to be void and of none effect otherwise to be and remaine in full force and virtue.

TIM<sup>o</sup> SHELLEY [Seal].

Sealed and delivered in the presence of JOHN SHURMUR and THO. NIBBLETT.

MEMORANDUM that on the Twenty-eighth day of May Anno Dom. 1743 personally appeared before me John Cruger Esq<sup>r</sup> Mayor of the City of New York Thomas Nibblett of the same city victualler and made oath upon the Holy Evangelists of Almighty God that he was present and saw the within named Timothy Shelley sign seal and deliver the within written Bond or obligation as his Voluntary Act and Deed and that he the Deponent together with John Shurmur Did at the same time subscribe their names as witnesses thereto.

JOHN CRUGER.

It will be observed that this bond was not recorded until more than seven years after its execution.

The father of Timothy had died in 1739, and, presumably, Timothy had returned to England, taking with him his children John and Bysshe, and had entered upon the enjoyment of the "Estate," at least as guardian of the interests of a lunatic elder brother. The prudent mariner, since he was careful to put it on record, probably as soon as he learned that Timothy had left the colonies, doubtless enforced his bond in England against the Newark merchant, "his heirs, executors, or administrators." It may have been the enforcing of this obligation which created the report that Timothy Shelley had absconded from his creditors on this side of the water, but, reasonably considered, that should not, and no other record does, reflect discredit on his honest dealing in America.

John Malone.

"Southern Womanhood as Affected by the War."

MY circumstances, before and since the war, have enabled me to judge clearly and impartially, I think, of the ability and fairness of the views and conclusions of Dr. Tillett in his important paper in the November CENTURY entitled "Southern Womanhood as Affected by the War." A Southern boy, educated in Pennsylvania, and when a man married to a New York woman, and subsequently the president of one of the most important of the Southern female colleges, I can confirm almost everything on the subject that has been said by the author of the article and the correspondents whom he so freely quotes.

But there is one thing I know, which Dr. Tillett could not know, because he is so much younger a man, and has had his observations almost entirely confined to the South. For instance, he cites the fact that before the war self-support was never thought of by young women of good social standing in the South, and that their male relatives would never have allowed it. Was not that just as true of the North? Since reading the article I have reviewed my recollection of the state of affairs in social life, and I cannot recall a single girl of all my college acquaintances of whom that was not just as true as of the girls I had known in my boyhood in the South. Fifty-three years ago I came to New York, and the same was true of all the young ladies with whom I became acquainted here. Not one pursued studies that had any reference to self-support. I can recall the names of a number of leading families in the city, which then terminated on the north at 14th street. There was not a father in any household I entered who ever expected his daughter to become self-supporting; not a young man who, if the idea had been suggested to him, would not have regarded his sister as forfeiting social position if she had sought to "make her own living." Thirty years ago I first saw England, and the same was to a large extent true of social life there. I am sure that at that time no titled lady would have dreamed of opening a large millinery establishment in Regent street, London.

But now that is all changed. The last quarter of a century has altered woman's relative social condition in all lands, and Southern women have shared the general progress; and it is more remarkable in the South because young women in high social life there occupied a position very nearly that of the daughters of the English aristocracy, though their circumstances were suddenly and startlingly changed by the results of the war.

I can confirm the opinion of the distinguished educator whom Dr. Tillett quotes and whom I think I know. While I was president of the college in North Carolina "I had no pupils preparing for their own support." In 1853 M. W. Dodd, then a publisher whose store was in "Brick Church Chapel," which stood where the "Times" building now stands, published a little book of mine entitled "What Now?" It was an address to my graduating class of that year, a class composed of young ladies, the daughters of wealthy or well-to-do planters and professional men. After the war the American Tract Society desired to republish it, and, in preparing it for the general public of young women just beginning life, the changes I was compelled to make to fit the book for its new mission show

very strikingly the changed condition of young womanhood even then.

Now, as one of Dr. Tillett's correspondents shows, and as I have learned from other sources, the standard of scholarship has been greatly advanced in Southern colleges for women. Now "twenty-five per cent. of the girls look to supporting themselves when they leave college." Of course "they are most earnest and diligent in the prosecution of their studies." It is to be pointed out that two things are resulting from this: (1) that large numbers are pursuing less the ornamental and more the useful studies; (2) that the effect of their better scholarship in both departments is to stimulate powerfully the other students. So while the present generation of Southern girls can never become lovelier than their charming grandmothers, the new order is producing a larger class of better-educated women.

Charles F. Deems.

### The Steering of Yachts.

#### I. A SUGGESTION.

UNDER the heading, the "Evolution of the Modern Yacht," appeared in the "North American Review" for October, 1891, an article over the signature of Lewis Herreshoff, praising the model of the *Gloriana*. Of the form of that craft I have nothing to say either in praise or censure, because I have never seen her. If she can outsail yachts of a different shape, that fact conclusively proves that hers is the better. Only one of the author's points do I wish to criticize. In praising the steering qualities of the *Gloriana* he says:

In vessels of the usual form, when driven by fresh winds the water is piled up against the lee bow, and, owing to the bluff part of the bilge being wholly or partially immersed, the water it displaces forces the bow of the boat strongly to the windward, giving the vessel a tendency to luff, or turn toward the wind. This "luffing" influence of the lee bow must be counteracted by the rudder, resulting in labor for the helmsman and loss of speed for a double reason, the obstruction caused by the piling up of the water of displacement under the lee bow, and the drag on the boat by the rudder, seeing that it must be carried at an abnormal angle to produce the required effect.

If a boat or vessel at any time, whether running free or close to the wind, carries a weather helm, no matter how slight, the tendency in this direction will be increased as the breeze freshens, causing her to careen more and more. It is not difficult to find the reason for this. The farther the vessel lies over on her side, the less becomes the steering-power of her rudder. If we could suppose her to move on after she lay upon her beam-ends, and still have a tendency to turn her bow to the wind, the helm might be placed hard up, but it would be powerless to counteract the luffing influence, because, when in a horizontal position, the rudder has lost all its steering-force, although it is still a drag on the boat.

The rule is the same whether the boat is sailing in rough or smooth water, and whether she has a bluff bow or a sharp one. The scow and the yacht are governed by the same principle; namely, when the rudder is in the nearest to a perpendicular position that it ever gets,—it the stern-post is raking, it will be always somewhat inclined,—it exerts the greatest steering-force; when it reaches a horizontal position, it loses its

capacity to steer altogether; and as it leaves the perpendicular and approaches the horizontal, it steers with diminished power; and, consequently, "must be carried at an abnormal angle" to do its work.

It will be observed that I have been stating the effect of the increased careening of the boat, and the consequent change of the position of the rudder on its steering-power alone. I have not been accounting for the tendency of the boat to luff under certain circumstances, but only for her apparently increased disposition to turn her head to the wind as she lies over on her side more, when the wind freshens, owing to the diminished steering-power of her rudder as it approaches a horizontal position. The main cause of this tendency to luff is the action of the wind on her sails. When the boom of a sloop is swung out to leeward, the influence of the breeze on her mainsail is the same as the finger of the spinner on the spoke of the spinning-wheel, it turns her around toward the wind—gives her a tendency to luff. If, while the sail remains at this angle with the keel, the increase of the breeze causes the boat to careen more, then the rudder loses some of its steering-power, and "must be carried at an abnormal angle to produce the required effect."

A result reached in a "rather obscure but interesting manner" is not quite so profitable as one the causes of which are clearly seen, and hence the above suggestion.

Isaac Delano.

#### II. COMMENTS BY MR. HERRSHOFF.

MR. DELANO has made an excellent beginning in the science of steering by his study of the action of the rudder, but if it be his desire fully to perfect himself in that art, closer observation will be required. The proper office of the rudder, as a factor in steering a sailing-vessel, is to create an equilibrium amongst several opposing forces, so that the desired control may be maintained over the movement of the vessel.

The careful designer seeks so to adjust the various factors that go to make up the proper balance of a yacht that the action of the rudder will be sufficient to counteract any excess that one force may exert over another. The chief thing to be done is to place the center of effort of the sail-area in proper relation to the center of lateral resistance of the hull. This is about all the designer can do; he trusts to the good sense of the master of the vessel to trim his sails properly, and to keep them in as good condition as to fit and setting as possible, all of which has marked influence on steering qualities.

The general proportions of the hull have a direct bearing on facility of steering, and the form also exerts more or less influence in the circle of forces that enter into the problem. Now if these various forces would remain always in the same relation to each other, steering would be easily performed; but with every change in the force of the wind and in the angle of inclination of the hull, new combinations are formed, and even new forces may be set up, so that the problem of steering, which might seem simple when considered as the rudder's work alone, really becomes often difficult and complex. Yachts of the "English type" nearly always carry a lee helm, when sailing close-hauled or slightly free, in fresh breezes; yachts of the old Ameri-

can type, like *Mucilage*, require almost a horse's power to steer them under the same conditions, carrying the while an abnormal weather helm.

When *Gloriana* and *Mineola* were approaching the Spit in the New York Yacht Club regatta last June, the latter yacht became in a measure unmanageable, pushing herself under the lee bow of the former yacht in a troublesome and unusual manner, the *Gloriana* all the while being under absolute control although she carried a heavier press of sail than her opponent.

These and many more circumstances convince me that other influences than merely the action of the rudder enter into the problem of steering, and I must still adhere to my statement made in the "North American Review," in October, 1891, that the perfect steering qualities of *Gloriana* in a great measure are acquired by the peculiar form of her entrance and by her manner of disposing of the water of displacement under her lee bow.

Lewis Herreshoff.

#### The Battle of the "Wyoming" in Japan.

It was with much pleasure I read in the April number of THE CENTURY MAGAZINE the account of the United States Steamship *Wyoming* in the Straits of Shimonoséki, but I regret that the article should be marred even by a single omission or inaccuracy.

If my memory serves me rightly, "Master William Barton" was—at that time Lieutenant William H. Barton. Acting Master John C. Mills should read John C. Wells, of Greenport, Long Island. I regret that the name of our ward-room messmate, an able officer, stanch friend, and popular with all the ship's

officers and crew, has been omitted entirely from the article: namely, Acting Master William Tallman, Jr., of New Bedford. He it was, I believe, who was in command of the "after 11-inch pivot-gun" (not Wells), and therefore, if I am right, to him should be given the credit. Mr. Wells was the navigating officer, and the undersigned at that time was assistant navigating officer and officer in charge of the powder and shell division. It was a hot fight, and every one on board entered into the engagement with a determination to conquer or die. From the nature of our surroundings there could be no skulking, no straggling, no retreat. To be defeated by the overwhelming numbers meant naught but death eventually by the hand of our enemies, a fate much more horrible to contemplate than to meet death amid the heat and smoke of battle.

Mr. Griffis compliments our late commander McDougal and Lieutenant-Commander and Executive Officer Young none too highly, for they truly were men of steel, modest and fearless; heroes in all the world implies.

Walter Pearce,

Late Acting Ensign, U. S. S. "Wyoming."

#### COMMENT.

I THANK Mr. Pearce for calling attention to my unintentional omission of the name of Acting Master William Tallman, Jr., though I was informed by the other officers of the *Wyoming* that Acting Master John C. Wells (which a mistake of the copyist made Mills) was in charge of the after pivot-gun. Master William Barton was not, as he has written me, made lieutenant until some time after the action.

William Elliot Griffis.

## IN LIGHTER VEIN.

Along in June.

*A Summer Series of Prairie Farm Fancies, by Doane Robinson.*

WITH PICTURES BY E. W. KEMBLE.

#### I. MISTER TAPLEY.

ALONG in June  
Sech craps I never seen,  
The wheat stud up above knee-high  
So kind of rich and blue-black green,  
"I ruther calkerlate," sez I,  
"I'll go to town this afternoon  
And buy a bran new bind-machine."

Come night, when Jones sot on the rail  
A-whinin' 'bout the 'tarnal hail  
Thet give the craps a swashin',  
I sez,—a-pickin' up a pail,  
And scoopin' up a bar'l of hail  
To melt fer washin',—  
"Wall, I don't feel half-way so mean  
Es ef I'd bought thet bind-machine."

#### II. HERDING.

No end of rich green medder land  
Spicked out with ever' kind of poseys.  
Es fer es I kin understand  
They's nothin' else on earth so grand  
Es just a field of prairy roseys,  
Mixed up with blue, gold-beaded plumes,  
Of shoestring flowers and peavy blooms.  
Take it a warm, sunshiny day

When prairys stretch so fer away  
Ther lost at last in smokey gray,  
And hulkin' yoke-worn oxen browse  
Aroun' the coteaus with the cows,—  
The tipsey, ctag'r'in' day-old calf  
Mumbles a bleat and slabbers a laugh,—  
And yearlin' steers so round and slick

Wade in the cool and sparklin' crick,  
While cute spring bossies romp and play  
With Ponto, in the tall slough hay,  
Yeh picket out the gentle Roany,

Yer knowin', faithful, herdin' pony,  
And tumblin' down upon yer back  
Wher' gay, sweet-smellin' beauties bide  
In posey beds, three counties wide,  
You take a swig of prairy air,  
With which old speerits kent compare,  
And think, and plan, and twist, and rack  
Yer brains, to work some scheme aroun'  
To git a week to spend in town.

III. PRIDEWEED AND THISTLES.

Prideweed 'n' thistles grew so thick  
The critters would n' pull the plow,—  
The steer was willin', but the plaguy cow  
Objected to the jagger's prick,—  
So I bedeviled *in* the crap.<sup>1</sup>  
Nen swagg'rin' mustard come so quick,  
A-struttin' smart to make a show,  
The crap wa'n't give no lay to grow,  
And when a drouth come down ker-slap  
I see it wa'n't no ust to hoe;  
By harvest-time I come to know  
The toilin' farmer hed no chance,—  
The laws not givin' him a show,—  
So I put on my other pants,  
And quit the farm 'n' squar'-off went  
To jest reform the gover'ment.

IV. THE COMMITTEE.

When school was out along in June,  
About the time the corn laid by,  
We picnicked Friday afternoon.  
And it so come thet Lit 'n' I  
Were all committee.  
We sot the tables where the light  
Leaked through the laughin' leaves and cast  
A silver barley sieve down right  
Where all the posey-pots were spread,  
And chicken pie, and seeded bread,  
And crusted cake, and fust and last  
'Bout ever'thing there is to eat  
Of hearty stuff, and sour and sweet.  
And there was Lity.  
She come from town to teach our school;  
I tuck to her right from the fust,  
But must say I were treated wust  
I ever were. Along with me  
On thet committee I could see  
She 's mad enough to hev a fit.  
But what made me the maddest yit  
Were when thet there confounded mule  
Of beau of her'n—pleg-taked fool—  
Come from ther city.

The kinky, dandy, slinkin' slim,  
I seen her makin' eyes at him.  
But me, committee long with her,  
He got no chance to beau her ther'.  
And when the exhibition come,  
Old Billy Mason played the drum;  
And Lity kind of bossed the show,  
Proddin' the parties up to sing,  
And act, and speak, and kep' the thing  
A-movin' on. Fust Molly Snow  
And Susie Harris  
Come on the stand to wonst and spoke  
The dialog' "Aunt Sally's Joke."  
We never hed a thing so good  
Exhibit in our neighborhood.  
I spoke "Bozzaris."  
They stomped and clapped so I could tell  
I 'd done the thing almighty well.  
But when the teacher spoke a piece,  
The "Maid of Athens," down in Greece,  
We stomped enough to raise the West,  
Me stompin' louder 'n all the rest,  
Nen while th' infant class were singin'

<sup>1</sup> Sowed without first plowing.

## Love-Song.

I sneaked aroun' beside of Lity,  
 Pertendin' how, like I were bringin'  
 Some kind of bizness fer committee,  
 And tho' she 'd mitted me before,  
 And bragged she 'd do it ten times over,  
 I ast her plump " ef she would be  
 So good es to ride home with me ? "

The putiest night I ever seen,—  
 Some sez the like thet does n't mean;  
 But I 've inspected up the words,—  
 My buggy hosses, Prince and Peter,  
 Were chipper es a pair of birds,  
 The sun and moon were on the teeter,—  
 One drappin' down, up bobs the other,—  
 I tell yeh never wuz another  
 Jest sech a night,  
 Ezactly right.  
 My wife agrees along with me,  
 The putiest night she ever see  
 Were thet June evenin' when jest we—  
 Thet 's me and Lity  
 Of the committee—  
 Rid to the city.

Doane Robinson.

O CANADA, sweet Canada,  
 Thou maiden of the frost,  
 From Flattery Cape to Sable Cape  
 With love for thee we 're crossed.  
 We could not love thee less nor more,  
 We love thee clear to Labrador;  
 Why should we longer thus be vexed?  
 Consent, coy one, to be annexed.

O Canada, sweet Canada,  
 Our heart was always true;  
 You know we never really cared  
 For any one but you.  
 Your veins are of the purest gold  
 (We 've mined them some, the truth be told),  
 True wheat are you, spite chaff and scorn,  
 And O, your dainty ears (of corn).

O Canada, sweet Canada,  
 John Bull is much too old  
 For such a winsome lass as you,—  
 Leave him to fuss and scold;  
 Tell him a sister you will be,  
 He loves you not so much as we;  
 Fair maiden, stand not thus perplexed,  
 Come, sweetheart, come and be annexed.

Charles Henry Phelps.

## The Old Covered Bridge.

O THE old covered bridge! sixty years it has stood  
 Like a mother to nourish the town's babyhood  
 With the currents of life that unceasingly flowed  
 Thro' its tunnel along the old National Road,  
 And its moss-covered walls still triumphantly loom,  
 With their history hidden in cobwebs and gloom,  
 Like a grim silent sphinx with the future in view,  
 Or Colossus that spans the old times and the new.

O the old covered bridge! how the years whirl  
 around  
 As I see it once more, and my life is unwound,  
 With its burdens and sorrows laid by, and I seem  
 To be standing again in the sweet happy dream  
 Of my childhood, and watching with innocent glee  
 The birds and the waters that talked there with me,  
 While the trees were live giants and I but a midge,  
 As I lolled on the banks by the old covered bridge.

O the old covered bridge! how I wondered and feared  
 As far, far through its narrow foot-passage I peered,  
 And fancied it led to the end of the world  
 Or some dim distant country in mystery whirled;  
 And I climbed to the rail and gazed dizzily down,  
 At the current with wrinkles of yellow and brown,  
 And I lingered till terror of dusk made me fly  
 And with tears bid the bridge and the river good-by.

O the old covered bridge! may it never decay;  
 May the march of the ages just wear it away,  
 For it marks the proud growth of a city in fame  
 And the third generation still finds it the same;  
 And if ever a flood of the future uprears  
 To tear the old structure by force from its piers  
 May my spirit be with it and, perched on its ridge,  
 Sail away into space with the old covered bridge!

Richard Lew Dawson.

No. 5.

## THE GRAND FALLS OF LABRADOR.

FUGITIVE article relating to a great cataract in Labrador, appeared in several newspapers during the early part of 1891. It referred to the stories current among the Indians and voyageurs which tended to

prove the existence of such a great waterfall on the upper waters of the Grand, or Hamilton, River, and ascribed to it the stupendous height of 1500 feet. This attractive piece of geographical news, with its apparent flavor of aboriginal hyperbole, chanced to catch the eye of the present writer. An examination of the literature relating to Labrador which was accessible revealed the suggestive fact that although it was probably the first part of the mainland of America visited by Europeans, yet, in this last decade of the nineteenth century, one must seek there for the largest unexplored area on the western continent. Many generations of mariners and fishermen have sailed along Labrador's bleak coast, since John Cabot visited those shores in 1497; and all have borne abroad the fame of its arctic climate and desolate seaboard. The uninviting character of its rocky seaboard has thus given a bad name to the whole country, and in this we must find the reason why Labrador has received so little attention from explorers.

A glance at any of the maps of the peninsula which have been published will show them to be very defective specimens of cartography.

None of the maps show the river-systems and lakes with any degree of accuracy. It has long been assumed, however, that the interior contains a great table-land. The highest portion of this elevated region is probably in the southern part of the peninsula, where its greater rivers have their source. The most important of these, the Grand, or Hamilton, River, rises in the lakes on this table-land, and flows in a general southeasterly direction a distance of nearly 400 miles into Hamilton Inlet, the great marine estuary which, under different names, penetrates the interior a distance of 150 miles. No scientific explorer has penetrated far into the country, and the imperfect knowledge of this vast territory (estimated to contain 289,000 square miles) rests entirely on the vague reports of Indians, a few missionaries, and information furnished by some agents of the Hudson Bay Company.

Interesting as these researches were, they yielded but little real information relating to the configuration of the interior. Enough was learned, however, to establish the existence of the Grand Falls, and to show that the time had long since passed when any enterprising traveler could claim the honor of their discovery.

The traditions of the Hudson Bay Company affirm that two officers of the Company visited the spot many years ago. The first of these, John M'Clane, was unquestionably the first white man to gaze upon this remote cataract, which he discovered in the year 1839 while engaged in seeking an inland route between two

posts of the Company. Twenty years after M'Clane's visit, Joseph McPherson was guided to the spot by an Iroquois Indian named Louis-over-the-fire, who is still living, an aged pensioner of the Company, at Northwest River Post. These are the only white men who, previous to the summer of 1891, are known to have seen the Grand Falls. Neither M'Clane nor McPherson measured the height of the Falls, and, in fact, it does not appear that the latter ever gave any account of his visit to this region.

To continue the brief record of Labrador exploration, mention should be made of the journey of Professor H. Y. Hind, who thirty-one years ago started from the Seven Islands, on the St. Lawrence coast, and ascended the

no traveler or trader disturbed the loneliness of this remote wilderness. Fort Nascopie, the only interior post of the Hudson Bay Company, was abandoned some twenty-eight years ago, and the inland trail to it, which passed within fifty miles of the Falls, was disused in the interval. No one endeavored to ascend the Grand River, and the dim tradition of the Falls was almost forgotten. At length, in 1887, a young Englishman, R. F. Holme of Oxford University, journeyed to Labrador and started up the Grand River, having the Falls as the objective point of his expedition. He relied on Professor Hind's statement that the cataract was 100 miles from the mouth of the river, and consequently found himself insufficiently equip-

NORTHWEST RIVER POST. (FROM A PHOTOGRAPH.)

ENGRAVED BY P. AITKEN.

ped for what proved to be a much longer journey. With a boat and two men, he pluckily surmounted the difficulties of river navigation, and reached a point about 140 miles from the mouth of the river, when he was obliged by the failure of his provisions to turn back.

Believing a visit to the Grand Falls presented no insurmountable obstacles, and confident that such a trip would yield interesting geographical results and exciting sport with rod and

Moisic River a distance of 120 miles. Strictly speaking, the territory drained by this affluent of the St. Lawrence is not in Labrador proper, but is embraced by the eastern borders of the province of Quebec. In the account of his explorations Professor Hind first advanced the statement that the interior plateau of Labrador attained a height of over 2200 feet, and this idea has been accepted by most writers on the subject. Then ensued a long period during which

no insurmountable obstacles, and confident that such a trip would yield interesting geographical results and exciting sport with rod and

PART OF THE LOWER OR MUSKRAT FALLS OF THE GRAND RIVER. (FROM A PHOTOGRAPH.)

gun, the writer determined to essay the voyage. Preparations for the journey were made in the early part of June, 1891. The various articles of equipment were gotten together with some care, and included, among other things, a Rushton canoe sixteen feet in length. An associate who entered with enthusiasm into the enterprise was found in Professor C. A. Kenaston, of Washington, D. C., and on June 23 we sailed from New York on the steamship *Portia* for St. John's, Newfoundland, where we arrived on the 29th of the same month. After an unexpected and vexatious delay here of over two weeks, we sailed from St. John's on the small steamship *Curllew*, the boat engaged by the Newfoundland Government to carry the mails on the Labrador coast during the summer. After calling at several ports on the northeastern coast of Newfoundland, our stanch little craft turned north, and, steaming through the dense fogs of the Strait of Belle Isle, soon revealed to our eyes the wild and desolate coast of Labrador. The four-days' sail along this coast proved to be most enjoyable, and formed an impressive introduction to the rugged north-land which was to be the scene of our wanderings. On July 23, the *Curllew* landed us at Rigoulette, in Hamilton Inlet. This is the chief station of the Hudson Bay Company in Labrador, and at the time of our visit was in charge of Chief-factor Bell, a veteran officer of the Company. A small schooner having been placed at our disposal by Mr. Bell, the following day we continued our journey inland, sail-

ing westward for ninety miles through the great interior basin known as Melville or Gross-water Bay.

Northwest River Post, at the head of the bay, where we arrived on July 27, is the most inland station of the Hudson Bay Company, and is the chief trading-point of the Montagnais, or Mountaineer Indians, who make annual visits to this post to meet the Roman Catholic missionary, and to exchange the outcome of their winter's trapping for supplies and ammunition. Many of the Indians had already visited the post and returned to the interior; but a number were still encamped in the neighborhood. A few half-breed "servants" here live in cabins, which cluster about the ancient storehouse of the Company. The Grand River flows into the bay twenty-five miles from here, and at this point preparations were made to ascend that river. Marvelous tales anent the raging rapids and dangers of the river met us at the post; but by securing the aid of a number of Indians and their canoes, we hoped to overcome all these difficulties of inland navigation and gradually to work our way up. A grievous disappointment as to this part of our plans was in store for us. In addition to their natural disinclination to engage in an undertaking involving so much hard work, we found that a superstitious dread of the Grand Falls obtained among the Indians. They believe the place to be the haunt of evil spirits, and assert that death will soon overtake the venturesome mortal who dares to look upon the mysterious cataract.

As is well known, the Eskimos of Labrador dwell on the coast, and seldom venture far into the interior. Hamilton Inlet may be regarded as the southern boundary of their habitat, which stretches north to the shores of Hudson Strait. Contact with civilization seems to lessen the vitality of this interesting race, and the Mora-

lacustrine basins of the northern part of the peninsula, are closely allied to the Mountaineers in language and habits, but are a more hardy and primitive people. Their clothing is entirely composed of reindeer-skins, and many have no intercourse whatever with white men. Numbers of them, however, make annual visits to Fort Chimo, a station of the Hudson Bay Company near Ungava Bay, where, in exchange for their pelts, they obtain flour, ammunition, and a few other articles. We were informed, by one who lived two years at this fort, that the savage custom of killing the old and helpless still prevails among the Nascopies. The victim is not despatched outright, however, but is supplied with sufficient food to last a few days, and is then abandoned to a cruel death by starvation.

Thwarted in our project of Indian coöperation, we nevertheless resolved to make the best of the situation, and our party on starting up the river comprised, besides Professor Kenaston and the writer, John Montague (a strong young Scotchman, well acquainted with the lower part of the river, and the man who had accompanied Mr. Holme in 1887) and Geoffrey Ban, a full-blooded Eskimo, whom we had brought from the coast. Geoffrey was a typical specimen of his race, strong and of stocky build, with a swarthy, Tatar cast of features, and a cheerfulness of disposition which the vicissitudes of

vian missionaries declare that, like the Eskimos of Alaska, they are gradually decreasing in numbers.

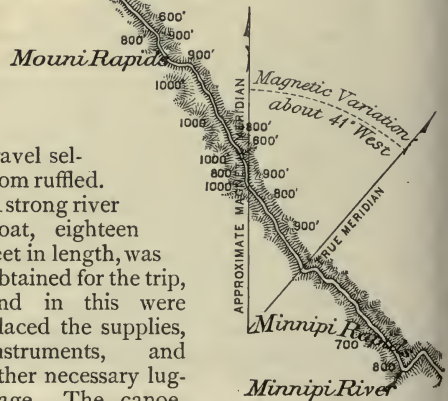

The great wilderness of the interior is the home of the Indians. These belong to the Cree nation of the Northwest, and are divided into two families: the Montagnais, or Mountaineers, who are found as far west as Lake St. John, in the province of Quebec; and the Nascopies, a less numerous tribe, who dwell on the barren grounds extending to the far north.

All the Indians who resort to the trading-post are nominally Roman Catholics; but as the ministrations of the priest extend over a period of only three weeks each year,—during which all marriages and baptisms are solemnized,—there is time in the long interval for many of the precepts of the Church to be forgotten, and for inherent superstition to assert itself. The heathen element is exemplified in the survival of the native medicine-men, or “conjurers” as they are termed, who undoubtedly wield much influence over their followers. The priest exerts himself to lessen the authority of this savage hierarchy; but it is well known that, away from his watchful care, the old barbaric incantations and prophecies are still practised. As a result of their almost complete isolation, these Labrador Indians show but few evidences of contact with white men, and their mode of life and customs present many aspects of interest to the ethnologist. The Nascopies, who dwell about

travel seldom ruffled.

A strong river boat, eighteen feet in length, was obtained for the trip, and in this were placed the supplies, instruments, and other necessary luggage. The canoe, which contained the tent and a few smaller articles, was tied to the stern.

On August 3, our little company of four bade adieu to friends at Northwest River, and we turned our faces toward the wilderness. For two days a favoring wind filled our sail, and on the third day we reached the lower falls of the Grand River, which are called Muskrat Falls by the trappers, and are twenty-five miles from the mouth of the river. Parallel chains of hills here encroach on the bed of the river, contracting

the channel and presenting a granite bulwark through which the stream has forced its way. There are two steps in the descent, and the total drop is seventy feet. To go around this fall, a long and steep "carry" was necessary. The unwieldy character of our boat, which weighed 500 pounds, was here a serious disadvantage. By means of a block and tackle, and with much laborious lifting and pulling, we dragged it up the precipitous banks. This operation and the packing occupied a day and a half. During the subsequent advance of 175 miles up the river, oars and paddles were, for the most part, of little use, owing to the swiftness of the current. The method employed was what is technically known as "tracking"—that is, a strong rope, about the thickness of a clothes-line, was tied to the gunwale of the boat just aft of the bow. To the shore end broad leather straps were attached. With these across their shoulders, three of the party tugged along the rocky bank, while the fourth man, with an oar lashed in the stern, steered a devious course among the rocks and shallows of the river.

In this laborious fashion the advance continued for three weeks. With the exception of a smooth stretch, which Montague called "slack water," the current was almost uniformly swift and the "tracking" of the most arduous character. Sandy terraces, and extended reaches covered with glacial boulders, characterized the lower portion of the river, while farther up-stream great numbers of smaller boulders, insecurely lodged on the precipitous sandy banks, presented a precarious footing to those trudging along the rocky "tow-path." When a combination of this "rubble" and a troublesome rapid occurred, it was only by the most violent exertion, and no end of slipping and sliding, that the tension of the tow-line could be maintained on the treacherous ground. Then again, stretches of steep rocky bank, where no "tracking" was possible, often necessitated scaling the rugged cliffs and passing the line from

undermined the banks, and where numbers of trees, stumps, and underbrush littered the shore and formed *chevaux-de-frise* of the most formidable character.

The popular impression that Labrador possesses a climate which even in summer is too rigorous for the enjoyment of open-air life was not verified on this trip. The temperature during the day was found to be delightful—just cool enough to be stimulating; while the average minimum temperature registered during the forty-two nights of the journey was ascertained to be but 42° Fahrenheit. Nor was verdure lacking in this subarctic landscape, for dense growths of spruce and fir extended back for miles into the blue distance, and even where fire had blackened the slopes of adjacent hills, the somber aspect of the scene was much relieved by a second growth, which showed the delicate green of its leaves among the charred remains of the original forest. Game and fish proved to be fairly abundant, and two fine black bears were killed by members of the party. The fresh meat thus obtained, together with the trout captured from time to time, made welcome variations in the dietary of the expedition.

The declining sun of August 20 beheld our small craft glide into the smooth waters of Lake Wanockalow. The first view of the lake was beautiful, and most grateful to our eyes after the long struggle with the rapids. Even Geoffrey and John, usually indifferent to scenic effects, could not conceal their admiration as we glided by towering cliffs and wooded headlands, and beheld at intervals cascades leaping from the rocks into the lake, their silvery outlines glistening in the sun and contrasting distinctly with the environment of dark evergreen foliage.

This romantic sheet of water stretches in a northeasterly and southwesterly direction for about thirty-five miles, and has an elevation above sea-level, according to the aneroid observations secured, of 473 feet. Low mountains

one to another over various obstacles. Wading through the water was frequently the only resource. This was always in order when a place was encountered where the spring freshets had

of granite and gneiss rise on each side, and the average width of the lake is less than one mile. A sounding taken near the middle showed a depth of 406 feet. This narrow elevated basin

is undoubtedly of glacial origin, the presence of great numbers of boulders, and the rounded appearance of the hill-summits, pointing to a period of ice-movement. We made a good run up the lake, passing the farthest point reached by Mr. Holme in 1887, and camped on the river-bank three miles above the lake, opposite the mouth of the Elizabeth River, which here enters the Grand from the northwest. The next day we rested in camp; taking occasion to overhaul the boat and canoe and repair clothing and outfit, preparatory to entering the terra incognita which lay before us.

Four days after passing Lake Wanockalow, a wide shallow rapid was encountered, over which it was impossible to drag the boat. Finding no possible channel in the river, we judged we were in the neighborhood of the "Big Hill," the head of canoe navigation, and the point where, in the old days, when the Hudson Bay Company sent crews to their inland post, the Indian voyageurs left the river. From an Indian we had learned that the old trail, long disused, led from this point on the river to a chain of lakes on the table-land. By following these lakes and crossing the intervening "carries," the rapid water which extends for twenty-five miles below the Falls could be avoided, and the traveler be brought finally to the waters of the Grand River many miles above Grand

Falls. Our plan was to follow this old trail for several days, and then to leave the canoe and strike across country in a direction which we hoped would bring us again to the river in the vicinity of the Falls. It was deemed best to follow this circuitous canoe-route rather than to attempt to follow the banks of the river on foot, in which case everything would have to be carried on our backs for many miles through dense forests.

After a long search the old trail was found, and leaving Geoffrey in charge of the main camp on the river, the rest of us took the canoe and a week's provisions, and began the ascent of the steep path which led to the edge of the elevated plateau, which here approaches the river. In three days six lakes and the intervening portages were crossed. Arriving at the sixth lake, which was larger than the others, we turned aside from the dim trail and paddled to its northwestern extremity, where we drew out the canoe and prepared for the tramp toward the river. Arrayed in heavy marching order, and carrying almost all that remained of the provisions, we were soon advancing in a westerly direction. We were now on the table-land of the Labrador interior, and the country we were passing through was of the most desolate character, denuded of trees, the surface covered with caribou-moss, Labrador tea-

plants, blueberry-bushes, and thousands of boulders. By keeping to the ridges, fair progress was made; but when compelled to leave the higher ground and skirt the borders of the lakes, dense thickets of alders and willows were encountered, and these greatly impeded our advance. The desolation of this upland landscape is indescribable. No living thing was encountered, and the silence of primordial time reigned supreme. Just before sunset we went into camp on a hillside near a large lake, and soon after, from the top of a high rock, beheld a great column of mist rising like smoke against the western sky. This, we knew, marked the position of the Falls, and, needless to say, our spirits rose — oblivious of our bleak surroundings — as we contemplated the near attainment of our journey's end. During the night the thermometer registered a minimum tempera-

of falling waters was borne to our ears with growing distinctness. After what seemed an intolerable length of time, — so great was our eagerness, — a space of light in the trees ahead made known the presence of the river. Quickening our steps, we pushed on, and with beating hearts emerged from the forest near the spot where the river plunged into the chasm with a deafening roar.

A single glance showed that we had before us one of the greatest waterfalls in the world. Standing on the rocky brink of the chasm, a wild and tumultuous scene lay before us, a scene possessing elements of sublimity, and with details not to be apprehended in the first moments of wondering contemplation. Far upstream one beheld the surging, fleecy waters and tempestuous billows, dashing high their crests of foam, all forced onward with resistless

RAPIDS ABOVE THE GRAND FALLS. (FROM A PHOTOGRAPH TAKEN 250 FEET ABOVE THE BRINK.)

ture of  $41^{\circ}$ , and we were treated to a superb display of northern lights.

September 2 was a memorable day, as it marked the date of our arrival at Grand Falls. A rough march over the rocks and bogs intervened. As we approached the river, spruce forests of a heavier growth appeared, and pressing through these, although we could no longer see the overhanging mist, the deep roar

power toward the steep rock whence they took their wild leap into the deep pool below. Turning to the very brink and looking over, we gazed into a world of mists and mighty reverberations. Here the exquisite colors of the rainbow fascinated the eye, and majestic sounds of falling waters continued the pæan of the ages. Below and beyond the seething caldron the river appeared, pursuing its turbulent ca-

CROSS VIEW OF THE RAPIDS NEAR THE BRINK OF THE GRAND FALLS. (FROM A PHOTOGRAPH.)

reer past frowning cliffs, and over miles of rapids, where it heard "no sound save its own dashings." The babel of waters made conversation a matter of difficulty, and, after a mute exchange of congratulations, we turned our attention to examining the river in detail above and below the Falls.

A mile above the main leap, the river is a noble stream nearly 300 yards wide, already flowing at an accelerated speed. Four rapids, marking successive depressions in the river-bed, intervene between this point and the Falls. At the first rapid the width of the stream is not more than 175 yards. From there it rapidly contracts until it reaches a point above the escarpment proper, where the entire column of fleecy water is compressed within rocky banks not more than 50 yards apart. Here the effect of resistless power is extremely fine. The maddened waters, sweeping downward with terrific force, rise in great surging billows high above the encompassing banks ere they finally hurl themselves into the gulf below. A great pillar of mist rises from the spot. An immense volume of water precipitates itself over the rocky ledge, and under favorable conditions the roar of the cataract can be heard for twenty miles. Below the Falls, the river, turning to the southeast, pursues its maddened career for twenty-five miles, shut in by vertical cliffs of gneissic rock

which rise in places to a height of 400 feet. Above and below the Falls the rocky banks are thickly wooded with fir and spruce, among which the graceful form of the white birch appears in places.

While Professor Kenaston and Montague were making a direct measurement of the principal fall, which proved to be 316 feet, an incident occurred which illustrated the cool daring of the latter in a striking manner. The water, at the time of our visit, was probably as low as it ever is in the Grand River. In fact, from the debris lodged high up on the banks, we judged the stream had fallen at least ten feet from the high-water mark of the spring freshets. This drop in the river left exposed a considerable surface of the rocky ledge which is usually covered by water, forming part of the brink of the fall. After measuring the length of the preliminary incline leading to the main leap, Montague was directed to cast the plummet-line over the rocky edge of the escarpment, in order to secure a measurement of the principal fall. This was done; but while Professor Kenaston was paying out the line, it caught in a slight crevice, and to complete the measurement it became necessary to free it at once. Without a moment's hesitation, our brave John clambered down the steep bank and walked out on the very brink of the Falls,

where, stooping down, with the spray of the passing flood wetting his cheek, he loosened the line, and returned to the bank in safety. A single misstep, or the slightest giddiness on his part, while on that dizzy height would have resulted tragically. But to think was to act with this hardy Scotchman, and, truly, his

the cañon. This I found to be a hazardous and exciting undertaking. Walking along the edge of the gorge just below the Falls, two places seemed to offer possible means of access to the river below. At both points I attempted the descent, only to find, after lowering myself from tree to tree down the bank, that a sheer

AT THE BRINK OF THE GRAND FALLS, SHOWING THE CREST OF THE INCLINE. (FROM A PHOTOGRAPH.)

cool head and nerve served him well on this occasion.<sup>1</sup>

While these direct measurements were being made, I turned my attention to obtaining a number of photographs of the Falls and rapids, and then to securing barometric readings above and below the cataract. In order to obtain an observation at the lower bed of the river, it was necessary to descend the steep walls of

precipice extended the remaining fifty or seventy-five feet to the surface of the water. On the third trial, by following the course of a tiny streamlet, the bed of the river was finally reached. By this time the day was far spent, and darkness almost enveloped the scene down in that imprisoned channel-bed. The situation was interesting, and filled with the charm of a first glimpse into one of nature's solitudes.

<sup>1</sup> At St. John's, Newfoundland, we had provided ourselves with several balls of stout linen cord with which to measure the height of the fall, if the situation should be found suitable. Fortunately, alongside the chute just above the brink of the main cataract, we found a floor of rock of the same slope, about 30° below the horizontal. Along this it was possible to go, but with some peril, nearly to the edge over which the stream plunges in its final descent. Fastening a heavy billet of green fir to one end of the cord, the weight was carried and thrown down on the surface of the rock to the brink of the fall, the cord being paid out from the upper end of the slope. A knot was made in the cord to mark the distance to the edge, and the billet was allowed to fall over the precipice into the chasm. Montague, having climbed along the bank at the edge of the cañon, was holding on by the trunk of a

tree, from which he could see when the block of wood struck the water below as the cord was paid out by me above. The instant of contact was plainly visible to him, and I was equally sensible of it. The cord was now drawn up over the edge and carefully measured with a tape-line. The whole length paid out was 505 feet, the part which measured the slope was 189 feet, leaving for the height of the main fall below the chute 316 feet. Allowing for a few degrees deviation from the perpendicular, and for a slight stretching of the cord, though this last was probably counteracted by wetting, the height of the fall may be considered something more than 300 feet. The vertical height of the chute, about 32 feet, added to the other measurement, makes the descent from the head of the chute to the surface of the water in the chasm about 348 feet.—C. A. KENASTON.

In front, the great river roaring hoarsely in the gloom, and just entering on its final journey over miles of rapids to the sea. On the opposite bank, a splendid cliff of pinkish hue led the eye from the gloomy base, in one long sweep of hundreds of feet aloft, to the utmost pinnacle, which still glowed a few brief moments in the departing rays of the sun. Darkness had settled over all when I clambered over the edge above and made my way through the forest to the camp, just above the Falls. My long absence had alarmed my companions, who welcomed my appearance within the circle of the camp-fire with expressions of relief. It was after nine o'clock when I sat down to a frugal supper that night, somewhat foot-sore and weary after the stirring events of the day.

The difficulties of obtaining near views of large masses of falling water are admitted by all photographers. In the case of the Grand Falls, these were increased by the character of the surroundings. The great volume of water, compressed as it is, and discharging itself through a funnel-like channel in the rocks, falls in a thick, narrow column a distance of 316 feet, sending up banks of vapor and presenting the appearance from a distance of a great pillar of cloud. The vegetation is affected by this vapory condition of the atmosphere, and thin patches of green moss, unlike anything seen elsewhere, were conspicuous on the face of the cliffs just below the Falls. Notwithstanding the apparent futility of the attempt, I endeavored to obtain two views looking across the main leap, from the bank near the brink. These negatives proved to be failures on development. By descending the bank as far as the steep incline permitted, and hanging to the roots of the dwarf fir-trees growing thereabout, I was able, by watching for a favorable moment when the veil of mist lightened, to secure a near view of part of the main leap. It was apparent that the best vantage-ground for viewing the face of the fall was from a point where the cañon wall jutted out a short distance into the deep pool below the Falls. This point of view I estimated was from 140 to 160 feet from the column of descending water, and down its rocky edge one could not creep more than fifteen feet before encountering an almost vertical wall which led to the river-bed below. While the rising vapor did not envelop us here as when nearer the brink, yet the effect of it, rising in banks from the base, while not displeasing to the eye, detracted somewhat from the fine sweep of the fall, the outline of which we could see descending behind the veil of mist. While on this rocky buttress, I took a photograph of the Falls, and one of the lower part of the Falls, showing the mist rising from the bottom, both of which proved to be almost total failures. To explain further

the lack of definition in those photographs, I will add that the afternoon was far advanced and the light far from good. The sun was already well down in the western sky,—across the river from me,—and in the worst possible position for my purpose. I emphasize this feature of the occasion, because it materially affected the result; for had the sun shone from the south instead of the west, I think it would have been quite possible to secure a view giving at least the outline of the Falls.

In my descent to the bottom of the cañon I carried my camera, but I was unable to obtain a view of the fall from the lower bed of the river, because a projecting point of rock several hundred yards up-stream cut off a distant view of the spectacle. The steep walls of the gorge, against which the water dashed in places, prevented any considerable advance up-stream, and I was reluctantly compelled to abandon my purpose of returning the following morning to secure photographs of the Falls from this lower position.

I felt at the time that while the views of the rapids and cañon promised well, those of the Falls could not be other than unsatisfactory. I consoled myself, however, by the thought that the light of the following morning would prove more propitious. Great was my disappointment, then, when September 3 dawned a dull and threatening day. Friends have naively remarked, when I expressed my regret at not obtaining a good view of the main fall, "Why did you not remain encamped at the Falls until you had secured satisfactory photographs of this most important object?" Our provisions were all but exhausted, only enough remaining after breakfast for two scant meals. To have remained under the circumstances seemed to risk starvation, for owing to the absence of all game from the vicinity there appeared to be no means of eking out our supplies by the usual devices of the woodsman. Thus I decided to delay no longer for clear weather; and the two days' storm which supervened proved, I think, my wisdom in declining to take the risk.

The deep incessant roar of the cataract that night was our lullaby as, stretched out under a rough "barricade," we glided into that realm of forgetfulness where even surroundings strange as ours counted as naught. By the morning light we again viewed the wonders of the place, and sought for some sign of the presence of bird or animal in the vicinity; but not a track, or the glint of a bird's wing, rewarded our quest, and this avoidance of the place by the wild creatures of the forest seemed to add a new element of severity to the eternal loneliness of the spot.

The Grand Falls of Labrador are nearly twice as high as Niagara, and are inferior to

VIEW OF THE GRAND FALLS, FROM THE PROJECTION OF ROCK BELOW. (BASED ON AN IMPERFECT PHOTOGRAPH.)

that marvelous cataract in breadth and volume of water only. One of their most striking characteristics is the astonishing leap into space which the torrent makes in discharging itself over its rocky barrier. From the description given of the rapid drop in the river-bed and the coincident narrowing of the channel, one can easily understand that the cumulative energy expended in this final leap of the pent-up waters is truly titanic. If a substratum of softer rock existed here, as at Niagara, a similar "Cave of the Winds" would enable one to penetrate a considerable distance beneath the fall. The uniform structure of the rock, however, pre-

vents any unequal disintegration, and thus the overarching sheet of water covers a nearly perpendicular wall, the base of which is washed by the waters of the lower river. In spite of the fact that no creature, except one with wings, could hope to penetrate this subaqueous chamber, the place is inhabited, if we are to believe the traditions of the Labrador Indians. Many years ago, so runs the tale, two Indian maidens gathering firewood near the Falls were enticed to the brink and drawn over by the evil spirit of the place. During the long years since then, these unfortunates have been condemned to dwell beneath the fall and forced to toil daily,

THE CAÑON, A QUARTER OF A MILE BELOW THE GRAND FALLS. (FROM A PHOTOGRAPH.)

dressing deerskins, until now, no longer young and beautiful, they can be seen betimes through the mist, trailing their white hair behind them and stretching out shriveled arms toward any mortal who ventures to visit the confines of their mystic dwelling-place. The Indian name for the Grand Falls — Patses-che-wan — means "The Narrow Place where the Water Falls." Like the native word Niagara, — "Thunder of Waters," — this Indian designation contains a poetic and descriptive quality which it would be hard to improve.

<sup>1</sup> After my departure for Labrador, I learned of another American expedition which proposed to visit the region of the Grand Falls during the summer of 1891. This enterprise, known as the Bowdoin College Labrador Expedition, under the leadership of Professor Leslie A. Lee, arrived at Rigoulette shortly after Professor Kenaston and myself. But owing to our delay in securing a crew and transportation inland, the four mem-

bers of the Bowdoin party who were despatched to visit the Falls reached the mouth of the Grand River first, and started on their journey up-stream a week in advance of us. The remainder of the Bowdoin students cruised along the coast in their schooner while their comrades were up the river. By the upsetting of one of their two boats, and the loss of provisions, instruments, etc., W. R. Smith and E. B. Young were

From the point where the river leaves the plateau and plunges into the deep pool below the Falls, its course for twenty-five miles is through one of the most remarkable cañons in the world. From the appearance of the sides of this gorge, and the zigzag line of the river, the indications are that the stream has slowly forced a channel through this rocky chasm, cutting its way back, foot by foot, from the edge of the plateau to the present position of the Falls. Recent investigators estimate that a period of six thousand years was required to form the gorge below Niagara Falls; or, in other words, that it has taken that length of time for the Falls to recede from their former position at Queenstown Heights to their present location. If it has taken this length of time for Niagara Falls to recede a distance of seven miles by the erosive power of the water acting on a soft shale rock supporting a stratum of limestone, the immensity of time involved by assuming that the Grand River cañon was formed in the same way is so great that the mind falters in contemplating it, especially when it is recognized that the escarpment of the Grand Falls is of hard gneiss rock. And yet no other explanation of the origin of this gorge is acceptable, unless, indeed, we can assume that at some former time a fissure occurred in the earth's crust as a result of igneous agencies, and that this fissure ran in a line identical with the present course of the river; in which case the drainage of the table-land, emptying into the Grand River, would follow the line of least resistance, and in the course of time excavate the fissure into the present proportions of the gorge.

The highest point reached by the expedition was in the vicinity of the Falls, where, according to the aneroid observations obtained, an elevation something in excess of 1500 feet was noted. Accepting the fact that results obtained by the aneroid barometer are not regarded as conclusive by careful observers, it is nevertheless apparent that the altitudes obtained can be taken as at least approximately correct, especially when it is borne in mind that a standard instrument was used, and corrections for temperature made in every instance. Thus it would appear that the generally accepted idea that the interior table-land of Labrador attains a

general elevation of over 2000 feet is erroneous, and future travelers will be called on to confirm or reject this important point relating to the configuration of the interior.

Having accomplished the main object of the trip, we set out on our return from this distant end of the expedition. A cold rain poured down during the first day's tramp across the barren plateau, and owing to a mistake in the course taken, we missed our former track, and became entangled in a lacustrine region, where we wandered for hours, unable to make any headway among the encompassing lakes. In the humid air landmarks became indistinct, and plunging on through bogs and over sharp rocks, cold, wet, and wearied with the weight of our packs, and with only enough flour remaining for one meal, our condition was unpleasant in the extreme. But dismal thoughts of being lost in this "great and terrible wilderness" incited us to unusual efforts, and at length, by making a long detour, a slight eminence was gained from which we could pick out a course in the desired direction. The storm, accompanied by lightning and thunder, continued during the night, and the most comfortless evening of the entire trip was passed on the bleak shores of a lake on this cheerless table-land. In the course of the following day we regained the canoe, and returning through the chain of lakes by the route previously used, we arrived in due time at the camp on the river, where Geoffrey was awaiting our return with some anxiety. Our trials were almost ended when we reached the river, and having embarked on it, the swift current carried us down-stream with exhilarating speed. Delaying only long enough to make a compass survey of the stream, in seven days the mouth of the river was reached without serious mishap.

A series of fierce gales detained us a week at Northwest River, and we did not arrive at Rigoulette until September 22. Sailing thence in a schooner, we soon reached Indian Harbor, a fishing-station on the coast, where we had the rare good fortune to secure passage on a Norwegian steamship, which brought us to St. John's, Newfoundland. From this point we took the regular passenger-steamer to New York city, where we arrived on October 15, thus completing a journey of over 4000 miles.

*Henry G. Bryant.*

obliged to turn back. The two remaining members of the party, Austin Cary and D. M. Cole, advanced up the river in their boat to a point about ten miles above the "Big Hill," where we turned off for the interior plateau. From there they followed the bank of the river as closely as the nature of the country permitted, until they reached the Falls. They did not measure the height of the cataract. They are entitled to praise for their pluck in overcoming obstacles in their advance up the river, and for their courage and endurance on the retreat; for owing to the spreading of their camp-

fire, they lost camp, boat, and outfit, which rendered their escape down the river an experience of great hardship. Mr. Cary, in a letter to the writer, says: "We were given but thirty days from the vessel. . . . We were compelled to travel up to the limit of our strength, and leave scientific matters to the return trip; and then on the return trip it was all we could do to carry ourselves out of the country." Mr. Cary's account of his experiences was printed in a recent number of the "Bulletin of the American Geographical Society."—H. G. B.

## ANTONÍN DVOŘÁK.

HE coming of Antonín Dvořák<sup>1</sup> to be director of the National Conservatory of Music is an episode in the history of musical culture in America which has unusual elements of interest. In

the story of his life there is a tinge of romance which makes its perusal peculiarly delightful in this age of high average talent and prosaic plodding. It is a story of manifest destiny, of signal triumph over obstacle and discouraging environment. To rehearse it stimulates hope, reanimates ambition, and helps to keep alive popular belief in the reality of that precious attribute the name of which seems almost to have dropped out of the current musical vocabulary. Never in the history of the art did the critic of contemporary music have so little use for the word genius as he has had since the death of Chopin.

In Dvořák and his works is to be found a twofold encouragement for the group of native musicians whose accomplishments of late have seemed to herald the rise of a school of American composers. The eminent Bohemian has not only won his way to the exalted position which he occupies by an exercise of traits of mind and character that have always been peculiarly the admiration of American manhood, but he has also placed himself at the head (or if not at the head, then at least in the front rank) of the nationalists in music. I do not like the term, but I cannot think of a better. Dvořák's example turns attention again to the wealth of material which lies, never yet thoroughly assayed, scarcely touched indeed, in the vast mines of folk-music. The significance of his compositions lies in their blending together of popular elements and classical forms. These forms were as romantic, as free, in their origin as the people's songs and dances; and in the hands of genius they will always remain pliant and plastic, in spite of the operations of that too zealous conservatism which masquerades as classicism.

There is measureless comfort in the prospect which the example of Dvořák has opened up. It promises freshness and forcefulness of melodic, harmonic, and rhythmic contents, and newness and variety in the vehicles of utterance. It drives away the bugaboo of formlessness, which for so long a time has frightened the souls

of fearful conservatives, by pointing the way to a multifarious development of forms. For the present the analysts will be obliged to label the new contents and the new vessels, but that will not matter. The phrase that music is a cosmopolite owing allegiance to no people and no tongue is become trite. It should not be misunderstood. Like tragedy in its highest conception, music is of all times and all peoples; but the more clearly the world comes to recognize how deep and intimate are the springs from which the emotional element in music flows, the more fully will it recognize that originality and power in the composer rest upon the use of dialects and idioms which are national or racial in origin and structure.

The fate which gave the world a composer of music robbed Bohemia of a butcher. Franz Dvořák, the father of Antonín, was the village butcher and innkeeper at Nelahozeves (Mühlhausen), and his ambition touching his son, who was born on September 8, 1841, ran no higher than to bring him up so that he might take his place in what seemed the natural line of succession. In forming this resolve, which was broken down only after a long struggle, the father showed no appreciation of the extent and character of his son's musical gifts; yet in this he was scarcely blameworthy. A love for music, and a certain aptitude in the practice of the art, are the birthright of every Bohemian. "I had frequently been told," wrote Dr. Burney over a century ago, "that the Bohemians were the most musical people of Germany, or perhaps of all Europe; and an eminent German composer, now in London, had declared to me that if they enjoyed the same advantages as the Italians they would excel them." The great historian was skeptical in the premises, being convinced that "nature, though often partial to individuals in her distribution of genius and talents, is never so to a whole people," and being unable to account for climate (the influence of which in the direction indicated he was ready to confess) operating more in favor of music upon the Bohemians than on their neighbors, the Saxons and Moravians. Nevertheless, soon after his arrival in the country he was privileged to discover one cause of the preëminence of the Bohemians in music. At Czaulan he found a school full of "little children of both sexes, from six to ten or eleven years old, who

<sup>1</sup> The Bohemian language contains a sibilated *r*, the modification of the usual sound being indicated by the accent over the letter, as in the composer's name. The

effect of the accent is to cause the *r* to be pronounced like the German letters "rsch." The name is therefore to be pronounced "Dvorschak."

were reading, writing, playing on violins, hautboys, bassoons, and other instruments." After that it was easy for him to understand how the nobility of the country could maintain orchestras in their houses. In keeping servants it was impossible to do otherwise, "as all the children of the peasants and tradespeople in every town and village throughout the kingdom of Bohemia are taught music at the common reading-schools, except in Prague, where, indeed, it is no part of school learning, the musicians being brought thither from the country."

It was the village schoolmaster at Nelahozevs who taught Dvořák to play the violin and to sing, probably with no greater expectations than those aroused by scores of the boy's schoolmates, though it was noted afterward that Antonín had betrayed more than common interest when the itinerant musicians enlivened the church holidays by playing at his father's inn. Before the lad was twelve years old he himself could take a hand with the peripatetic fiddlers and blowers. In 1853 he was sent to school at Zlonitz, where an organist taught him a little theory and introduced his hand to the keyboards of the pianoforte and organ. This instruction endured two years, when his father, who meanwhile had transferred his residence to Zlonitz, sent him to a more advanced school at Kamnitz, where his mind was to receive its final polish, and where, in particular, he was to acquire the German language in obedience to the law of the land. Unlike his musical studies, this was not a labor of love. Dvořák had inherited all the fierce hatred which the Czechs feel for the Germans, and even to-day necessity alone can persuade him to speak or write the German tongue. His cantata "The Spectre's Bride" and his oratorio "St. Ludmilla" were composed to Bohemian words, which were then translated into German, and from the German into English.

It was while he was at Kamnitz that he first became ambitious to exhibit his skill as a composer. It may be that a very obvious and laudable aim was behind a surprise which he prepared for his father after he had been studying a year with Organist Hancke. He had not yet won his father's consent to follow music-making rather than sausage-making for a living. Returned to the paternal inn with its *obligato* abattoir at Zlonitz, he surprised his father by producing the orchestral score of a polka, which he proudly placed in the hands of the convenient band for performance. It was indeed a surprise. Instead of the expected harmonies, the young composer's ears were assaulted by fearful discords, due to the circumstance that the trumpets played a fourth higher than the harmony permitted. Trumpets are transposing instruments, but Antonín did not know that

fact, and had written his music for them in the key that he expected to hear. This unhappy experiment, though it may not have caused any embarrassment, at least did not help him to beat down his father's stubborn opposition to his adoption of music as a profession, and it was a long time before he gained permission to go to Prague and enter the organ-school maintained by the Society for Ecclesiastical Music. The permission, when it came, brought with it little guarantee of financial support, and for three years after he entered the school in October, 1857, he kept himself alive by playing the viola in a band of eighteen or twenty men who regaled the frequenters of cafés and other public resorts with popular dances, potpourris, and overtures. In this way he earned twenty-two florins a month (about \$9), adding something to this sum by playing with the bandmaster in sextets at an insane asylum, where his knowledge of the organ also found occupation. As yet he had never had an opportunity to study the scores of the masters or to hear an opera. On one memorable occasion four cents would have bought him the privilege of hearing "Der Freischütz" from the cheapest place in the opera-house; but the sum was more than he had in his pockets, and an effort to borrow resulted in failure. It was not until he became a member of a theatrical orchestra that he made the acquaintance of operatic literature beyond the overtures and potpourris which were the stock-in-trade of the popular bands. Concerts of the better class he managed to hear occasionally by slipping into the orchestra and hiding behind the drums.

In 1862 a Bohemian theater was opened in Prague, and the band to which Dvořák belonged was hired to furnish the music. It was a modest undertaking, but it made a powerful appeal to the patriotic feeling of the Czechs, and in time was developed into the National Theater. The change was a welcome stepping-stone for the budding musician. With some of his associates he was drafted into the larger orchestra of the greater institution. He now made the acquaintance of Karl Bendl, a popular and admirable composer, who placed in his hands the scores of Beethoven's septet and the quartets of Onslow, and thus opened the door of the classics to him. How great a stimulus to his zeal, industry, and ambition these scores were, can only be imagined. He began at once to compose in the higher forms, producing a quintet for strings in 1862, finishing two symphonies before 1865, and trying his 'prentice hand on an opera. But these compositions all went into his desk; he did not venture before the public until 1873, when, having received an appointment as organist at St. Adalbert's Church, he quit playing in the theatrical or-

chestra, took unto himself a wife, and celebrated his good fortune by writing the music for a cantata entitled "The Heirs of the White Mountains." The subject was patriotic, and the markedly national characteristics of the music won for the cantata prompt and hearty recognition in Prague. It was followed in 1874 by a symphony in E flat, two nocturnes for orchestra, and a scherzo for a symphony in D minor. Prague, which has ever been prompt to recognize genius (as witness that episode in Mozart's life which flowered in "Don Giovanni"), now saw in the young man of thirty-three a possible peer of Gyrowetz, Wanhal, Dionys Weber, Wratiszky, Duschek, Ambros, Dreyschock, Kalliwoda, Kittl, Moscheles, Napravnik, Neswadba, Smetana, Skroup, and other favorite sons, and the National Theater commissioned him to compose an opera.

Not long before, Wagner had been in Prague, and Dvořák had become, as he says, "perfectly crazy about him," following him through the streets to catch occasional glimpses of "the great little man's face." More than this, Dvořák had just heard "Die Meistersinger." Under such influences he wrote the music of "The King and the Collier," and produced a score which on rehearsal everybody about the theater agreed in pronouncing to be utterly impracticable. It could not be sung, and was abandoned until 1875, when Dvořák took the book up again and composed it afresh, giving himself up wholly to the current of his own ideas, and making no effort to imitate the manner of Wagner. He had learned that it was given to but one to bend the bow of Ulysses. In its new musical garb the opera was performed, and again popular favor was won by the national tinge in the music and by its elemental strength.

The time had now come for the Czech to show himself to the world. In the control of the Austrian Ministry of Education (*Kultusministerium*) there is a fund for the encouragement of musical composers. This is doled out in stipends, the merit of applicants being passed on by a commission appointed for the purpose. Dvořák sent to Vienna a symphony and his opera, and received a grant of \$160. The next year he applied again, and though his thesis consisted of his now celebrated "Stabat Mater" and a new opera, "Wanda," nothing came of the application. On a third trial, which was supported by the book of vocal duets called "Sounds from Moravia" ("Klänge aus Mähren") and other compositions, the commission, which now consisted of Johannes Brahms, Johann Herbeck, and Dr. Edward Hanslick, recommended a grant of \$240. More valuable than the stipend, however, was the interest which his music had awakened in Brahms and Hanslick. The latter sent offi-

cial notification of the action of the commission, which the former supplemented with a personal letter in which he informed the ambitious composer that he had advised Simrock to print some of his compositions. An invitation came from the Berlin publisher soon after, Dvořák composed a set of Slavonic dances as piano-forte duets, the dances soon after found their way into the concert-rooms of Berlin, London, and New York (Theodore Thomas brought them forward in the latter city in the winter of 1879-80), and the name of Dvořák became known to the musical world. It was reserved, however, for the composition which the Austrian Commission had ignored to lift him to the height of popularity and fame. On March 10, 1883, the London Musical Society performed his "Stabat Mater." The work created a veritable sensation, which was intensified by a repetition under the direction of the composer three days later, and a performance at the Worcester festival in 1884. He now became the prophet of the English choral festivals. For Birmingham, in 1885, he composed "The Spectre's Bride"; for Leeds, in 1886, "St. Ludmilla"; for Birmingham, in 1891, the "Requiem Mass," which last work was produced in New York and Cincinnati within six months of its first performance in England. Meanwhile two or three of his symphonies, his symphonic variations for orchestra, scherzo capriccioso, dramatic overture "Husitská," and his Slavonic dances have become prime favorites with the audiences for whom Mr. Seidl caters in New York, Mr. Nikisch in Boston, and Mr. Thomas in Chicago. Last year the composer who had not four cents in his pocket to buy admission to "Der Freischütz" thirty years ago, and who was glad to accept a stipend of \$160 from the Austrian government less than twenty years ago, signed a contract to perform the functions of Director of the National Conservatory of Music for three years at a salary of \$15,000 a year.

The forcefulness and freshness of Dvořák's music come primarily from his use of dialects and idioms derived from the folk-music of the Czechs. This music is first cousin to that of Russia and Poland, and the significance of the phenomenon that Dvořák presents is increased by the rapid rise of the Muscovite school of composers exemplified in Tschaikowsky, Rimsky-Korsakow, and Cui. Ever since the beginning of the Romantic movement the influence of folk-music has been felt, but never in the degree that it is felt now. Haydn, Beethoven, and Schubert made use of Hungarian melodies, but none of them was able to handle their characteristic elements in such a manner as to make them the vital part of their compositions. Something of the spiritual essence

# THE NATURE AND ELEMENTS OF POETRY.<sup>1</sup>

## VII. IMAGINATION.

It is worth while to reflect for a moment upon the characteristics of recent poetry. Take, for example, the verse of our language produced during the laureateship of Tennyson, and since the rise, let us

say, of Longfellow and his American compeers.

In much of this composition you detect an artistic convergence of form, sound, and color—a nice adjustment of parts, a sense of craftsmanship, quite unusual in the impetuous Georgian revival—certainly not displayed by any poets of that time except those among whom Keats was the paragon and Leigh Hunt the propagandist. You find a vocabulary far more elaborate than that from which Keats wrought his simple and perfected beauty. The conscious refinement of our minor lyrists is in strong contrast with the primitive method of their romantic predecessors. Some of our verse, from “Woodnotes” and “In Memoriam” and “Fershtah’s Fancies” down, is charged with wholesome and often subtle thought. There has been a marked idyllic picturesqueness, besides a variety of classical and Preraphaelite experiments, and a good deal of genuine and tender feeling. Our leaders have been noted for taste or thought or conviction—often for these traits combined. But we obtain our average impression of a literary era from the temper of its writers at large. Of late our clever artists in verse—for such they are—seem with a few exceptions indifferent to thought and feeling, and avoid taking their office seriously. A vogue of light and troubadour verse-making has come, and now is going as it came. Every possible mode of artmanship has been tried in turn. The like conditions prevail upon the Continent, at least as far as France is concerned; in fact, the caprices of our minor minstrelsy have been largely the outcome of a new literary Gallomania.

Now, I think you will feel that there is something unsatisfactory; something much less satisfactory than what we find in the little prose masterpieces of the new American school; that from the mass of all this rhythmical work the higher standard of poetry could scarcely be derived. To be sure, it is the providential wont of

youth to be impressed by the latest models, to catch the note of its own morntime. Many know the later favorites by heart, yet perhaps have never read an English classic. We hear them say, “Who reads Milton now, or Byron, or Coleridge?” It is just as well. Otherwise a new voice might not be welcomed—would have less chance to gain a hearing. Yet I think that even the younger generation will agree with me that there are lacking qualities to give distinction to poetry as the most impressive literature of our time; qualities for want of which it is not now the chief force, but is compelled to yield its eminence to other forms of composition, especially to prose fiction, realistic or romantic, and to the literature of scientific research.

If you compare our recent poetry, grade for grade, with the Elizabethan or the Georgian, I think you will quickly realize that the characteristics which alone can confer the distinction of which I speak are those which we call Imagination and Passion. Poetry does not seem to me very great, very forceful, unless it is either imaginative or impassioned, or both; and in sooth, if it is the one, it is very apt to be the other.

The younger lyrists and idyllists, when finding little to evoke these qualities, have done their best without them. Credit is due to our craftsmen for what has been called “a finer art in our day.” It is wiser, of course, to succeed within obvious limits than to flounder ambitiously outside them. But the note of spontaneity is lost. Moreover, extreme finish, adroitness, graces, do not inevitably betoken the glow of imaginative conception, the ecstasy of high resolve.

If anything great has been achieved without exercise of the imagination, I do not know of it. I am referring to striking productions and achievements, not to acts of virtue. Nevertheless, at the last analysis, it might be found that imagination has impelled even the saints and martyrs of humanity.

Imagination is the creative origin of what is fine, not in art and song alone, but also in all forms of action—in campaigns, civil triumphs, material conquest. I have mentioned its indispensability to the scientists. It takes, they surmise, four hundred and ninety years for the light of Rigel to visit us. Modern imagination goes in a second to the darkness beyond the utmost star, speculates whether the ether itself may not

<sup>1</sup> Copyright, 1892, by Edmund Clarence Stedman.

have a limiting surface, is prepared to see at any time a new universe come sailing from the outer void, or to discover a universe within our own under absolutely novel conditions. It posits molecules, atomic rings; it wrecks itself upon the ultimate secrets of existence. But in the practical world our men of action are equally, though often unwittingly, possessed by it. The imagination of inventors, organizers, merchant princes, railway kings, is conceptive and strenuous. It bridges rivers, tunnels mountains, makes an ocean-ferry, develops the forces of vapor and electricity, and carries each to swift utility; is already picturing an empery of the air, and doubtless sighs that its tangible franchise is restricted to one humble planet.

If the triumphs of the applied imagination have more and more engrossed public attention, it must be remembered that its exhibitors, accumulating wealth, promote the future structures of the artist and poet. In the Old World this has been accomplished through the instrumentality of central governments. In a democracy the individual imagination has the liberty, the duty, of free play and achievement. Therefore we say that in this matter our republicanism is on trial; that, with a forecast more exultant, as it is with respect to our own future, than that of any people on earth, our theory is wrong unless through private impulse American foundations in art, learning, humanity, are not even more continuous and munificent than those resulting in other countries from governmental promotion.

As for the poetic imagination, as distinguished from that of the man of affairs, if it cannot parcel out the earth, it can enable us to "get along just as well without it"—and this by furnishing a substitute at will. There is no statement of its magic so apt as that of our master magician. It "bodies forth the forms of things unknown," and through the poet's pen

Turns them to shapes, and gives to airy nothing  
A local habitation and a name.

I seldom refer to Shakspeare in these lectures, since we all instinctively resort to him as to nature itself; his text being not only the chief illustration of each phase that may arise, but also, like nature, presenting all phases in combination. It displays more of clear and various beauty, more insight, surer descriptive touches,—above all, more human life,—than that of any other poet; yes, and more art, in spite of a certain constructive disdain—the free and prodigal art that is like nature's own. Thus he seems to require our whole attention or none, and it is as well to illustrate a special quality by some poet more dependent upon it.

Yet if there is one gift which sets Shakspeare at a distance even from those who approach him on one or another side, it is that of his imagination. As he is the chief of poets, we infer that the faculty in which he is supereminent must be the greatest of poetic endowments. Yes; in his wonderland, as elsewhere, imagination is king.

There is little doubt concerning the hold of Shakspeare upon future ages. I have sometimes debated whether, in the change of dramatic ideals and of methods in life and thought, he may not become outworn and alien. But the purely creative quality of his imagination renders it likely that its structures will endure. Prehistoric Hellas is far removed from our experience; yet Homer, by force of a less affluent imagination, is a universal poet to-day—to-day, when there is scarcely a law of physics or of art familiar to us that was not unknown to Homer's world. Shakspeare's imagination is still more independent of discovery, place, or time. It is neither early nor late, antiquated nor modern; or, rather, it is always modern and abiding. The beings which he creates, if suddenly transferred to our conditions, would make themselves at home. His land is one wherein the types of all ages meet and are contemporary. He created beings, and took circumstances as he found them; that is, as his knowledge enabled him to conceive of them at the time. The garb and manners of his personages were also a secondary matter. Each successive generation makes the acquaintance of these creatures, and troubles itself little about their fashions and acquirements. Knowledge is progressive, communicable: the types of soul are constant, and are sufficient in themselves.

It does no harm, as I said at the outset of this course, for the most advanced audience to go back now and then to the primer of art—to think upon the meaning of an elementary term. Nor is it an easy thing to formulate clear statements of qualities which we instantly recognize or miss in any human production, and for which we have a ready, a traditional, nomenclature. So, then, what is the artistic imagination, that of one who expresses his conceptions in form or language? I should call it a faculty of conceiving things according to their actualities or possibilities—that is, as they are or may be; of conceiving them clearly; of seeing with the eyes closed, and hearing with the ears sealed, and vividly feeling, things which exist only through the will of the artist's genius. Not only of conceiving these, but of holding one's conceptions so well in mind as to express them—to copy them—in actual language or form.

The strength of the imagination is propor-

tioned, in fact, to its definiteness, and also to the stress of its continuance — of the memory which prolongs it for utilization. Every one has more or less of this ideal faculty. The naturalness of children enables us to judge of their respective allotments. A mother knows which of her brood is the imaginative one. She realizes that it has a rare endowment, yet one as perilous as "the fatal gift of beauty." Her pride, her solicitude, are equally centered in that child. Now the clearer and more self-retentive this faculty, the more decided the ability of one in whom it reaches the grade at which he may be a designer, an artist, or a poet.

Let us see. Most of us have a sense of music. Tunes of our own "beat time to nothing" in the head. We can retain the theme, or opening phrase, at least, of a new composition that pleases us. But the musician, the man of genius, is haunted with unbidden harmonies; besides, after hearing a difficult and prolonged piece he holds it in memory, perhaps can repeat it,—as when a Von Bülow repeats offhand an entire composition by Liszt. Moreover, his mind definitely hears its own imaginings; otherwise the sonata, the opera, will be confused and inferior. Again: most of us, especially when nervous or half asleep, find the "eyes make pictures when they are shut." Faces come and go, or change with startling vividness. The face that comes to a born painter does not instantly go; that of an angel is not capriciously transformed to something imp-like. He sees it in such wise that he retains it and can put it on his canvas. He has the clear-seeing, the sure-holding, gift which alone is creative. It is the same with the landscape-painter, the sculptor, the architect. Artistic ability is coordinate with the clearness and staying-power of the imagination.

More than one painter has declared that when a sitter was no longer before him, he could still lift his eyes, and see the sitter's image, and go on copying it as before. Often, too, the great painter copies better from some conception of his own brain than from actual nature. His mind's eye is surer than his body's. Blake wrote: "Men think they can copy Nature as correctly as I copy imagination. This they will find impossible." And again, "Why are copies of Nature incorrect, while copies of imagination are correct? This is manifest to all." Of course this statement is debatable; but for its philosophy, and for illustrations alike of the definite and the sublime, there is nothing later than Michelangelo to which one refers more profitably than to the life and letters, and to the titanic yet clear and beautiful designs, of the inspired draftsman William Blake. Did he see his visions? Undeniably. Did he call them into absolute existence? Sometimes I think he did; that all soul is endowed with the divine

power of creation in the concrete. If so, man will realize it in due time. The poetry of Blake, prophetic and otherwise, must be read with discrimination, for his linguistic execution was less assured than that of his brush and graver; his imagination as a painter, and his art-maxims, were of the high order, but his work as a poet was usually rhapsodical and ill-defined.

But, as I have said, the strength and beauty of any man's poetry depend chiefly upon the definiteness of his mental vision. I once knew a poet of genuine gifts who did not always "beat his music out." When I objected to a feeble, indistinct conception in one of his idyls, "Look you," said he, "I see that just as clearly as you do; it takes hold of me, but I have n't" (he chose to say) "your knack of definite expression." To which I rejoined: "Not so. If you saw it clearly you would express it, for you have a better vocabulary at your command than I possess. Look out of the window, at that building across the street. Now let us sit down, and see who can make the best picture of it in fifteen lines of blank verse — you or I." After a while our trial was completed. His verse, as I had expected, was more faithful and expressive than mine, was apter in word and outline. It reinforced my claim. "There," said I, "if you saw the conception of your other poem as plainly as you see that ordinary building, you would convey it definitely. You would not be confused and obscure, for you have the power to express what your mind really pictures."

The true poet, said Joubert, "has a mind full of very clear images, while ours is only filled with confused descriptions." Now, vagueness of impression engenders a kind of excitement in which a neophyte fancies that his gift is particularly active. He mistakes the wish to create for the creative power. Hence much spasmodic poetry, full of rhetoric and ejaculations, sound and empty fury; hence the gasps which indicate that vision and utterance are impeded, the contortions without the inspiration. Hence, also, the "fatal facility," the babble of those who write with ease and magnify their office. The impassioned artist also dashes off his work, but his need for absolute expression makes the final execution as difficult as it is noble. Another class, equipped with taste and judgment, but lacking imagination, proffer as a substitute beautiful and recondite materials gathered here and there. Southey's work is an example of this process, and that of the popular and scholarly author of "The Light of Asia" is not free from it; indeed, you see it everywhere in the verse of the minor art-school, and even in Tennyson's and Longfellow's early poems. But the chief vice of many writers is obscure expression. Their seeming depth is often mere turbidness, though it is true that thought may be

so analytic that its expression must be novel and difficult. Commonplace thought and verse, however clear, certainly are not greater than Browning's, but as a rule the better the poet the more intelligible. There are no stronger conceptions than those of the Book of Job, of Isaiah, Homer, Shakspeare, nor are there any more patent in their simplicity to the common understanding.

THE imagination in literature is not confined to that which deals with the weird or super-human. It is true that, for convenience' sake, the selections classed in the best of our anthologies as "Poems of the Imagination" consist wholly of verse relative to nymphs, fairies, sprites, apparitions, and the like. Although this justly includes "Comus" and "The Rime of the Ancient Mariner," there is more fantasy than imagination in other pieces,—in such a piece, for instance, as "The Culpit Fay." No one knows better than the critical editor of "The Household Book of Poetry" that there is more of the high imaginative element in brief touches, such as Wordsworth's

The light that never was on sea or land,  
The consecration and the poet's dream,—  
or Shakspeare's

Light thickens, and the crow  
Makes wing to the rooky wood,—  
or Bryant's path of the waterfowl, through

The desert and illimitable air,  
Lone wandering, but not lost,—  
or Stoddard's vanished city of the waste,

Gone like a wind that blew  
A thousand years ago,—

and countless other passages as effective, than in the whole of Drake's "Culpit Fay," that being eminently a poem of fancy from beginning to end.

But the imagination is manifold and various. Among its offices, though often not as the most poetic, may be counted invention and construction. These, with characterization, are indeed the chief functions of the novelist. But the epic narratives have been each a growth, not a sudden formation, and the effective plots of the grand dramas—of Shakspeare's, for example—have mostly been found and utilized, rather than newly invented. "The Princess," "Aurora Leigh," and "Lucile" are almost the only successful modern instances of metrical tale-invention, and the last two are really novels in verse. The epic and dramatic poets give imagination play in depicting the event; the former, as Goethe writes to Schiller, conceiving it "as belonging completely to the past," and the latter "as

belonging completely to the present." But neither has occasion to originate his story; his concern is with its ideal reconstruction.

The imagination, however, is purely creative in the work to which I have just said that it is not restricted, viz., the conception of beings not drawn from experience, to whom it alone can give an existence that is wondrous yet seemingly not out of nature. Such are the forms which Shakspeare called "from the vasty deep": the Weird Sisters, the greenwood sprites, the haunted-island progeny of earth and air. Such are those quite differing creations, Goethe's mocking fiend and the Mephistophilis of Marlowe's "Faustus." Milton's Satan, the grandest of imaginary personages, does not seem to belong to the supramortal class; he is the more sublime because, though scaling heaven and defying the Almighty, he is so unmistakably human. Shakspeare is not strong in the imaginative construction of many of his plays, at least not in the artistic sense,—with respect to that the "Œdipus at Colonos" is a masterpiece,—but he very safely left them to construct themselves. In the conception of human characters, and of their thoughts and feelings, he is still sovereign of imagination's world. In modern times the halls of Wonder have been trodden by Blake and Coleridge and Rossetti. The marvelous "Rime," with its ghostly crew, its spectral seas, its transformation of the elements, is pure and high-sustained imagination. In "Christabel" both the terror and the loveliness are haunting. That beauteous fragment was so potent with the romanticists that Scott formed his lyrical method, that of "The Lay of the Last Minstrel," upon it, and Byron quickly yielded to its spell. But Coleridge's creative mood was as brief as it was enrapturing. From his twenty-sixth to his twenty-eighth year he blazed out like Tycho Brahe's star, then sank his light in metaphysics, exhibiting little thenceforth of worth to literature except a criticism of poets and dramatists that in its way was luminous and constructive.

The poet often conveys a whole picture by a single imaginative touch. A desert scene by Gérôme would give us little more than we conceive from Landor's suggestive detail—

And hoofless camels in long single line  
Stalk slow, with foreheads level to the sky.

This force of suggestion is nevertheless highly effective in painting: as where the shadow of the cross implies the crucifixion, or where the cloud-phantoms seen by Doré's "Wandering Jew" exhibit it; and as when, in the same artist's designs for Don Quixote, we see visions with the mad knight's eyes. Of a kindred nature is the prevision, the event forestalled, of a single word

or phrase. Leigh Hunt cited the line from Keats's "Isabella," "So the two brothers and their murdered man,"—the victim, then journeying with his future slayers, being already dead in their intention. A striking instance of the swift-flashing imagination is in a stanza from Stoddard's Horatian ode upon the funeral of Lincoln :

The time, the place, the stealing shape,  
The coward shot, the swift escape,  
The wife, the widow's scream.

What I may call the constant, the *habitual*, imagination of a true poet is shown by his instinct for words—those keys which all may clatter, and which yield their music to so few. He finds the inevitable word or phrase, unfound before, and it becomes classical in a moment. The power of words and the gift of their selection are uncomprehended by writers who have all trite and hackneyed phrases at the pen's end. The imagination begets original diction, suggestive epithets, verbs implying extended scenes and events, phrases which are a delight and which, as we say, speak volumes, single notes which establish the dominant tone.

This kind of felicity makes an excerpt from Shakspeare unmistakable. Milton's diction rivals that of Æschylus, though nothing can outrank the Grecian's ἀνίρσιμον γέλασμα—the innumerable laughter of his ocean waves. But recall Milton's "wandering moon" (borrowed, haply, from the Latin), and his "wilderness of sweets"; and such phrases as "dim, religious light," "fatal and perfidious bark," "hide their diminished heads," "the least-erected spirit that fell," "barbaric pearl and gold," "imparadised in one another's arms," "rose like an exhalation," "such sweet compulsion doth in music lie"; and his fancies of the daisies' "quaint enameled eyes," and of "dancing in the chequered shade"; and numberless similar beauties that we term Miltonic. After Shakspeare and Milton, Keats stands first in respect of imaginative diction. His appellatives of the Grecian Urn, "Cold pastoral," and "Thou foster-child of silence and slow time," are in evidence. "The music yearning like a god in pain," and

Music's golden tongue  
Flattered to tears this aged man and poor,

excel even Milton's "forget thyself to marble." What a charm in his "darkling I listen," and his thought of Ruth "in tears amid the alien corn"! Shelley's diction is less sure and eclectic, yet sometimes his expression, like his own skylark, is "an embodied joy." Byron's imaginative language is more rhetorical, but none will forget his "haunted, holy ground,"

"Death's prophetic ear," "the quiet of a loving eye" (which is like Wordsworth, and again like Landor's phrase on Milton—"the Sabbath of his mind"). None would forego "the blue rushing of the arrowy Rhone," or "the dead but sceptred sovereigns, who still rule our spirits from their urns," or such a combination of imagination and feeling as this :

I turned from all she brought to those she could  
not bring.

Coleridge's "myriad-minded Shakspeare" is enough to show his mastery of words. A conjuring quality like that of the voices heard by Kubla Khan,

Ancestral voices prophesying war,

lurks in the imaginative lines of our Southern lyrist, Boner, upon the cottage at Fordham, which aver of Poe, that

Here in the sobbing showers  
Of dark autumnal hours  
He heard suspected powers  
Shriek through the stormy wood.

Tennyson's words often seem too laboriously and exquisitely chosen. But that was a good moment when, in his early poem of "Cenone," he pictured her as wandering

Forlorn of Paris, once her playmate on the hills.

Amongst Americans, Emerson has been the chief master of words and phrases. Who save he could enveil us in "the tumultuous privacy" of the snow-storm? Lowell has great verbal felicity. It was manifest even in the early period when he apostrophized the dandelion,— "Dear common flower," "Thou art my tropics and mine Italy,"—and told us of its "harmless gold." But I have cited a sufficient number of these well-wonted instances. Entering the amazing treasure-house of English song, one must remember the fate of the trespasser within the enchanted grotto of the "Gesta Romanorum," where rubies, sapphires, diamonds, lay in flashing heaps on every side. When he essayed to fill his wallet with them, the spell was broken, the arrow whizzed, and he met the doom allotted to pickers and stealers.

WITH respect to configuration, the antique genius, in literature as in art, was clear and assured. It imagined plainly, and drew firm outlines. But the Acts and Scenes of our English dramatists were often shapeless; their schemes were full of by-play and plot within plot; in fine, their constructive faculty showed the caprice of rich imaginations that disdained control. Shakspeare, alone of all, never fails to justify Leigh Hunt's maxim that, in treating

of the unusual, "one must be true to the supernatural itself." When the French and German romanticists broke loose from the classic unities, they, too, at first went wild. Again, the antique conceptions are as sensuous, beside the modern, as the Olympian hierarchy compared with the spiritual godhood to which Christendom has consecrated its ideals. But whether pagan or Christian, all the supernaturalism of the dark and mystic North has a more awe-inspiring quality than that of sunlit Italy and Greece. There are weird beings in the classic mythology, but its Fates and Furies are less spectral than the Valkyriës and the prophetic Sisters of the blasted heath. Even in the mediæval under-world of Dante, the damned and their tormentors are substantially and materially presented, with a few exceptions, like the lovers of Rimini—the

Unhappy pair  
That float in hell's murk air.

Having, then, laid stress upon the excellence of clear vision, let me add that imaginative genius can force us to recognize the wonder, terror, and sublimity of the Vague. Through its suggested power we are withdrawn from the firm-set world, and feel what it is

To be a mortal  
And seek the things beyond mortality.

What lies beyond, in the *terra incognita* from which we are barred as from the polar spaces guarded by arctic and antarctic barriers, can only be suggested by formlessness, extension, imposing shadow, and phantasmal light. The early Hebraic expression of its mysteries will never be surpassed. Nothing in even the culminating vision of the Apocalypse so takes hold of us as the ancient words of Eliphaz, in the Book of Job, describing the fear that came upon him in the night, when deep sleep falleth on man:

Then a spirit passed before my face; the hair of my flesh stood up. It stood still, but I could not discern the form thereof: an image was before mine eyes, there was silence, and I heard a voice, saying: "Shall mortal man be more just than God? Shall a man be more pure than his Maker?"

English poetry doubly inherits the sublimity of the vague, from its Oriental and its Gothic strains. Yet it has produced few images more striking than that one which lifts the "*Lusiad*," by Camoëns, above the level of a perfunctory epic. Vasco da Gama and his crew are struggling to pass the southern point of Africa into the Indian seas beyond. The Spirit of the Cape of Tempests, mantled in blackness of cloud, girt about with lightning and storm, towers skyward from the billows, portentous, awful, vague, and

with an unearthly voice of menace warns the voyagers back. I have said that the grandest of English supernatural creations is Milton's Satan. No other personage has at once such magnitude and definiteness of outline as that sublime, defiant archangel, whether in action or in repose. Milton, like Dante, has to do with the unknown world. The Florentine bard soars at last within the effulgence of "the eternal, coeternal beam." Milton's imagination broods "in the wide womb of uncreated night." We enter that "palpable obscure," where there is "no light, but rather darkness visible," and where lurk many a "grisly terror" and "execrable shape." But the genii of wonder and terror are the familiars of a long succession of our English poets. Coleridge, who so had them at his own call, knew well their signs and work; as when he pointed a sure finger to Drayton's etching of the trees which

As for revenge to heaven each held a withered  
hand.

Science drives specter after specter from its path, but the rule still holds — *omne ignotum pro magnifico*, and a vaster unknown, a more impressive vague, still deepens and looms before.

A peculiarly imaginative sense of the beautiful, also, is conveyed at times by an exquisite formlessness of outline. I asked the late Mr. Grant White what he thought of a certain picture by Inness, and he replied that it seemed to be "painted by a blind poet." But no Inness, Fuller, Corot, Rousseau, not even Turner, nor the broad, luminous spaces of Homer Martin, ever excelled the magic of the changeable blending conceptions of Shelley, so aptly termed the poet of Cloudland. The feeling of his lyrical passages is all his own. How does it justify itself and so hold us in thrall? Yield to it, and if there is anything sensitive in your mold you are hypnotized, as if in truth gazing heavenward and fixing your eyes upon a beautiful and protean cloud; fascinated by its silvery shapelessness, its depth, its vistas, its iridescence and gloom. Listen, and the cloud is vocal with a music not to be defined. There is no appeal to the intellect; the mind seeks not for a meaning; the cloud floats ever on; the music is changeful, ceaseless, and unclinging. Their plumed invoker has become our type of the pure spirit of song, almost sexless, quite removed at times from earth and the carnal passions. Such a poet could never be a sensualist. "Brave translunary things" are to him the true realities; he is, indeed, a creature of air and light. "The Witch of Atlas," an artistic caprice, is a work of imagination, though as transparent as the moonbeams and as unconscious of warmth and cold. Mary Shelley objected to it on the score that it had no human interest. It cer-

tainly is a kind of *aër potabilis*, a wine that lacks body; it violates Goethe's dictum, to wit: "Two things are required of the poet and the artist, that he should rise above reality and yet remain within the sphere of the sensuous." But there is always a law above law for genius, and all things are possible to it—even the entrance to a realm not ordered in life and emotion according to the conditions of this palpable warm planet to which our feet are bound.

As in nature, so in art, that which relatively to ourselves is large and imposing has a corresponding effect upon the mind. Magnitude is not to be disdained as an imaginative factor. An heroic masterpiece of Angelo's has this advantage at the start over some elaborate carving by Cellini. Landor says that "a throne is not built of birds'-nests, nor do a thousand reeds make a trumpet." Of course, if dimension is to be the essential test, we are lost. Every one feels himself to be greater than a mountain, than the ocean, even than Chaos; yet an imaginative observer views the measureless nebula with awe, conceiving a universe of systems, of worlds tenanted by conscious beings, which is to be evolved from that lambent, ambient star-dust.

Certain it is that when we seek the other extreme, the province of the microscopic, Fancy, the elf-child of Imagination, sports within her own minute and capricious realm. Her land is that of whims and conceits, of mock associations, of *Midsummer Nights' Dreams*. She has her own epithets for its denizens, for the "green little vaulter," the "yellow-breeched philosopher," the "animated torrid zone," of her dainty minstrelsy. Poets of imagination are poets of fancy when they choose. Hester Prynne was ever attended by her tricky Pearl. But many is the poet of fancy who never enters the courts of imagination—a joyous faun indeed, and wanting nothing but a soul.

A large utterance, such as that which Keats bestowed upon the early gods, is the instinctive voice of the imagination nobly roused and concerned with an heroic theme. There are few better illustrations of this than the cadences and diction of "Hyperion," a torso equal to the finished work of any other English poet after Shakspeare and Milton; perhaps even greater because a torso, for the construction of its fable is not significant, and when Keats produced his effect, he ended the poem as Coleridge ended "Christabel." All qualities which I have thus far termed imaginative contribute to the majesty of its overture:

Deep in the shady sadness of a vale  
Far sunken from the healthy breath of morn,  
Far from the fiery noon, and eve's one star,  
Sat grey-hair'd Saturn, quiet as a stone,  
Still as the silence round about his lair.

Forest on forest hung about his head  
Like cloud on cloud. No stir of air was there,—  
Not so much life as on a summer's day  
Robs not one light seed from the feather'd grass,  
But where the dead leaf fell, there did it rest.  
A stream went voiceless by, still deaden'd more  
By reason of his fallen divinity  
Spreading a shade: the Naiad 'mid her reeds  
Press'd her cold finger closer to her lips.

At the outset of English poetry, Chaucer's imagination is sane, clear-sighted, wholesome with open-air feeling and truth to life. Spenser is the poet's poet chiefly as an artist. The allegory of "The Faerie Queene" is not like that of Dante, forged at white heat, but the symbolism of a courtier and euphuist who felt its unreality. But all in all, the Elizabethan period displays the English imagination at full height. Marlowe and Webster, for example, give out fitful but imaginative light which at times is of kindred splendor with Shakspeare's steadfast beam. Webster's "Duchess of Malfi" teaches both the triumphs and the dangers of the dramatic fury. The construction runs riot; certain characters are powerfully conceived, others are wild figments of the brain. It is full of most fantastic speech and action; yet the tragedy, the passion, the felicitous language and imagery of various scenes, are nothing less than Shakspearean. To comprehend rightly the good and bad qualities of this play is to have gained a liberal education in poetic criticism.

Now take a collection of English verse—and there is no poetry more various and inclusive—take, let us say, Ward's "English Poets," and you will find that the generations after Shakspeare are not over-imaginative until you approach the nineteenth century. From Jonson to the Georgian School there is no general efflux of visionary power. The lofty Milton and a few minor lights—Dryden, Collins, Chatterton—shine at intervals between. Precisely the most unimaginative period is that covered by Volume III and entitled "From Addison to Blake." We have tender feeling and true in Goldsmith and Gray. There is no passion, no illumination, until you reach Burns and his immediate successors. Then imagination leaped again to life, springing chiefly from subjective emotion, as among the Elizabethans it sprang from young adventure, from discovery and renown of arms, above all from the objective study of the types and conduct of mankind. If another century shall add a third imaginative luster to the poetry of our tongue,—enkindled, perchance, by the flame of a more splendid order of discovery, even now so exalting,—it will have done its equal share.

THE Mercury and Iris of this heavenly power are comparison and association, whose light

wings flash unceasingly. Look at Wordsworth's similes. He took from nature her primitive symbolism. Consider his *elemental* quality: I use the word as did the ancients in their large, untutored view of things—as Prospero uses it, ere laying down his staff:

My Ariel,—chick,—

That is thy charge: then to the elements  
Be free, and fare thou well!

In Wordsworth's mind nature is so absolute that her skies and mountains are just as plainly imaged as in the sheen of Derwentwater; and thence they passed into his verse. He wanders,

Lonely as a cloud  
That floats on high o'er vales and hills.

He says of Milton,

Thy soul was like a star, and dwelt apart.

A primeval sorrow, a cosmic pain, is in the expression of his dead love's reunion with the elements:

No motion has she now, no force;  
She neither hears nor sees,  
Rolled round in earth's diurnal course,  
With rocks, and stones, and trees.

The souls of the Hebrew bards, inheritors of pastoral memories, ever consorted with the elements, invoking the "heavens of heavens," "the waters that be above the heavens," "fire and hail; snow, and vapor: stormy wind fulfilling His word." Of the Greeks, Æschylus is more elemental than Pindar, even than Homer. Among our moderns, a kindred quality strengthened the imaginations of Byron and Shelley; Swinburne too, whom at his best the Hebraic feeling and the Grecian sway by turns, is most self-forgetful and exalted when giving it full play.

I point you to the fact that some of our American poets, if not conspicuous thus far for dramatic power, have been gifted—as seems fitting in respect to their environment—with a distinct share of this elemental imagination. It is the strength of Bryant's genius: the one secret, if you reflect upon it, of the still abiding fame of that austere and revered minstrel. His soul, too, dwelt apart, but like the mountain-peak that looks over forest, plain, and ocean, and confabulates with winds and clouds. I am not sure but that his elemental feeling is more impressive than Wordsworth's, from its almost preadamite simplicity. It is often said that Bryant's loftiest mood came and went with "Thanatopsis." This was not so; though it was for long periods in abeyance. "The Flood of Years," written sixty-five years later than "Thanatopsis" and when the bard was eighty-two, has the characteristic and an even more sustained majesty of thought and diction.

It is easy to comprehend why the father of American song should be held in honor by poets as different as Richard Henry Stoddard and Walt Whitman. These men have possessed one quality in common. Stoddard's random and lighter lyrics are familiar to magazine readers, with whom the larger efforts of a poet are not greatly in demand. But I commend those who care for high and lasting qualities to an acquaintance with his blank verse, and with sustained lyrics like the odes on Shakspeare and Bryant and Washington, which resemble his blank verse both in artistic perfection and in imagination excelled by no contemporary poet. Whitman's genius is prodigal and often so elemental, whether dwelling upon his types of the American people, or upon nature animate and inanimate in his New World, or upon mysteries of science and the future, that it at times moves one to forego, as passing and inessential, any demur to his matter or manner. There is no gain-saying the power of his imagination—a faculty which he indulged, having certainly carried out that early determination to loaf, and invite his soul. His highest mood is even more than elemental; it is cosmic. In almost the latest poem of this old bard, addressed "To the Sunset Breeze" (one fancies him sitting, like Borrow's blind gipsy, where he can feel the wind from the heath), he thus expressed it:

I feel the sky, the prairies vast—I feel the mighty  
northern lakes;  
I feel the ocean and the forest—*somehow I feel  
the globe itself swift-swimming in space.*

Lanier is another of the American poets distinguished by imaginative genius. In his case this became more and more impressible by the sense of elemental nature, and perhaps more subtly alert to the infinite variety within the unities of her primary forms. Mrs. Stoddard's poetry, as yet uncollected, is imaginative and original, the utterance of moods that are only too infrequent. The same may be said of a few poems by Dr. Parsons, from whom we have that finest of American lyrics, the lines "On a Bust of Dante." There is a nobly elemental strain in Taylor's "Prince Deukalion" and "The Masque of the Gods." I could name several of our younger poets, men and women, and a number of their English compeers, whose work displays imaginative qualities, were it not beyond my province. But many of the newcomers—relatively more, perhaps, than in former divisions of this century—seem restricted to the neat-trimmed playgrounds of fancy and device; they deck themselves like pages, rarely venturing from the palace close into the stately Forest of Dreams. If one should stray down a gloaming vista, and be aided by the powers therein to chance for once upon some fine con-

ception, I fancy him recoiling from his own imagining as from the shadow of a lion.

HERE, then, after the merest glimpse of its aureole, we turn away from the creative imagination: a spirit that attends the poet unbidden, if at all, and compensates him for neglect and sorrow by giving him the freedom of a clime not recked of by the proud and mighty, and a spiritual wealth "beyond the dreams of avarice." Not all the armor and curios and drapery of a Sybaritic studio can make a painter; no esthetic mummery, no mastery of graceful rhyme and measure, can of themselves furnish forth a poet. Go rather to Barbizon, and see what pathetic truth and beauty dwell within the humble rooms of Millet's cottage; go to Ayr, and find the muse's darling beneath a straw-thatched roof; think what feudal glories came to Chatterton in his garret, what thoughts of fair marble shapes, of casements "innumerable of stains and splendid dyes," lighted up for Keats his borough lodgings. Doré was asked, at the flood-tide of his good fortune, why he did not buy or build a château. "Let my patrons do that," he said. "Why should I, who have no need of it? My château is here, behind my forehead." He who owns the wings of imagination shudders on no height; he is above fate and chance. Its power of vision makes him greater still, for he sees and illuminates everyday life and common things. Its creative gift is divine; and I can well believe the story told of the greatest and still living Victorian poet, that once, in his college days, he looked deep and earnestly into the subaqueous life of a stream near Cambridge, and was heard to say, "What an imagination God has!" Certainly without it was not anything made that was made, either by the Creator, or by those created in his likeness. I say "created," but there are times when we think upon the amazing beauty, the complexity, the power and endurance, of the works of human hands—such as, for example, some of the latest architectural decorations illuminated by the electric light with splendor never conceived of even by an ancestral rhapsodist in his dreams of the New Jerusalem—there are moments when results of this sort, suggesting the greater possible results of future artistic and scientific effort, give the theory of divinity as absolutely immanent in man a proud significance. We then comprehend the full purport of the Genesis record—"Ye shall be as gods." The words of the Psalmist have a startling verity—"I have said, Ye are gods; and all of you are children of the Most High." We remember that one who declared himself the direct offspring and very portion of

the Unknown Power, and in evidence stood upon his works alone, repeated these words—by inference recognizing a share of Deity within each child of earth. The share allotted to such a mold as Shakspeare's evoked Hartley Coleridge's declaration:

The soul of man is larger than the sky,  
Deeper than ocean—or the abysmal dark  
Of the unfathomed centre. . . .  
So in the compass of the single mind  
The seeds and pregnant forms in essence lie  
That make all worlds.

But what was the old notion of the act of divine creation? That which reduced divinity to the sprite of folk-lore, who by a word, a spell, or the wave of a wand, evoked a city, a person, an army, out of the void. The Deity whom we adore in our generation has taken us into his workshop. We see that he creates, as we construct, slowly and patiently, through ages and by evolution, one step leading to the next. I reassert, then, that "as far as the poet, the artist, is creative, he becomes a sharer of the divine imagination and power, and even of the divine responsibility." And I now find this assertion so well supported, that I cannot forbear quoting from a "Midsummer Meditation" in a recent volume of American poetry:

Brave conqueror of dull mortality!  
Look up and be a part of all thou see'st;—  
Ocean and earth and miracle of sky,  
All that thou see'st thou art, and without thee  
Were nothing. Thou, a god, dost recreate  
The whole; breathing thy soul on all, till all  
Is one wide world made perfect at thy touch.  
And know that thou, who darest a world create,  
Art one with the Almighty, son to sire—  
Of his eternity a quenchless spark.

WE have seen that with the poet imagination is the essential key to expression. The other thing of most worth is that which moves him to expression, the passion of his heart and soul. I close, therefore, by saying that without either of these elements we can have poetry which may seem to you tender, animating, enjoyable, and of value in its way, but without imagination there can be no poetry which is great. Possibly we can have great poetry which is devoid of passion, but great only through its tranquilizing power, through tones that calm and strengthen, yet do not exalt and thrill. Such is not the poetry which stirs one to make an avowal like Sir Philip Sidney's:

I never heard the old song of Percy and Douglas,  
that I found not my heart moved more than  
with a trumpet.

*Edmund Clarence Stedman.*

## OUT OF POMPEII.

The body of a young girl was found in Pompeii, lying face downward, with her head resting upon her arms, perhaps asleep; the scoria of the volcano had preserved a perfect mold of her form. She was clad in a single garment. No more beautiful form was ever imagined by a sculptor.

SHE lay, face downward, on her bended arm,  
In this her new, sweet dream of human bliss;  
Her heart within her, fearful, fluttering, warm,  
Her lips yet pained with love's first, timorous kiss.  
She did not note the darkening afternoon,  
She did not mark the lowering of the sky  
O'er that great city; earth had given its boon  
Unto her lips; Love touched her, and passed by.

In one dread moment all the sky grew dark —  
The hideous rain, the panic, the red rout,  
Where love lost love, and all the world might mark  
The city overwhelmed, blotted out,  
Without one cry, so quick oblivion came,  
And life passed to the black where all forget;  
But she — we know not of her house or name —  
In love's sweet musings doth lie dreaming yet.

The dread hell died, the ruined world grew still,  
And the great city passed to nothingness;  
The ages went, and mankind worked its will.  
Then men stood still amid the centuries' press,  
And in the ash-hid ruins opened bare,  
As she lay down in her shamed loveliness,  
Sculptured and frozen, late they found her there,  
Image of love, 'mid all that hideousness.

Her head, face downward, on her bended arm,  
Her single robe that showed her shapely form,  
Her wondrous fate love keeps divinely warm  
Over the centuries past the slaying storm.  
The heart can read in writings time hath left,  
That linger still through death's oblivion;  
And in this waste of life and light bereft,  
She brings again a beauty that had gone.

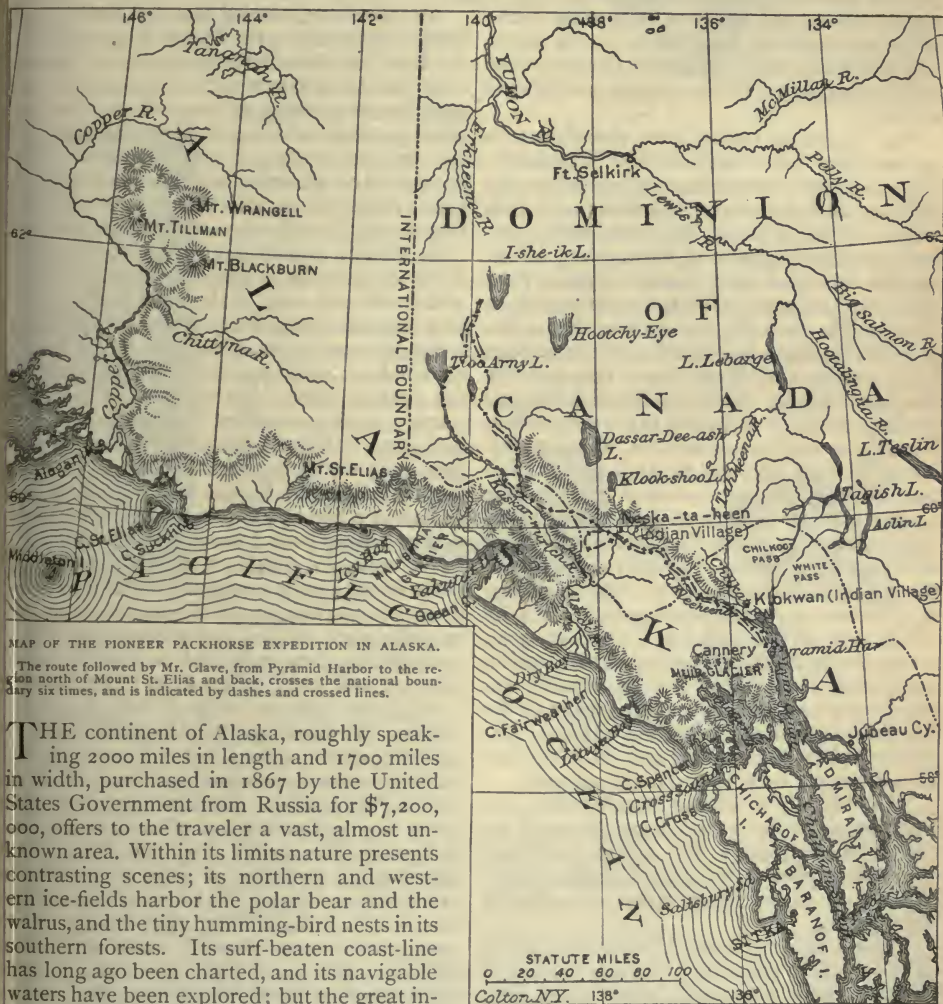

And if there be a day when all shall wake,  
As dreams the hoping, doubting human heart,  
The dim forgetfulness of death will break  
For her as one who sleeps with lips apart.  
And did God call her suddenly, I know  
She 'd wake as morning wakened by the thrush,  
Feel that red kiss, across the centuries, glow,  
And make all heaven rosier by her blush.

*William Wilfred Campbell.*

# PIONEER PACKHORSES IN ALASKA.

WITH PICTURES FROM SKETCHES AND PHOTOGRAPHS BY THE AUTHOR.

## I. THE ADVANCE.

THE continent of Alaska, roughly speaking 2000 miles in length and 1700 miles in width, purchased in 1867 by the United States Government from Russia for \$7,200,000, offers to the traveler a vast, almost unknown area. Within its limits nature presents contrasting scenes; its northern and western ice-fields harbor the polar bear and the walrus, and the tiny humming-bird nests in its southern forests. Its surf-beaten coast-line has long ago been charted, and its navigable waters have been explored; but the great interior, unapproached by waterways, is almost unknown.

A journey which I made in central Alaska in 1890, as a member of an exploring expedition, assured me beyond doubt that defective transport was the sole reason for the undeveloped and unexplored state of the land. The Indian carrier was the only means of transportation; he controlled the situation, and com-

manded most exorbitant pay. Moreover, his arrogance, inconsistency, cunning, and general unreliability are ever on the alert to thwart the white man. No matter how important your mission, your Indian carriers, though they have duly contracted to accompany you, will delay your departure till it suits their convenience, and any exhibition of impatience on your part

will only remind them of your utter dependence upon them; and then intrigue for increase of pay will at once begin. When *en route* they will prolong the journey by camping on the trail for two or three weeks, tempted by good hunting or fishing. In a land where the open season is so short, and the ways are so long, such delay is a tremendous drawback. Often the Indians will carry their loads some part of the way agreed upon, then demand an extravagant increase of pay or a goodly share of the white man's stores, and, failing to get either, will fling down their packs and return to their village, leaving their white employer helplessly stranded.

The expense of Indian labor, therefore, with its attendant inconvenience and uncertainty, renders a long overland journey impossible. An Indian cannot be hired at less than two dollars a day, which, however, is a mere trifle compared to the obligation of feeding him. Your carriers will start with loads weighing from 80 to 90 pounds, and will eat about three pounds dead-weight each day per man, so that at the end of the month a point will have been reached in the interior, and all your stores consumed by the men carrying them, and for this unusual privilege the traveler has still to pay sixty dollars a month for each man's services. When traveling on his own account, the Indian lives sparingly on dried salmon, but when employed by a white man his appetite at once assumes bo-constrictor proportions. Game is so scarce that it cannot be relied on to afford much relief to the constant drain on your provisions. Occasionally an opportunity will present itself by which you can bag a bear or a mountain-goat, a very pleasant addition to your larder, and an acceptable change from the monotonous bean-and-bacon fare; but you cannot depend on the rifle for food; without a plentiful supply of provisions, misery and hunger will drive you unceremoniously from your working-ground.

The only way to test the resources and possibilities of Alaska is by making thorough research through every part of the land, and conducting your investigations entirely independent of native report either favorable or discouraging.

I determined to revisit Alaska in the spring of 1891, and to endeavor to make a journey to the far interior with packhorses. From what he had already seen of the land, John Dalton, who accompanied me on the previous journey, was equally convinced with myself of the feasibility of such an undertaking. As I was about to make what I thought to be rather an important experiment, I ventured to ask some slight assistance from the geographical departments of the United States and Canadian governments, such as the loan of a few instruments,

which otherwise would lie idle in some Government office, in return for which privilege I promised a rough map of an enormous area of unknown land; but my suggestions failed to obtain a favorable hearing. Failing to awaken interest in my experiment through different channels, I decided to go at my own expense. Dalton had agreed to aid me; in fact, without the promise of his valuable services I should have hesitated to make the attempt.

An interesting part of this vast unexplored interior lies between the Yukon River and Mt. St. Elias on the southeast coast of Alaska. Gold has been discovered everywhere on the outskirts, warranting the supposition that the same precious metal exists in the interior. All the streams heading from this quarter show specimens of mineral along their shores, a fact which created in our minds the reasonable hope that we might strike the supply at its source.

In Alaskan expeditions it is essential that the party of whites be as small as possible. Each additional man adds to the need of transport, and besides, a large body of whites is liable to arouse the suspicions of the natives and to create trouble. So Dalton and I decided to make the venture alone. He was a most desirable partner, having excellent judgment, cool and deliberate in time of danger, and possessed of great tact in dealing with Indians. He thoroughly understood horses, was as good as any Indian in a cottonwood dugout or skin canoe, and as a camp cook I never met his equal.

We equipped ourselves at Seattle with four short, chunky horses weighing about nine hundred pounds each, supplied ourselves with the requisite pack-saddles and harness, stores and ammunition, then embarked on board a coast steamer, and sailed north from Puget Sound, through the thousand miles of inland seas, to Alaska. We disembarked at Pyramid Harbor, near the mouth of the Chilkat River, which is by far the most convenient point from which to start for the interior. No horses had ever been taken into the country, and old miners, traders, and prospectors openly pitied our ignorance in imagining the possibility of taking pack-animals over the coast-range. The Indians ridiculed the idea of such an experiment; they told us of the deep, swift streams flowing across our path, the rocky paths so steep that the Indian hunter could climb in safety only by creeping on his hands and knees. Finding that their discouraging reports failed to influence us, the Chilkat Indians, foreseeing that our venture, if successful, would greatly injure their interests by establishing a dangerous competition against their present monopoly, held meetings on the subject, and rumor reached us that our further advance would be resisted. However, when we were ready, we saddled up, buckled on

our pistol-belts, and proceeded on our journey without any attempt at hindrance save by verbal demonstration.

Upon our arrival at the coast-range we were compelled to suffer delay owing to the backwardness of the season. The mountains were still deeply buried in snow; on the higher slopes the topmost tufts on the tall spruce and hemlock just peered through their wintry mantling. During the daytime the thermometer rose to 54° above freezing-point, but each night the mercury dropped a few degrees below. The rapidly increasing heat of the sun, heralding the approach of summer, was ousting winter from its frigid sway, and furnishing the land with a gentler climate.

A short distance from the coast the snow lay deep, even in the valley lands. We found a fine patch of grass, however, around the village of Klokwan, twenty-five miles up the Chilkat River, which would maintain our horses in good condition till the season opened sufficiently to permit a further

CHILKAT PILLAR RECORDING LEGEND OF RAVEN FAMILY.

advance. At this Indian settlement there are about twenty houses constructed of heavy planking, roofed with rudely hewn boards, each having an immense aperture for the escape of smoke. On all sides these dwellings are loop-holed for muskets. Many a stubborn fight has been decided around this village, the planking being pitted with slugshot. Most of these huts are occupied by three or four families; some of greater dimensions, however, will shelter sixty Indians.

The Chilkat nation is divided into sections, each named after some living thing. There are the Ravens, Wolves, Eagles, Snails,

BANQUET DISH, 14 FEET LONG, 14 INCHES WIDE, AND 15 INCHES DEEP.

PLAITED FIBER DANCING-BONNETS.

Bears, etc., and the houses of the principal men are ornamented with large, grotesquely carved tablets, which signify by their particular design the legend or history of the respective family. These people have no written language. In former days every event of consequence was duly chronicled by some design, suggestive of the occurrence, chiseled upon a wooden pillar, such designs being placed in succession till an immense log was entirely

WOODEN DANCING-MASKS, CROW NATION.

taken up with a strange medley of exaggerated figures. Most of these carvings are very old, and their legends and historical references have been distorted by constant repetition. Only the oldest men attempt to interpret the puzzling designs produced by their ancestors. Formerly powerful chieftains held court here with barbaric pomp, and terrorized the neighboring peoples. They were bucaniers and pirates. The chief, Klenta Koosh, has a strange collection of old firearms, and outside his house two iron cannons defend the approach with threatening array—all stolen from a Russian ship which stranded on the Alaskan shore in former days. Slavery was then in general practice; prisoners became the serfs of

DRAWN BY W. TABER.

TOWING HORSES ACROSS THE CHILKAT RIVER.

their captors, and, as in central Africa to-day, constituted the principal source of wealth.

The old-time Chilkat, dressed in skins and furs obtained from the inland tribes, had his garments picturesquely fringed, and tasseled, and beaded, and woven in with stained swan-quills. He wore bracelets of copper, and carried copper spears, knives, and arrows. He was a warrior, and lived but to perish in battle. In those days no ceremony was complete unless attended by human sacrifice; execution of slaves was of frequent occurrence, for superstitious belief deemed disaster and illness the doing of angry spirits, only to be appeased by the shedding of human blood. Tribal wars and hand-to-hand fights followed from the slightest disagreement.

It was the custom then for all the young men in the village to plunge each morning, winter and summer, into the chilly stream, stay in the icy waters till benumbed with cold, and then to thrash one another with stout-thonged whips till circulation and animation were thoroughly restored. This novel apprenticeship is said to have had the effect of creating unusual stamina, producing the ability to withstand cold and hunger, and deadening feeling. The Indians say that a warrior thus trained, though mortally wounded, would face his foe and cut and stab while life remained. In such duels they

protected their heads with wooden helmets, shaped in design according to their nation; they also wore buckskin shirts, and bound their arms with strips of leather. Gormandizing competitions used to be a popular form of entertainment; an immense trough, called Klook-Ook-Tsik, 14 feet long, 14 inches in width, and 15 in depth, was filled with meats, bear and mountain-goat, fish, berries, and oil. Then families vied with one another as to who could eat the most, and many serious fights have resulted from the jealousy of the losers.

The present generation of Chilkat Indians is fast relinquishing tribal customs and ceremonies, and is taking but little interest in the history of its ancestors. Dances are no longer held in which family head-dresses and costumes are worn. The great wooden banqueting-trough is now embedded in moss and in grass that grows between the floor-boards in the house where once old "Kay Tsoo" assembled his followers by drum-beat, despatched them on the trail for war or trade, declared the guilty and the innocent, and condemned to death as he willed. At the present day there are a few men in the villages known as "ankow," or chief, but they have only feeble power.

In character these Indians are a strange composition—unemotional, morose, unsympathetic, superstitious, indifferent to death,

without the slightest idea of gratitude, and having an astonishing respect for the property of others. When on a trading-journey, or out hunting, they will leave their belongings hanging on bushes all along the trail; and snow-shoes, sometimes a musket, blankets, a leg of smoked bear, a dried salmon, are frequently noticed along an Indian path. No one thinks of touching any of these things, and they have not the power of the police to enforce honesty by intimidation.

An incident happened to us which demonstrates their utter want of feeling for the interests of others. While at one of our camps a party of Indians returned from a journey to the interior which they had made on snow-shoes. I noticed that their chief, Klenta Koosh, was not with them on their return, and I asked of one of the Indians, "Kusu Klenta Koosh" ("Where is Klenta Koosh?") "Klake sekoo, klake setteen" ("I don't know. I have not seen him"). Then he explained that he had not seen the chief for three days. While crossing the mountains they were caught in a dense fog; the party kept together for a time by calling constantly to one another, but finally the voice of the chief grew fainter and fainter, and then could no longer be heard. In the same breath with this explanation the Indian asked me, "Have the salmon started to run up our river?" I ignored his

DRAWN BY W. TABER.

"MARY" ON SNOWSHOES.

question, and asked again, "But where is Klenta Koosh?" As if disgusted at my interest in such a trivial matter, the man answered quite snappishly, "I don't know; either he has been killed by a bear or drowned crossing one of the swollen streams."

During our stay at the Indian village of Klokwan our horses remained in splendid condition. The natives themselves were too scared at the strange animals to annoy them. Their dogs at first made a noisy attack, but a few kicks from the horses warned them that it was more comfortable to howl at a distance.

Toward the end of May the summer warmth had rid the valleys of their winter snow; so we saddled up and moved on toward the interior. Our road from Klokwan lay along the course of the Kleeheenee, which heads away from a glacier, and, flowing from the westward, enters the Chilkat River just above the village. In crossing the parent river, now swollen by its

THE APPROACH TO A CAÑON.

tribute from melting snows into a deep, swift stream, we towed each of our horses across with a canoe, with which we also carried our supplies as far as navigation permitted. We then harnessed up again, and, riding on the pack-saddles, proceeded on our way along the stony valley of the Kleecheenee, which we had to swim several times on horseback, where the precipitous bluffs on one bank stopped our advance and compelled us to cross. At one place I had a bad fall. The horse I was riding sank into a small bed of quicksand, and, struggling to free himself, reared and fell backward. Fortunately I was thrown off a sufficient distance to be safe from his plunging and kicking, and finally Dalton and I helped him out. This stream, though at places not more than 100 yards in width, is a treacherous torrent. Only last year a man lost his life while attempting to descend it on a raft. After proceeding twenty miles from our last camp, another halt became necessary. The valleys were free from snow, but the mountain slopes seemed loath to discard their winter mantling.

We were compelled to pitch our tent again, and to wait till summer gained full power. At this camp both we and our horses were tormented most unmercifully by mosquitos and a hideous assortment of teasing insects. A liberal daubing of bacon fat and

pitch around the eyes and ears of our animals kept those sensitive parts free from the pests, and when my head grew so bumpy I could not get my hat on I applied the remedy to my own anatomy with a good deal of success. When not feeding, our horses would leave the sheltered places and seek the open stone flats to avail themselves of whatever breeze was blowing; they would then stand in couples so that each had the benefit of the other's tail as a swish. We had three horses, and one little mare, who was the pet of the band; she would often stand behind two horses, and thus enjoy a monopoly of the fly-brushes.

Our Indian guide was most anxious to ride on horseback, and an opportunity presented itself to indulge him while we were shifting camp a few miles. We had loaded our horses very lightly and were riding on the packs, and while thus occupied our Indian suffered a sudden change in his usually uninteresting and phlegmatic course of life. He was riding the little mare. Close to our camp

there was a broad, deep ditch, with steep banks on each side; we had always walked our horses down one side and up the other. The Indian had no reason to suppose that the mare would depart from that custom; but he had no time for any meditation on the subject, for upon arriving at the brink the little mare sprang over the ditch. The copper-colored rider was pitched into the air. He sat dazed until returning reason convinced him that it was too serious a mishap to be a dream.

Fearing that we might have a lot of soft snow to cross on the summit, we constructed sets of four snow-shoes for our horses. We trimmed

DRAWN BY DE COST SMITH.

A ROUGH BIT OF CLIMBING.

some stout young spruce saplings, then lashed these into hoops fourteen inches in diameter, and filled them in with plaited rope, each, when finished, resembling the exaggerated head of a lawn-tennis racket. The horse's hoof was placed in a pad in the center of the shoe, and a series of loops drawn up and laced round the fetlock kept it in place. When first experimenting with these, a horse would snort and tremble upon lifting his feet. Then he would make the most vigorous efforts to shake them off. Standing on his hind-legs, he would savagely paw the air, then quickly tumble on to his fore-legs and kick frantically. We gave them daily instruction in this novel accomplishment till each horse was an

we found covered with a dense growth of brittle shrub and coarse grass, and, on the extreme heights, snow-fields and moss-covered rock. We had made several reconnoitering trips to select the best ways, and we reached the summit, 4750 feet elevation, by slow and careful ascent, without any serious mishap. On the extreme heights of the divide a giant table-land extends for several miles in all directions. The air was cold, and the view cheerless, all lower lands were out of sight, and a distant circle of snowy peaks penciled out the horizon with glistening ruggedness. Everywhere on the high levels we crossed over immense patches of snow, in most places packed so hard that

expert; but our precaution proved unnecessary, for all the snow we crossed during the season was packed hard.

At last we set forth in earnest. Gradually we had been following the receding snow, and had now reached the foot of the Rocky Mountains, forming the divide or coast-range. The dreaded wall of towering heights, which had kept the land so long unknown, was ahead of us. Thus far our march had been over stony valleys along the Chilkat and the Klecheenee rivers. We now left the rivers and struck northward. On the lower slopes of the mountains we had to cut a trail through forests of spruce and hemlock. The steep hillsides of the higher levels

our horses' iron shoes made but little impression. Occasionally, however, the crisp surface would break through, and let us and our animals into deep, soft snow. While leading the little mare across one gulch, the hardened crust collapsed, and I and my horse tumbled out of sight into an icy stream coursing through its snowy tunnel beneath. By this time my mare had become quite philosophical in her acceptance of such incidents; she remained quiet, and looked at me as if inquiring what I meant to do under the circumstances. So I clambered out, and, giving her plenty of rope, urged and coaxed her to follow. The opposite bank of the gulch being only a few yards distant, by

energetic plunging she broke her way through and climbed out.

Everywhere the surface of the land had been deeply scarred by glacial violence into hollows and deep, dark cañons. It needed the greatest caution to descend and climb the treacherous cuttings, banked on each side by ragged, rocky walls, rising steep and threatening from the dank depths beneath, choked with boulders, and hemming in an angry torrent. Sometimes the approach was down a steep face of slippery granite, and the horses would slide several feet before getting foothold; in other places loosened rocks would give way. But our plucky little animals would struggle and spring into safety, and obtain respite from the threatened accident. Many of the cuttings grooved out are shallow, with low grass banks sloping gracefully to the beds of tiny streamlets beneath.

From the Kleeheenee River to the summit and over the divide our course had been almost due north. When once beyond the coast-range, which took up two days' hard traveling,

we gradually descended to a lower level, and struck away to the westward into a great valley, reaching as far as the eye could see, and walled on each side by a lofty line of mountains, thickly wooded to the snow-line. Avalanche and torrent had hewn the hillsides into deep ravines, and moving ice-fields had forced a way through the rocky wall. In the valleys beneath a rapid stream coursed along to the west, gaining volume on the way as tributaries from lakes and of melting snow flowed into it through the mountain gorges. As the lower levels were choked with timber-lands, we struck to the left, and found a better way along the crests of the foot-hills; we crossed immense areas of glacial deposit,—boulder, pebble, and sand,—floundered to the saddle-blankets in spongy quagmire, and tramped through pasture-

lands clothed in the richest grasses. Several times our horses sank deep into the treacherous bog, which threatened to engulf them, but by taking off their heavy packs, unsaddling them, and aiding their own efforts by lifting and hauling, we were always able to get them out into safety again. After encountering any such mishap, we made it a rule to prospect for another way, so as to avoid the bad places

on any future journey. Even on the heights we found lakes and marsh-lands, which owed their origin to waters from melting snow, imprisoned in hollows, without an outlet.

After two more days of hard traveling we reached a wooded bluff overlooking an Indian village. Descending to the banks of a river the course of which we had been following, we fired a couple of rifle-shots, which is the Indian signal of approach. Soon a crowd appeared on the opposite bank, and shoved their dugouts into the stream; we unsaddled our horses, and swam them across the river, and the Indians carried our belongings over in their canoes. We loaded up again, and a few minutes' walk took us to the Indian village of Neska-ta-heen. Dal-

guides, hired at two dollars a day and their board. This precaution is absolutely necessary in pioneer travel; those who follow in an explorer's footsteps can dispense with it. These men took us over the most difficult trails, endeavoring by all means in their power to make our experiment a failure. In fact, they had accompanied us in order to have the opportunity of disheartening us in their own interest. We carried their blankets, and everything they had, on our horses, so that they had to keep up with our pace. However, being paid by the day, they tried to delay us; but it was to our advantage to make long marches. On our arrival one of these men, Shauk, an Indian doctor of the Chilkat tribe, began at once to intrigue with the interior Indians, persuading them to arrest our passage through their country, as we had come to steal their land. We discharged this fellow at very short notice;

then the other two, who did not relish our hard traveling, decided to leave us and to return to the coast. Had we been dependent upon these creatures we should have been most seriously inconvenienced, but our horse-transport kept us safe against their unreliability. One of the guides, old Indiank, had a novel excuse for leaving us. He said his relatives on the coast did not wish him to travel into the interior any more; he was getting old, and they feared that some day

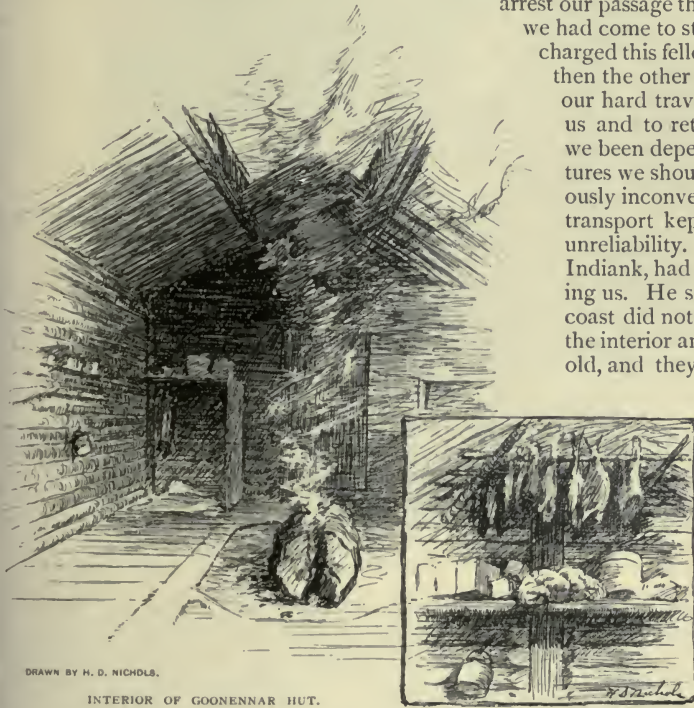

he would drop down dead on the trail. They promised him that, if he would remain with them, they would supply him with all the dried salmon he needed, and agreed, when he died, to put a little fence around his final resting-place. He gave us to understand that it would indeed

be sad should he die away from home and forfeit that little fence.

ton and I had met these people during the journey of the previous summer; we then approached this settlement from the north on our way down the Alseck River to the Pacific Ocean. The road over which we had now traveled was the direct way from the coast. No glaciers or insurmountable difficulties obstruct this route. Our arrival at this point with the pioneer band of horses is a most important event in Alaskan history, destined in the near future to receive due recognition.

We had been accompanied thus far by three coast Indians, one as interpreter, and two as

Our arrival at Neska-ta-heen created excitement among the natives; our horses, of course, were of far more interest than ourselves. They had never seen such animals before, and, for the want of a better name, called them "harklane ketl" (big dogs). This village looked as we had left it twelve months before; there was the same stifling atmosphere, and the natives themselves were wearing the same unwashed garments stiffened with fat and dirt. They received us good-naturedly, and the old

THE SONG OF THE CROW.

chief Warsaine portioned off a corner of his hut for us and our supplies, and the chief's wife consented to be photographed. One young fellow had learned from a Chilkat Indian a few English words. As we reached the place at mid-day, we were naturally astonished to be loudly hailed by "Good-night!" This youth used the expression "too late" with varied meaning; it described a tear in a shirt or a death. I was commenting on the pest of mosquitos, and he remarked, "E-koo-gwink kon sissa hit takar too late," meaning, "A little fire in the tent and the mosquitos will be 'too late.'"

Our poor horses suffered severely from the mosquitos; such crowds surrounded them that at times it was difficult at a little distance to make out the definite outline of the animals. Any future travelers should supply their horses with thick canvas cloaks, covering securely the

bodies and heads, and leaving only the eyes, nose, and mouth exposed. The continual pestering which the poor brutes suffer keeps them in poor condition; they cannot feed or lie down in comfort. We kept them hobbled all the season when not at work; a necessary precaution, for if seriously startled or frenzied by torment from insects, they might stampede a hundred miles before being overtaken.

The village of Neska-ta-heen is the principal settlement of the Goonennar Indians, the tribe inhabiting that part of Alaska bordered on the north and east by the Yukon, on the south by the coast-range, and on the west by the Copper River. They speak a language somewhat resembling the sing-song tongue of the Chinese, and entirely different from that of the coast natives, which is composed of harsh, raspy sounds, obtained by trying to cork up the throat

with the roots of the tongue. Throughout their conversation peculiar clicking sounds are heard, resembling the sudden rending of a new piece of calico. They are peaceably inclined, but are always weak-minded enough to be influenced and controlled by the Chilkat Indians, whom they instinctively acknowledge as their superiors. They are a strangely cold-natured people. They have no ways or words of greeting. A friend from a far-distant land arrives, and without any exchange of salutation with the villagers, whom he has not seen for many months, he divests himself of his pack and arms, draws his blanket round his shoulders, and squats before the fire till his host acknowledges his presence by offering him a pot of fish and game and a big horn spoon. When stimulated and refreshed by the appetizing dish, he will gradually and deliberately unburden himself of news, dilating fully upon hunting and trapping, but passing over deaths and accidents with but slight reference; for the price which an Indian obtains for his black-bear or fox-skin is of more concern than his mother's death.

The gastronomic taste of these people has an extended range. I have seen an Indian harpoon a salmon, bite a mouthful from just above the nose, then fling it back into the stream. Strange to say, the fish swims off as though the loss of that part of its anatomy were no inconvenience. I remember at one time visiting a little rocky island which had been taken possession of by a flock of gulls, and we gathered a lot of eggs. It was a little late in the season, however, and only a few were really fresh. An old Indian we had with us at the time watched us with disdainful gaze as we selected the good and discarded the bad. Then, as if to rebuke our fastidiousness and lack of economy, he broke half a dozen in his pan; good, bad, and indifferent were then all mixed up in an omelet to his liking. It is a crude palate that enjoys the delicious wild strawberry served in rancid fat, yet to the Indian this fruit is insipid unless thus dressed. Antiquated fish-heads are a favorite dish; they are kept in wooden troughs for several weeks before they are thought to be fit for eating. This dish is produced only upon some important occasion warranting a banquet. When eating meat they toast it in big long strips, then cut off each bite close to the lips with their knives. No people in the world are more addicted to the use of tobacco; they are incessantly indulging in the narcotic in some form or other. They smoke, chew, and plaster their teeth and gums with a paste made of dampened snuff and ashes; they even sleep with tobacco in their mouths. Men and women are equally devoted to the weed, and a child seven

or eight years old will never lose a chance of enjoying a few whiffs from its father's pipe.

In the disposal of their dead there is an element of precaution highly commendable. The departed one is laid on a pile of dried logs that have been smeared with grease; a fire is then started, and the few charred remains gathered up, tied in a small bundle, and stowed away in one of the neat, brightly painted little houses at the back of the village. On the coast each family has its own grave; in the interior they are not so particular. It is seldom that one finds people, even among the most savage, who do not have some respect for their dead, excepting, of course, the cannibal tribes of Africa. In making a short trip within a few miles of this settlement, we were attracted to a little clearing by a loud buzzing of flies, and found an Indian lying dead with only a few branches rudely thrown over him. The man was poor, and left behind no furs, or guns, or blankets to compensate any one for the trouble of disposing of the body according to tribal custom, so he was left where he died on the trail, although his own brother was in the party at the time of his death.

The dog plays a big part in Indian life. In summer he accompanies his master on the trail, and is harnessed with two little pack-bags in which is stored away about twenty-five pounds' weight, generally of shot, so that in crossing the stream no damage can be done. In the winter they draw the sleighs. These poor animals are very badly treated at all times. When an Indian child is out of temper he attacks a dog, pinches him, screws his ears round, or beats him with a stick. Only during a few months in the summer do the dogs get enough to eat. When the salmon are running they live on raw fish, but during the remainder of the year they have to be contented with scraps of skin and bone. When in good condition they are fine-looking animals, with a wolfish head and body, and a coat resembling that of a collie. As a rule want of food and hard treatment keep them very lean. They are equipped with strange digestive organs; at one time one of them ate at one meal three courses, which deprived us of our only piece of soap, the remains of a towel, and a goodly slice of Dalton's hat. On another occasion the leathers of our oars, thickly studded with copper tacks, were torn off and eaten by a dog.

While at Neska-ta-heen I witnessed the ceremony of the medicine-man expelling from a sick woman the evil spirit which was attacking her. He was dressed in beaded buckskins liberally fringed, and wore a blanket around his shoulders; a few little charms hung about his neck, and he held a wooden rattle. The patient was lying on a robe of sheepskins in the center of the hut, and a crowd of natives were sitting

at the sides. All were smoking, and a big fire was blazing, creating an atmosphere more to be dreaded than the evil spirit. The medicine-man approached the woman and uttered incantations, at first slowly and deliberately; but his speech and actions became more and more excited as he danced and hopped about, imitating birds and animals. He looked truly dramatic as he leaned over the woman, and, clutching fiercely with one hand at some unseen object, pointed tremblingly with the other to the aperture in the roof, as if grabbing the evil spirit and suggesting a means of exit. At intervals he would sing, accompanied by the beating of a drum and the voices of his audience. His first song referred to a raven, and while he sang he spread his blanket across his shoulders and hopped about and "cawed" in a way very suggestive of that bird. The chorus of this song ran thus:

Ann joo chay na tay na koo na hee;  
Ah ah ah, yeah; yeah, ah ah ah;

the meaning of which is that he has hunted throughout the village and has found no one practising witchcraft. His actions and incantations increased in violence till they became a veritable frenzy, and he fell groaning to the earth. This finale suggested that he had succeeded in ridding the sick woman's body of the evil one—and the audience went away. The medicine-man plays a big part in the life of the natives, and on account of his power he is the most dangerous influence with which a white traveler has to contend. The credulous natives have confidence in his power. They will give him skins and furs, which they have been gathering for months during the winter, in return for some paltry charm to protect them against the ills which beset mankind. A fever or a swelling will disappear if he only blows on the sufferer, and an ugly gash from a bear's claw will heal at once under the same treatment. It is a form of faith-cure. They believe their medicine-man obtains control over birds and animals, extracts their cunning, and allies this with his own ability, thus forming a powerful combination which they credit with supernatural power.

Neska-ta-heen is a most important rendezvous. During the winter the natives of the interior roam over all the land in small parties, hunting and trapping, but return here with their spoils of black and brown bear, black, cross, gray, white, and red fox, wolverine, land-otter, mink, lynx, beaver, etc., and exchange them for blankets, guns, powder, and tobacco, which the Chilkat Indians bring to them from the coast. The latter have always enjoyed a monopoly of this trade, and the natives of the

interior have been prevented by them from going to the coast.

From this point valleys of comparatively open country stretch away to the four quarters of the compass: to the east lies the way we had just traveled over; the valley of the Alseck River runs south to the Pacific Ocean; to the west there is a way to the back of Mt. St. Elias, and lakes Dassar-Dee-Ash and I-She-Ik lie to the north. Future research must tell what treasures lie concealed in these unknown regions.

From the coast to Neska-ta-heen we had taken the Indian trail as a basis, following it when good, and, as far as possible, avoiding its bad features. After that experience, we concluded that we could take a fully loaded pack-train from the sea to this village in seven days. Our successful experiment wrests from the Chilkat Indians the control of the road to the interior; the bolted gate hitherto guarded by them, to the exclusion of enterprise and progress, has swung back at the approach of the packhorse.

We tried our hardest to get guides at Neska-ta-heen to pilot us to the far interior, but they would not seriously entertain our proposal, though we offered most generous remuneration. They dared not go to the White River, which we wished to reach; the Indians of that region being always on the war-path. In former days the latter had made raids on this settlement and killed off the natives; in fact the present small population of about a hundred at Neska-ta-heen was attributed to fights with the Yookay Donner people dwelling on the banks of the White River. They pictured to us a frightful list of hideous obstacles to overcome—hostile natives, bottomless swamps, cañons, glaciers, and swollen torrents. Should we continue our course, we might possibly reach this far-away land and then be killed by the hostile Indians, and it was so far that we could not get back over the divide to the coast before winter set in, and we and our horses would perish. They begged us to change our plans and to make a journey through some safer part of the land, and to avail ourselves of their considerate guidance at two dollars a day and board.

I was able to extract a lot of crude topographical information from these natives; the novelty of pencil and paper and judicious little donations of tobacco threw them off their guard. By this means I gained a knowledge of their trails that proved of the utmost value to us in our advance. I cross-questioned them most fully, and learned of unmistakable landmarks and bearings; and when the natives refused to accompany us as guides, their scribblings of valleys, hills, and lakes availed to keep us on our course to the far interior of Alaska.

As regards the route taken by Columbus in his first voyage among the islands, these maps follow the lines laid down by the German traveler Rudolf Cronau, in his recent work, "America." His views are based on a thorough exploration of the Bahamas.

## CHRISTOPHER COLUMBUS.

BY EMILIO CASTELAR.

### V. THE NEW WORLD.

HERE are longings which can find expression only in music, and ideas which poetry alone may convey. As human speech, creation's divinest work though it be, is too weak to voice the infinite intensity of love,

so history, although showing forth the mind of man as the universe proclaims its Maker, can never in its cold analysis rise to the level of poetry, which after all is the sole human medium capable of fitly depicting the feelings of Columbus in presence of those islands—the ecstatic rapture of sight and sense, the mingling of all his being with the virgin life there revealed amid blue seas and skies, as though it were the work of his own soul and the crystallization of his great purpose.

Something akin to the feelings of Him who looked upon his work and saw that it was good must have been in the mind of Columbus when he gazed upon those islands, and in the ecstasy of his joy found them fair beyond the fondest imaginings of his fancy. Yet Columbus is silent

touching his emotions, as well at the sight of the dim taper that told of human life amid the wastes as when he beheld the first land that proved the truth of his predictions. A monkish chronicler, in the solitude of his cell, could scarce have set down more curtly the acts of other men than has Columbus his own deeds.

“At the second hour,” he says, “after midnight, the land appeared, two leagues distant. All sails were furled, leaving only the storm-sail, which is the squaresail without bonnets, and they lay hove-to awaiting the day, Friday, when they reached one of the Lucayos, which in the Indian tongue was called Guanahani. Soon naked men were seen, and the admiral went ashore in the long boat, with Martin Alonso Pinzon and Vicente Yañez, his brother, who was captain of the *Niña*. The admiral displayed the royal standard, and the captains the two flags of the green cross, which the admiral carried on all the ships as signals, bearing an F and a Y, and above each letter a crown, one on one side of the cross and the other on the other. On reaching shore they saw very green trees, and much water, and fruits of divers kinds. The admiral summoned the two captains with the others who went ashore, and

Rodrigo Descovedo the scrivener of all the fleet, and Rodrigo Sanchez of Segovia, and bade them bear faith and witness how he in presence of them all was taking and of right did take possession of said island for the king and for the queen, his lords, making all the requisite declarations as is more fully set forth in the minutes which were there drawn up."

Could the tale be more simply told? Does this recital, as bald as a bill of lading or a business letter, show any trace of the emotion which underlies other passages of the journal?

Halting only three days in the first-found island, Columbus passed on to others, giving them names typical of his thoughts and aims. The first he named San Salvador, in homage to our Lord, whose saving arm had upheld him in his sorest need; the second he called Santa María de la Concepcion, a name invoked by him throughout the voyage, and to the holy efficacy of which he attributed his good hap in escaping storm and sickness hitherto; the third he christened Fernandina, as a tribute to his king, a proof that the monarch had not been as hostile to Columbus as a certain historical school maliciously supposes, or that, if he had been, Columbus sought his future favor and consigned the past to oblivion; to the fourth he gave the name which he might well have used at first, or at least employed before the king's, the name of Isabella. Thus the discoverer went on, in the effusive joy of his first communings with this renewed Eden-world of nature, fulfilling by the giving of these names the debts of gratitude he owed.

Island after island rose before him, yet he came not to any continent, although in his ignorance of the true extent of the ocean he imagined himself at the threshold of Eastern Asia, and about to realize his lifelong dream of finding the Indian empire. Feverishly he sought the one factor that could lend value to his discovery, but gold was rare in those islands, which yielded but bloom and fruitage, heaped as by enchantment upon the billows of the Atlantic.

But let us follow the track of the discoverer. On October 12 Columbus sighted the island of San Salvador. On the 15th, he sailed toward the island he named Santa María, and thence toward Fernandina. October 19, he discovered Isabella. In the first two of these he was especially struck by the primitive and natural state of the islanders, naked yet not ashamed, who gazed upon the strange objects presented to their view with a childlike curiosity; in the second he remarked, as we have seen, an ascent in the scale of life denoted by the products of a rudimentary industry; in the third island a purity of atmosphere, a mysterious ethereal irradiation, a crystalline transparency

of the waters, a sweeter breath of bloom and savor of fruitage, and such rich dyes on the far horizon as enraptured him, and filled his body with a new life and his soul with poesy. Among its vegetable growths he particularly noted the lign-aloë, and among animals the iguana. As the tree comes from eastern Asia, Columbus gave close heed to it, and investigated its abundance in those fair new-found fields. With knotty trunk and fleshy leaves, its foliage dark-colored and its fruit resembling cherries, its sap bitter and the gum exuding from its fibers and the perfume shed by its wood very fragrant, it was medicinally known in those times, as Columbus notes in his diary—that record of whatever singular object met his keen scrutiny. No less worthy of note was the iguana, an exclusive amphibious product of those shores, and unknown in our own land, yielding a medicinal oil, and eaten by the natives and even by the discoverers themselves. Las Casas says they saw it eaten, but partook not of so repulsive a food; but Acosta, in his "History of the Indies," after mentioning several other articles of food, exclaims, "Much more toothsome is the iguana, although foul to look upon, for it is like the lizard of Spain." In traversing those seas, two contradictory impressions possessed the discoverer—his infinite delight with what he beheld and his bitter disappointment at finding nowhere the gold he coveted. He notes the products brought by the savages, and at each step very ingenuously and sincerely bewails the scarcity of the wished-for precious metal. The first tribe he met offered him balls of cotton yarn, gay parrots, arrows, "and other trifles which it were tedious to write down"; and although he inquired diligently if they had any gold, and noted how some of them wore a bit of it suspended from their pierced nostrils, he found nothing of value. He asked the bedizened natives whence they procured their gold, and from their responses, made in signs, not words, he inferred the existence of golden sands in the vicinity, and vases or jars of gold in neighboring lands that lay to the southward and were ruled by a powerful monarch. Columbus sought to induce his informants to guide him to this new El Dorado, but they soon convinced him that they knew nothing whatever about the journey. Still, all that he learned and saw strengthened his conviction that his true course lay toward the south, and he determined to steer thither, in the firm belief that he should speedily encounter the island of Cipango (Japan), so minutely described by Marco Polo as a rich mine of precious metals, situated some fifteen hundred miles from the mainland of India. These natives of San Salvador swam like tritons about his ships, offering limpid water and luscious

fruit, but not a grain of gold. Only Cipango could supply his need. But still he found not the Croesus of Cipango, nothing but more savages at Concepcion. Nevertheless, the garrulous Indians of San Salvador had told him how the people of this little isle wore many and heavy rings on their arms and ankles. The discoverer gloomily adds, "I firmly believe they said this as a trick to get rid of me." Indeed, having taken several Salvadoreans on board, and an Indian found in a canoe between San Salvador and Concepcion, the poor wretches sought flight by swimming, despite the vigilance of the officers and crew. For instance, one of the savages put out in his canoe in great haste for the ships, to sell his precious ball of cotton yarn. When the sailors kindly invited him on board the caravel, he obstinately refused, whereupon some of them sprang overboard and seized him. The admiral called the Indian to the quarter-deck, and, divining the necessity of exciting the curiosity of the natives, dressed him grotesquely like a Venetian harlequin, and sent him straightway ashore. They set a gaudy cap on his head, beads of green glass on his wrists, pendants of gilded and jingling hawk-bells in his ears, and so they sent him back, that the naked inhabitants might see what manner of men their visitors were, and what unknown marvels they brought.

As Columbus advanced he was gladdened by fertile islands, a limpid sea, brilliant cliffs, balmy air, and blue sky; but he halted not for these, pressing ever onward in search of virgin gold; for all his discoveries hitherto had yielded but a handful of bread, a gourd of water, and a bit of red earth rubbed to powder and smeared on a few dried leaves as an ornament in high estimation, offered by a poor savage, to whom the admiral gave honey and sweet cakes and sent him back to make good report of the newcomers among his own folk. In effect, the Indians of all those islets, divining the character of their guests by their gifts and their behavior, put out in their canoes, offering an abundance of fresh spring-water, which Columbus gladly accepted to replenish his casks, and were well repaid with gaudy tambourines worth perhaps a maravedí of Castile, and trinkets cheaper still, and candied sweets. Keeping clear of the reefs that abound in the Bahamas, and ever hurrying on in quest of gold, Columbus circumnavigated the islands and found some Indians disposed to barter, who offered him cotton cloths. Singular trees, wholly unlike those at home, thick-stemmed and bearing masses of pods on one side and reed-like leaves on the other; fishes of strangely variegated colors; and other natural objects, diverted their minds from the poignant regrets due to the scarcity of gold. At other places they saw dwellings like booths or the

tents of a European encampment, with tall and slender chimneys; but by far the most marvelous sight to them was a tiny bit of gold, worn as a nose-ring, bearing letters stamped upon it — a thing to be followed up, but which unfortunately could not be investigated through the failure of him who saw it, in the absence of Columbus, to beg or buy it.

At length, on October 18, he hoisted sail at daybreak and quitted Fernandina. He had found the island which the Indians declared to be full of gold, but their tales had proved untrue. Now and then a tiny fragment had been seen, but so small as to be of little worth. And yet, while the sad reality seemed most to mock their impatient desires, the Indians persevered in their reports of a realm ruled by a fabulously wealthy potentate, clad, they said, something after the Spanish fashion, with garments of enormous price. For two nights Columbus had awaited the apparition of this bejeweled monarch, to bring him gold in its native purity; but he saw naught but naked Indians of the same race as those already found, painted with white and scarlet in uniform designs, some few only of whom bore little bits of gold in their noses, "but so little," says Columbus, "that it is naught." The sense most gratified in this expedition to Isabella was that of smell. The whole island seemed to Columbus one vast fruit of intoxicating fragrance. A thousand spice-groves exhaled sweet savors, perfuming the breeze for many miles about. Strange vegetation, unknown odors, and fruits of luscious flavor abounded everywhere, enchanting sight and sense, without their discoverer being able in any wise to divine their qualities or give them a name, or even to classify or describe them with any exactness, for want of previous botanical training — a fact he bitterly and eloquently bewails in accents that even now move us to pity, heightened as they are by the long lapse of time and the magnitude of an achievement that greatens with each passing century. Neither Salvador, nor Concepcion, nor Fernandina, nor Isabella, nor any islet of those encountered in that tireless voyage and so attentively circumnavigated, answered to the phantasm of Cipango, pictured by the medieval chroniclers and seen in the fancy of Columbus as a fragrant paradise and rich storehouse where gold and gems were to be gathered in handfuls. So, having sailed through those regions without finding the gold he sought, it seemed to him that he should no longer tarry there in idle enjoyment, but press untringly onward until he should chance upon some land of greater wealth, such as the famed Cuba, whose name was borne on every breeze even as it hung on every lip.

One of the greatest difficulties in the discoverer's way was his ignorance of the several

tribal dialects. He himself says that he had to depend entirely on signs, it being utterly impossible to comprehend the spoken words. Thus he mistook the word *bohio* for a city, when it means any kind of shelter; he blundered in supposing *naca* to be the Great Khan whose fame ran in his mind, when it means "in the midst of," and he translated *habeque* as "empire" without thinking in his ignorance that it might mean anything else under heaven. But let us go on. At midnight of October 24 he weighed anchor, and set sail from Isabella toward the island called by the natives Cuba, but which he, misled by his fantastic charts, called Cipango. It rained and blew hard all that night. At dawn the storm lulled. A gentle breeze succeeded to the howling wind, and Columbus spread all the canvas of his caravel. Squaresail, studdingsails, foresail, spritsail, mizzen, topsail—every cloth was spread and the quarter-boat was at the davits. Thus he sailed until nightfall, when the wind freshened. Not knowing his bearings, and fearing to run for the island in the dark because of the abounding shoals and reefs on which he might be lost, he hove to and waited until dawn. That night he barely made two leagues. On the 25th, he sailed from sunrise until nine, running some five leagues, when he shifted his course to the westward, making eight knots an hour. At eleven, eight small islands were sighted, which he called Las Arenas, because of their sandy beaches and the shoalness of the water to the south. On the morning of October 27 he resolutely headed in quest of Cuba, but at nightfall a heavy rain forced him to lie to. On the 28th he entered a lovely estuary, free from dangerous rocks and shoals, all the shores he skirted being deep and the water of exceeding clearness. Thus he reached a river, at whose mouth he found twelve fathoms, and "never so fair a sight have I seen, the river being wholly bordered with trees, very beautiful and green, being unlike ours, with fruit and flowers, each after its kind."

Columbus was now in Cuba. The tropical horizon bathed in the intense ether; the Atlantic waters half azure and half opalescent, like a gigantic sheet of mother-of-pearl; the gilded reefs bright with nacreous shells; the keys covered with aquatic plants and swarming with infusorial life; the banks of the river fringed with mighty reeds like a floating garden; in the far reaches mountains tinged purple and lilac like crystalline masses of light; the tangled foliage forming an impassable rampart, rich with

rainbow colors; gorgeous insects like winged gems of every hue; the giddy fluttering of butterflies whose wings gleamed with gold, and crimson, and azure, and every prismatic tint till they seemed like airy garlands; plants of a thousand forms, heavy with bloom, bright to dazzle the eye and fragrant to entrance the senses; thick masses of lianas and trailers spread like Persian carpets under foot and drooping like Oriental tapestries from the branches overhead; the quick flight of humming-birds and parrakeets with plumage more bright than Cathayan silks; the choiring of nightingales and the chirping of crickets, unheard in our climes in the autumn and winter, but vocal yonder in October; the broad-leaved plantains, heavy and rich as velvet hangings and borne down with rosy and golden fruit; cocoa-palms towering skyward from the water's edge; tree-ferns guarding the portals of the trackless virgin forests that spread afar like a sea of verdure, in whose hollows hung gauzy vapors; fields of maize thick with tassels of waving gold and silken tresses; the massive logwood with its deep-red sap; date-palms and cherimoyers bearing exquisite fruit; cacti towering like cedars; mahogany and ebony trees of iron hardness; groves of orange and pomegranate; a flood of ever-varied foliage and an outpouring of animal life; heavy odors drifting afar over the seas; a tangle of indescribable vegetation; the blended murmur of the rippling streams and the trembling leafage—all this incredible exuberance must have moved the weary pilot of the worn-out world as painless Paradise moved the sinless Adam when he arose at the divine inbreathing to draw into his veins the mysterious effluvia of universal life.

Would you comprehend how this Cuba affected Columbus? Then heed not those writers who would bound his emotions by official phrases remote from the spot and the time, and ill reflecting the discoverer; go to the man himself as he appears in his private journal. This has been widely published and is familiar to many. Read it for a space, and, if possible, read it in the original Spanish; which, however marred by time and careless transcription, still breathes the first feelings of the discoverer.<sup>1</sup> We have heretofore complained of the bald narrative bequeathed to us of the landing on San Salvador. We said that we could glean nothing from that monkish scrivener's report to reproduce for us that most extraordinary and solemn moment in all history, which closed the older epoch and ushered in a new age for nature and

<sup>1</sup> The journal itself is lost. As late as 1554 it seems to have been in the possession of Luis Columbus. The text now extant is an abridgment by Padre Las Casas, and was first printed in Navarrete's "*Coleccion*" in 1825. The only version we have in English, somewhat retrenched and not always happy in rendering the

quaint conceits of the original, was made by Samuel Ketell, on the suggestion of George Ticknor, and was published in Boston in 1827, with the title, "*Personal Narrative of the First Voyage of Columbus to America.*" Copies are now scarce, even in the larger libraries. — TRANSLATOR.

for the spirit of man. But when Columbus comes to Cuba, he ceases to cramp his feelings, he represses not his style, he sets no bounds to his admiration, his thoughts break into lightning-flashes like those of some inspired poet when the frenzy of inspiration is on him. The Columbian account of Cuba may not be comparable in form with Milton's description of Paradise or Camoëns's portrayal of the ocean; but there is in it a simplicity that touches the sublime, in that it lacks effort and exaggeration, so that we feel and know that he who penned it was the discoverer himself, martyr to his own greatness, consumed by the creative fire that sheds its beams on all the world around, but destroys the unhappy possessor. Whenever Columbus praises the lands he found, he likens them to his cherished memories of gladsome Andalusia and sterner Castile. Not once does he recall his own Italy. Although born and nurtured on the fair Ligurian shores, not once is he reminded of their delectable valleys, their celestial peaks, their foam-capped seas, their marble cliffs, or their golden sands kissed by siren-haunted waves. But he compares Cuba with a very similar region, with that Sicily which was the theater of the divine deeds of Hellenic mythology. Its position between Italy and Greece, its pellucid waters, its azure skies, its shining shores, the deep clefts of its valleys where bloom the bay and myrtle beloved of the olden gods, its flaming Etna shooting a fiery glare through the far blue skies, and with its ashes making fruitful the stony fields—all these natural contrasts and outward manifestations of life lend it the rare attractiveness to which it owes the choice of its soil as a fit scene for the divine story of Olympus. Wherefore Sicily, at the portals of the Old World, typifies the past; whilst Cuba, at the gateway of the New World, is emblematic of the future.

Of all his discoveries, Cuba aroused in Columbus the deepest emotions. In the Lucayan Bahamas he was struck by the primitive innocence of their inhabitants—a rare and strange thing, in truth—more than by the aspects of nature, less gigantic and less beautiful than in Cuba. His pristine discoveries were mere islets, very unlike the two greater islands found at the close of this first voyage and hurriedly explored before his return to Spain. After leaving the Lucayos he came, as we have seen, to the uninteresting group of Las Arenas. Yet even here Columbus studied man in natural preference to all things else. These naked tribes, more amenable to the influences of kindness than to the sway of force; amazed at seeing a gaudy cap or hearing the tinkle of a hawk-bell or a tambourine; so kindly disposed that they swam out to the caravels, bearing cotton thread and parrakeets; so light-hearted

that they hung the gay ribbons and beads about their necks and danced to show their joy; poor in all things, for they went as their mothers bore them; their hair thick as a horse's mane and falling in long locks upon their shoulders; shapely of body and handsome of face; straight of limb and slender of waist; painted some with black, some with white, but more with red, their own complexion being that of the Canarians; so ignorant of arms that they grasped swords by the blade, and so unused to field labor that they knew not the mattock or the plow; some bearing scars as showing that man and warfare are born together, and that combat is more natural to him than toil; without other creed than a vague belief in the supremacy and grandeur of heaven—they absorbed the attention of Columbus, and plunged him into comparisons born of their contrast with the Spaniards, and of the lot which, in his innate prescience, he foresaw in store for them as a result of his miraculous advent. In his observations, hurriedly sketched and therefore the more interesting, such notes as the following occur in regard to his first visit to San Salvador: "Of women I saw but one, a mere girl; and all the men I saw were youthful, for none saw I of a greater age than thirty years." In another place he says: "All that they had they gave away for any trifle given to them," adding that they were "a gentle folk enough, desiring to have anything of ours, yet fearing that naught will be given to them unless they give something, and having nothing they take what they may and forthwith swim away." And further on he adds, speaking of their ignorance of trade: "Yet for potsherds and bits of broken glass cups were they content to sell; and even have I seen sixteen balls of cotton given for three *cootis* of Portugal, which is a *blanca* [half a *maravedi*] of Castile, and therein was more than an *arroba* [25 pounds] of spun cotton." Again he says: "In the eastern part of the island saw I many women, and old men and children which I saw not at my first landing"; and to give an idea of their simple nature he tells how "some brought us water, others things to eat; others, when they saw that I went not ashore, leaped into the sea, swimming, and came, and as we supposed asked us if we were come from heaven; and there came an old man into the boat, and all, men and women, in a loud voice cried—'Come and see the men who came from heaven; bring them food and drink.'" And elsewhere, speaking of the natives of Fernandina, he says: "These folk are like those of the other islands, and of the same speech and customs, save that these seem to me something more domesticated and better traders and keener, for I see that they have brought cotton and

other things, and that they better know how to chaffer for the price thereof."

These races, so foreign to the ideas and beliefs of the time, which admitted of no variation from the biblical account of the Adamic descent of man, would have still more astonished Columbus had he known in what part of the globe he was, and not supposed that all the scattered ocean-lands he met belonged to Asia. But in Cuba nature diverts his attention from man. The disemboguing of its rivers in the sea; the surface of its streams strewn with the showered petals of the myriad flowers that festoon their banks, and the trees whose interlocked branches gently shadow their current; the palm-trees, unlike those of Guinea or of Spain; the giant leaves thatching the tiny huts, the grass long and rank as in Andalusia's April- or May-time; the strange sorts of wild purslane and amaranth; the beautiful mountain-ranges, whereof none stretch far, but are very high; the swelling rivers to which he gave the names of the "Seas" and the "Moon"; the gay-plumaged birds; the chirp of the crickets as with us in summer; the precipices like the "Lovers' Cliff" in Andalusia, with yet other crags rising above them with such regularity as to appear from a distance like some great Moorish temple; the cool and fragrant groves; the spices and aromatic plants; the farinaceous tubers called *inãmes*,<sup>1</sup> that taste like sweet chestnuts; the bright-colored and delicious beans; the abundance of cotton growing wild on the hills, and bearing all the year round, for he saw both blossoms and opening bolls on the same bush; the mastic-gum, far better than that abounding in the Grecian archipelago; the inexhaustible aloes, the tufted grasses, and the tobacco; the trees wounded to extract their resins and gums; all these, appealing to his senses, excited him to an enthusiasm which would assuredly have been deeper could he have foreseen the innumerable benefits to flow to mankind from his discoveries, and the riches far beyond gold which they threw open to the world's trade.

His journal, during the fortnight in which he describes Cuba and its scenes, reads like a poem—and to be convinced of this you have only to set it by the side of similar descriptions found in the greatest of the world's epics. The oldest narrative of this sort is that told by *Ulysses* to *Aethæa* in her royal palace. Though heightened by the rhythmic flow of the Homeric verse, the "Odyssey" cannot even remotely compare in interest with the tale of Columbus. The magical dwelling of the enchantress *Calyпсо* finds no parallel in these Antillean seas,

<sup>1</sup> Yams, not sweet potatoes as most writers explain.

nor can the Ogygian growths compare with this harvest of strange products to nourish the human race and increase its powers an hundredfold. Another epic, the immortal story of *Æneas*, may excel our discoverer's narration in literary merit, but it sinks beneath it in historical and social interest. Although Virgil has therein aimed to mingle the combats of the "Iliad" and the voyage of the "Odyssey," its epic subjects cannot compare with that presented by the coral reefs which at the mighty spell of Columbus arise under the beams of a new sun from the Shadowy Sea, filled with unknown races, and destined not only to enlarge the bounds of earth, but the mind of man as well. The waters plowed by *Æneas* in that far-off age had already been cloven by many prows, whilst the virgin waters which Columbus sailed, save for a few frail canoes that ventured not out of sight of land, had never felt keel upon their vast and wayless surface, nor borne the navies and the arms of a great and advanced navigation.

No poet of the Old World or the New so gifted as *Camoëns* to sing the epic of sea discoveries. The motive of his "Lusiad" has much in common with our discoverer's journal. Portugal anticipated and kept pace with us in expanding ocean's bounds and finding vast continents. Whilst Spain was exploring the unknown seas whence the new world of America arose, the explorations of Portugal found their reward in the olden lands of Asia. That teeming era of Lusitania brought forth alike the pilot-discoverers and the poet to sing their deeds. A living poem in sooth was that apparition of the Indies regained for Europe by the sea-Alexanders of the West. *Camoëns* begins his poem by declaring that the fame of his *Vasco* shall forever dim *Æneas*'s glory. How marvelous to behold, in the Rome of Leo X., bound in the golden chains of Portugal, the elephants and leopards that in bygone days had filled the arenas of the Cæsars in token of the subjection of all earth to the Eternal City. Oriental pearls and rubies, Moluccan cloves, Sumatran gold, the cinnamon of Simahala, the camphor of Ormuz, the indigo of Bombay, amazed all Christendom at the same time that the poesy of Portugal grew strangely exalted and exuberant. *Camoëns* possessed the stature to produce, like a fabled Titan, the cyclopean epic that sang the new birth of the globe, and to be fit compeer of the colossal *Vasco da Gama*, who, modern though he be, seems like some mythical deity by his marvelous discovery of the East Indies. But the traits of the Renaissance enfeebled *Camoëns*. A true son of his age, he saw all things through the enduring traditions of the classic Muse. Therefore, Olympus is the supernatural mainspring

of his poem, and ancient art gives it form. But the spirit of ancient art was dead, and in its stead the Church ruled the human soul, so that a poem in which the Greek gods moved and acted could at best be only archæological and erudite, although it becomes popular and epic when it sings the story of Lusitania in bygone days and in that Renaissance time. More genuinely poetical appear to me the mass celebrated in that Franciscan convent on the high headland of La Rábida; the "Ave Maria" heard along the shores of Guadalquivir and Cadiz on the evening of the day the discoverer sailed from the mouth of the Odiel toward the Shadowy Sea; the hymns to the Virgin on the caravel's deck as the first stars twinkled in the west or the full moon flooded the rippled sea; the echoes of the "Ave maris Stella" blending with the voices of ocean; the "Te Deums" sung on sighting land and on disembarking, and the sublime thanksgiving of Columbus for the happy end of his voyage, than the apparition of *Mercury* to *Vasco* to warn him against the perils awaiting him at Mombaza, the fabulous rising of *Venus* among the isles of India, or the presence of any gods dead for a thousand years to human conscience and powerless to rekindle with poetic fire the cold ashes of worn-out beliefs. On the other hand, Camoëns is epic in the highest degree, worthy of a place beside Homer, often superior to Virgil, more natural than Tasso and Milton, when, as his forerunner Dante had evoked the supernatural world of the middle ages, he evokes the world of nature, new-born in that paschal time of the Renaissance, and offers in lofty strains the story of Lusitania, the description of the races discovered by his fellow-countryman, and, therewithal, the poesy of the sea; now picturing the making ready and the launching forth to face peril and trial, amid the tears of those on shore; now the cleansing of the hulls from weeds and barnacles in the ports; now the waves pallid beneath the lightning glare; now the waterspout whirling madly aloft, and bearing thick floods in its vast bosom. If Camoëns prevails and endures among the epic poets of the Renaissance above the delirious Ariosto, the artificial Tasso, and the satirical Pulci, it is because he sings nature, rejuvenated by the discoveries of Portugal. To what heights might he not have risen, had he not been circumscribed by the narrow patriotism of his Portuguese nature, and had he, inspired aright by the glory of the whole peninsula, given us the incredible discovery of America by the mighty genius of Columbus! Recognizing his merits as I do, I aver that there is not in all his verse, polished and inspired though it be, any utterance of *Vasco's* so deeply human as the unstudied record

of the emotions of Columbus on beholding Cuba.

The only place where I find aught approaching the description of Cuba by Columbus is in the English Roundhead poem of "Paradise Lost." *Adam's* self-communings in Eden have in them somewhat of our pilot's artless tale of the splendid tropical life of Cuba; but I discern therein a defect which also mars the "Lusiad." As the garden to which *Vasco* leads *Venus* is cut and trimmed in the style of Virgil or Theocritus, so the Eden of Milton is like a smug English park of the seventeenth century.

HAVING thus contemplated the feelings begotten in Columbus by the wondrous sum of Cuba's aspects, let us follow him step by step in his explorations. Let us not lose sight of the fact that the discoverer at one and the same time tells of his impressions of the natives, and of the impressions formed by them of their visitors— heaven-sent, as they imagined in their innocence. In this regard the Spaniards did not inspire the native Cubans with such a blind trustfulness as the other islanders had shown. Far from thronging to them in adoration, they fled and hid away, as from evil spirits. Although they possessed canoes of considerable capacity, they concealed them in the cane-brakes. But Columbus, being a born explorer, did not yield to such tokens of fear; rather was he stimulated to seek the cause of this troubled apprehension. He landed on the shores of the bay where his ships lay anchored, and made careful search in every quarter. The first two dwellings he found were deserted by their timid inhabitants, but filled with household articles showing their recent occupancy. Like the huts of the islands previously visited, they were built of plaited palm-fronds in the shape of tents. Fishing-nets, barbed harpoons, worn hooks of bone, all the implements of fishery he saw, led him to suppose himself in a cleanly and tidy fishing settlement, like those of some European shore. Their large size and ample hearths, indicating rudimentary culture, caused him to form optimistic anticipations touching the region where he had landed. Some kind of mystical notation seemed to exist, since to the repeated inquiries of Columbus about the empire of Cathay and the Great Khan, the Indians answered that the land was watered by ten great rivers, and that ten days' sail separated them from the mainland. But, as Padre Las Casas acutely remarks, either Columbus misunderstood these Indians, or they lied to him, for the mainland now called Florida lay less than five days distant. It was, however, impossible to cruise in search of other lands without ascertaining somewhat of their position and

character. Habituated to see human society organized on a monarchical basis, he inquired persistently for the king of that great realm, whom he conjectured to be in constant intercourse with the Khan, himself the ruler of a mercantile empire. He wandered thus until vesper-time, finding several well-built villages, all utterly abandoned, for their inhabitants had fled in terror to the uplands at the sight of the caravels. In these houses the explorers found, besides the customary utensils, long, neatly made settles, fashioned like beds, with somewhat skilfully carved head-pieces. They also found images rudely representing the female form, and some domesticated wild-fowl. Columbus permitted nothing to be disturbed, in order not to arouse resentment or distrust in the minds of the natives. In his habit of comparing all that he beheld in this new world with the things of the old, he supposed he saw the dried heads of cows, but was mistaken, inasmuch as these animals were there unknown; in reality the skulls were those of the manatee, an aquatic mammal, and resembled heifers' heads in size and shape. Their flesh was found to be palatable, in firmness and flavor something like beef. In these excursions Pinzon attempted to glean information from the natives, but so confusedly that he supposed Cuba to be a city when it was the name of the whole island, and to be joined to the mainland instead of being sea-girt; and the word *Guanacán* to mean the imperial Khan of India, when it merely denoted a neighboring district. The flight of the natives hindered them from obtaining even such slight details as these, and they sent out an Indian whom they had brought with them from the first-found island, charging him to quiet the distrust of the natives and to induce them to trade with the newcomers, who, far from seeking to despoil them of their belongings, offered them marvels from distant celestial regions. The Indian swam ashore, and in a loud voice proclaimed his novel mission, whereupon two natives appeared, embracing him and carrying him to the nearest hut, where his reassuring words, backed by the proofs of good will he brought with him, persuaded many of the islanders to accompany him to the dreaded ships, in great canoes, carrying balls of cotton thread and other articles of barter. Columbus ordered his crew to touch nothing, and confined himself to inquiring for gold. But even in this simple matter a misunderstanding arose, for he supposed the word *nuca* to mean gold, when the Indians really called it *caona*. But, call it by what name they would, it was nowhere to be found, being as rare as on the other islands. Gold being the only proof they could give in Castile of the treasures they had found, it was humanly impossible to abandon the search for

the metal; and so they sent fresh envoys inland, to wit: Rodrigo of Jerez, a townsman of Ayamonte, and Luis de Torres, a converted Jew, who had served the Adelantado of Murcia, and who knew many Semitic tongues. By means of these, with two natives who went with them, the explorers felt sure of finding, first the king of the island, and then its gold. These envoys journeyed twelve leagues, and came to a sort of city of about a thousand souls. Greater courtesy than that natural to these people it would be hard to imagine. They lodged their visitors hospitably, and strove to show them attention. Reverently they touched their hands and kissed their feet, believing them heaven-sent. With unstinted liberality, they offered them such food as they had. They seated them in the places of honor, while they squatted on the ground about them. The women gathered in an outer circle. When they had heard the report of the two Guanahaní Indians touching the Christians, they implored them to dwell among them. They could not make out a word of the languages spoken by Torres; neither could he, however versed in the Oriental tongues, understand anything of their speech. Nothing was wanting save for the Indians to worship the Spaniards. Although the admiral had supplied the envoys with charts and specimens of European minerals and spices to offer to the chief as to a monarch in covenant of friendship and commerce, they accomplished nothing, being at length convinced that they had only an agglomeration of men to deal with, destitute of the elements of social organization that make up true civic societies. So emotional were the natives, prone to admiration bordering on idolatry and ready to yield the strangers a service akin to slavery, that they followed these envoys, whose speech was sealed to them, in the assurance that they would lead them to the heaven whence they had come. They might have taken five hundred of them had they wished, but they contented themselves with covenanting for the company of the chief villager, his son, and one other native. The young chief visited Columbus with great courtesy, looked with indifference upon the gifts they offered him, so unlike anything he had ever known, and quitted him, saying he would return the following morning—but he never came back. Columbus doubtless regretted having allowed him to depart, since he took five Indians of both sexes on board his ship, and even the husband of a captured Indian woman, who came to the caravel and begged to be taken aboard. Here Padre Las Casas, the historian of the expedition, who is universally consulted as an authority, waxes oracular, and, somewhat like the German professors of our day, appeals to international and natural law against

this proceeding, which he harshly censures as an act of conquest; while Columbus, the peaceful conqueror of these tribes, mentions the incident as if it were the most natural thing in the world, and his simple narrative exhibits not the slightest trace of remorse. Among all the historians who wrote soon after the discovery, none so passionately and enthusiastically defends Columbus as Las Casas; but in presence of a fact to him so incredible as the criminal kidnapping of unoffending families, the chronicler indignantly rebels. He admits the good intention of the sublime pilot; but to this violation of natural rights and eternal justice he charges all the afflictions that later overwhelmed Columbus, holding them to have been a terrible and deserved punishment. In his stoical philosophy, heightened by his monastic temperament, he declares that good is only to be wrought through good, and that the desired end, however pure, is never to be attained by wrongful acts; so that to the padre the discovery seems good and the conquest evil, as though the two were not correlative, and as though, in the ill-starred inheritance of our race and through all the sad pages of our history, stained by dark and baleful deeds to which even slavery itself seems merciful, man had not ever ruthlessly exterminated man in the implacable fury of hatred and the horrors of perpetual combat.

Columbus, who had come to Cuba filled with the dreams of hope, found not in Cuba the gold he so ardently sought as a tangible evidence of his marvelous achievement. On the alert for any hint given by the natives, he blunderingly believed every conjecture gleaned from their uncomprehended speech, when it seemed to confirm his own imaginings. The Indians said "*Babeque*," and he fancied he recognized the title they gave to the golden empires figured on the maps of that fantastic age and limned in his own confused cosmology. Passing from one false interpretation to another, at length he came to believe that another shore was near, whose inhabitants were covered with ornaments of massy gold, and yet other lands peopled by a race resembling the Cyclops fabled of old, having but one eye set above a dog's muzzle. He went on, ever in quest of these treasures and marvels. Having met with chilly weather, as might be expected in November and December, he bore eastward and southward. In this voyage everything allured and enchanted him: the serene skies, the celestial water, the graceful headlands, the deep and calm bays, so pellucid and tranquil as to elicit his lively admiration; the island groups, like heavenly constellations—all these our new pilgrim of nature beheld, absorbing their vitality as a sponge absorbs water. Yet the manifold beauties and lovely changeful aspects of the

Cuban landscape only intensified his keen disappointment at finding no gold.

November 19, he sailed in search of the new region toward Puerto Principe, where he erected a cross. He intended to sail along the coast, to gain a better knowledge of the land that lay in sight, while seeking that other realm pictured in fancy; but strong head-winds that baffled and drove him upon dangerous shoals constrained him to stand out to sea. And now befell the greatest misfortune of his voyage—the parting company with his lieutenant, that matchless pilot and unequaled organizer, to whose efforts the successful outfitting of the expedition was mainly due, and whose firmness had overcome all obstacles in its path. The thirst for glory and gain which our race inherits; the inevitable insubordination of those natures who fancy themselves born to command, not to obey; the temptation to forestall Columbus in the quest for the golden shores, and elevate himself by reaping the harvest now that his captain had won the fame of the discovery, led Pinzon to an act whence sprang all his subsequent disasters. The admiral, however, was not disconcerted by this. As often as the wind allowed he stood toward the land, and again made the offing, entranced alike by the magic vistas of shore and sea. Poetical and sensitive by nature, he never tired of gazing upon the waters, to which he gave the name of "Our Lady's Sea," or upon the calm bosom of the limpid rivers, the blossom-laden banks, the rocky cliffs gilded and glittering like illusive hopes, the pine-woods exhaling balm, the amber-like gums, the delectable brooks below contrasting with the peaks far above and bright with evanescent hues, the intermingling of palms and cedars, the countless quiet bays lake-like in beauty and like havens in their repose, the canoes floating by the shores or drawn up on land and concealed by leafage, the unclad Indians indistinguishable save by their varied painting and fanciful head-gear of feathers, the emotions awakened in those savages at the sight of the Spaniards, white and thick-bearded, cased in armor which they imagined to be the natural covering of their bodies, and apparently descended from some higher celestial sphere to mingle with puny mortals on the lowly earth.

At length Columbus reached the most easterly point of Cuba, and there he learned that before him lay another island, called by the natives Haïti—the lofty land. Columbus, who kept on giving new names at will to the islands he found, called Cuba *Isla Juana*, in memory of the ill-fated prince Don John, later to be cut down in the flower of young manhood when about to unite Spain and Portugal as his parents had united Castile and Aragon. Before

he sighted Haïti he cast about for a name to bestow upon it, not rightly apprehending the import of the Indian word. He discovered it December 5, 1492, after sailing eastward sixteen leagues from the extremity of Cuba. He was much struck by its resemblance to Spain. Soles and red mullet were caught in its waters; asphodel and arbutus blossomed on the uplands; on the hillsides stretched dense oak-forests, and in their deep intervalles lay neat, well-tended gardens, familiar plants of dark-green foliage festooned the streams; and the cone-filled pine crested the heights, while huts much like our own were seen. These resemblances led Columbus to give it the name of Española (Hispaniola), in harmony with his reawakened memories of the mother-country. The natives appeared to be fairer of skin than those seen before, and higher in culture. They fled, like the rest, but came back at the call of the Spaniards. Two chiefs were soon met with, and the Spaniards learned that they were called *caciques* throughout the islands. The first and younger of them was timid and shy, but the second confident and accessible to every emotion. They came in procession, carried upon litters, in great pomp and with a numerous following. They went on board without distrust, and with well-bred courtesy took seats at the admiral's table. When offered refreshments, they ceremoniously tasted of the delicacies, and shared them with their attendants, who devoured them greedily. More gold was found in this island than in the others, nose-jewels worn by the women, and even thin plates, but all of small size and infrequent. No wonder that all December was agreeably spent by Columbus between Española and Tortuga, gathering information and naming the country. The first port in which he cast anchor, as fair as any of Cuba, he called San Nicolas, having landed there on that saint's day; the second he called Concepcion, the third St. Thomas. As in all the spots thus far visited, the Indians fled at the coming of the Spaniard. But when the fugitives were called back by their fellow-Indians whom Columbus had brought with him, they returned and began to examine and touch the visitors, although fighting shy of them, timorous of every gesture and frightened at the slightest sign, yet accepting the most trifling gifts with simple confidence, and exhibiting the greatest delight thereat. In Española they found a *cacique* of more importance than any before met. His name was Guacanagari. He was distinguished from the rest by his greater interest in the new order of things heralded by his guests, and by his reverential treatment of them, as though strangely forecasting the changes their advent was to bring. There were five other chiefs in the island, and Guacanagari

ruled over the northern part, where the caravels then were. At the first offers of barter he displayed a wealth and authority above what they had witnessed hitherto. The Indians had been in the habit of offering girdles to their guests in sign of friendship, and Guacanagari gave one of notable magnificence. Composed of three folds of cotton cloth, so thick and closely woven that an arquebus could scarcely have pierced it, it was ornamented with coral, shells, and pearls, and at the side hung a grotesque mask with eyeballs and tongue of pure gold. An embassy from the chief brought this gift, and Columbus spent the whole day endeavoring to interpret the signs made by the envoys in offering him all he might desire. Guacanagari was eager to see more of the Spaniards, and sent numbers of his light-hearted people to welcome them and bring them gifts of every sort. Their enthusiasm was unbounded, their generosity unstinted. The land was gay with festivities, the sea swarmed with canoes. On nearing the caravels, the Indians that crowded them stood up, tendering all kinds of offerings with gestures of devotion, as in idolatrous worship.

Beholding all this enthusiasm, Columbus despatched a formal embassy to Guacanagari, and on hearing their report he determined, despite the prevailing land-breeze, to weigh anchor and sail to the dominions of his friends, which were some five leagues distant. He set out at daybreak on December 24. Little progress was made during all that day. The night came, Christmas Eve, and Columbus determined to celebrate it, as best befitted his own health and the comfort of his own crew, by enjoying a sound sleep. He retired, worn out by three nights of vigil following three days of herculean labor. Sweet must have been his rest! His discovery of that new world whose very existence had been denied, the endless upspringing of Eden-isles, the simple races bound to nature by such mysterious ties and soon to be brought into the fold of civilization and Christianity, must have filled his mind with happy dreams on this the first restful Christmas Eve he had passed in thirty years of titanic contest with all the world, and at times even with his own self. It was midnight, when the echoes of childhood and of times long past fill the slumbering ear. The heavens smiled, and the sea was calm. The sailors slept soundly, sure of their bearings and sea-room because preceded by the little fleet of skiffs and canoes sent by Columbus to the Indian king. A ship's boy held the helm, so assured were they all of the fairness of the weather and the safety of their course—when the flag-ship suddenly struck upon a sunken reef. Columbus instantly divined his peril, and hurried on deck. With

lightning rapidity he gave orders to cut away the mast and throw the cargo overboard. But the remedy was futile; it was no mere stranding, it was a wreck. With the desertion of the *Pinta* and the loss of the *Santa María*, only the smallest and frailest of the three caravels that had set sail from Palos remained. He went on board the *Niña*, and sent a fresh embassy to Guacanagarí, giving an account of the disaster, while he stood off and on till day broke. When the chief learned the misfortune, he sought in every way to alleviate it, sparing neither means nor sacrifice. Disastrous indeed it was to face such superstitious races, who confided in the prosperity and success of the supernatural, with the slender remnants of such a wreck, which showed how the sea overcomes all created things and bows us all to its sovereign power. But the sentiment of hospitality was uppermost in that faithful tribe and in their kindly monarch. All the succor needed in that sad hour, and all requisite provision for the future, were given to the sufferers with admirable orderliness. The salvage of the wreck was piled on shore and, under the chief's orders, scrupulously guarded by the natives as though it were their own. The cargo was rapidly discharged and stored in a place of safety, without the loss of a pin's point.

On December 26, Guacanagarí visited Columbus, and, finding him much cast down, renewed his assurances of friendly aid. The discoverer thanked him heartily, and accepted his proffered assistance in furtherance of his continued discoveries. As there is no evil unfringed with good, this setback greatly aided the discoverer's plans by giving him information on which to base new explorations, and by affording him the means of cementing friendship with the natives. Indeed, scarcely had the chief regretfully quitted him when other Indians came out in a canoe, bringing gold in barter for hawk-bells. Being but a degree above nature, the Indians were attracted by all that appealed to their senses, and enjoyed the cheery tinkle of the cascabels, being used to the much less musical rattling of pebbles in a hollow stem. The chroniclers of that time mention how the Indians mingled our strange words with their native speech, as primitive and instinctive as the first chirpings of nestling birds or the bleating of nursing lambs. "*Chuca, chuca, cascabels!*" they cried, begging those gay and useless baubles with all a child's eagerness. It is narrated that some of them, bringing bits of gold to exchange for hawk-bells, gave up the priceless treasure as of little worth, and snatched the worthless toys, with which they hurried away, looking anxiously back as though fearing the Spaniard might repent his bargain. Simple creatures, and to be envied,

were they, to fancy they had tricked the Spaniards in giving gold for dross in that happy age, fitly comparable with the poetic era when riches were despised, and man was content with a handful of acorns and a draught of cool water from the crystal spring. So primitive an age seems impossible so near to our own materialistic times. "Of such cheating," says a monkish writer of twenty years later, "the Spaniards of that time were glad to have more and more day by day"; and I even think that those of our own day would not refuse to be so tricked. Anything of brass captivated their simple fancy. The clink and luster of that metal, joined to its flexibility, so charmed them that they sought it eagerly. They called it *turey* (heavenly). They offered to take it for their gold. It is needless to say that Columbus, delighted with the readiness of the Indians to give him such wealth as this for mere dross, looked upon his wreck as a heaven-sent blessing. Moreover, the *cacique* generously invited him to visit his dominions, and the reports of the gold that there abounded gladdened the discoverer's soul. After Guacanagarí had supped with Columbus on the *Niña*, the admiral supped with the chief in his *bohio*, or village. On those occasions he told him of a place called Cibao, where gold was found strewn upon the earth's surface and freely to be gathered by any comer, for the natives attached no value to it. When the admiral heard the name Cibao, he at once fancied the chief spoke of Cipango, and began to build airy castles, and to suppose himself already arrived in the coveted realm of India. On inquiring of the simple natives in regard to the inhabitants and the characteristics of that region, he understood them, in his confused interpretation of their replies, to complain of their treatment by their Caribbean neighbors, and of their terrible and unnatural voracity. Thus, owing in part to his utter misinterpretation of what they told him, and in part to the fancies of his own fertile mind, he supposed them to speak of a race as perverse in moral nature as deformed in body, having a single eye in the forehead like the fabled Cyclops, a dog's head, and a long tail, and gorging on human flesh and blood. In gratitude for the tidings they gave him of the Cipango of his dreams, Columbus promised the potent aid of his sovereigns against the Caribs, and rich rewards for the gold they offered. Thereupon he set before them the advantages of such a civilization as the Spaniards possessed, and the benefits to flow to them from its adoption. In order to demonstrate this, he put a shirt on the back of his savage friend, and a pair of gloves on his hands. Custom has decreed that the raiment shall be adapted to the form, and hence an ill-fitting garment is ridiculous in our

sight. Most laughable, then, must have been the appearance of the chief, framed for the air and light of freedom, and belonging by nature to the animal and vegetative life about him, when thus arrayed in the vesture appropriate to the highest civilization, but wholly at odds with the man as he was. Fancy an ape in human attire, and you have this savage, be-shirted and begloved after the Spanish fashion. Some idea of the primitive life of those Indians may be formed from the fact that they possessed no weapons of any kind, if we are to credit what Columbus wrote in his journal for the information of his sovereigns. This is somewhat at variance with what he elsewhere says about the constant warfare between the Haitian and Caribbean tribes; but as Columbus is the sole witness of the facts of the discovery, and as we have no evidence but his, we must perforce believe him. He adds that, the more to astonish them, he sent to the caravel for a Turkish bow and Castilian arrows, and when one of the crew showed their use, these children of nature looked upon them as miracles. Their amazement became terror on hearing the roar of the cannon and the rattle of the muskets, fired by way of salute, and sounding in their untutored ears like the awful crash of thunder in the storm. They fell upon the ground, with cries and signs of terror, as though themselves smitten with death. No wonder, then, seeing and hearing these things, that they believed in the divinity of him who could thus control the lightning and the thunderbolt. The fair skin, the look of command, the glistening armor, the manly beard, the flashing sword, the death-dealing carbine, all were so manifestly beyond aught they knew, as to render supernatural and divine in their eyes these strangers cast up by the celestial and solitary ocean. So, therefore, the Haitians knelt before the Spaniards and hailed them as their natural masters. To them any guest was sacred; how much more, then, these superhuman visitants? Columbus deemed his moral conquest of those Indians complete. Nothing more appropriate, then, than to seal it by some striking and visible sign, a castle or fortress, for example, the effective symbol of sovereignty in feudal and monarchical Europe. The timbers of the wreck served for this purpose, and the Indians so diligently helped to carry out

the design that the fort was soon raised before the eyes of those docile tribes in the bosom of that virgin land. It was called by Columbus Fort Nativity, in memory of the day of the wreck. This act of taking possession, far from dimaying the enslaved, only strengthened their loyalty to their conqueror, while it served Columbus as a means of inaugurating the conquest and disposing of a crowd of sailors whom he could not well transport back to Spain, having only the smallest of the caravels left to him, besides insuring him willing recruits in Spain to join their predecessors who had so willingly remained in Haiti. The friendly disposition of the Haitians increased with their daily intercourse. The *cacique's* brother took the discoverer to his hut, a large structure with hangings of plaited palm-leaves called *yaguas*, where he treated him with much ceremony, and reverently seated him on a long wooden settle, as big as a bed and black and polished as jet. The *cacique*, being informed by his brother of the visit of Columbus, repaired to the hut, and, after saluting his honored guest, hung about his neck an ornament of gold. It is superfluous to describe the delight of Columbus. The honors paid him did not stop here. Other *caciques* being subject to Guacanagari, he speedily assembled them and led them to the admiral's presence, all like himself wearing crowns; whereupon he, their natural chief, took off the golden circlet from his brows and set it on the newcomer's head in recognition of his supernatural authority. In return for his gold, Columbus set strings of glass beads on the neck of the *cacique*, a fine woolen cloak upon his shoulders, a silver ring on his finger, and red buskins on his feet, to the intense delight of the poor deluded creature, who prized these gauds above all earthly riches.

After receiving this vassal tribute to the mastery of the Spaniards, Columbus deemed it high time to return, and to give in person to his sovereigns an authentic account of his discoveries, as well to enable him to continue in the favor he had won as to induce them to follow up and perfect the enterprise with ampler means than those he had brought from the peninsula, and which were now much reduced by the mishaps incident to his voyage, although, by divine grace, the outcome had been most fortunate.

## COLUMBIA'S EMBLEM.

**B**LAZON Columbia's emblem,  
The bounteous, golden Corn!  
Eons ago, of the great sun's glow  
And the joy of the earth, 't was born.  
From Superior's shore to Chili,  
From the ocean of dawn to the west,  
With its banners of green and tasseled sheen,  
It sprang at the sun's behest;  
And by dew and shower, from its natal hour,  
With honey and wine 't was fed,  
Till the gods were fain to share with men  
The perfect feast outspread.  
For the rarest boon to the land they loved  
Was the Corn so rich and fair,  
Nor star nor breeze o'er the farthest seas  
Could find its like elsewhere.

In their holiest temples the Incas  
Offered the heaven-sent maize—  
Grains wrought of gold, in a silver fold,  
For the sun's enraptured gaze;  
And its harvest came to the wandering tribes  
As the gods' own gift and seal;  
And Montezuma's festal bread  
Was made of its sacred meal.  
Narrow their cherished fields; but ours  
Are broad as the continent's breast,  
And, lavish as leaves and flowers, the sheaves  
Bring plenty and joy and rest.  
For they strew the plains and crowd the wains  
When the reapers meet at morn,  
Till blithe cheers ring and west winds sing  
A song for the garnered Corn.

The rose may bloom for England,  
The lily for France unfold;  
Ireland may honor the shamrock,  
Scotland her thistle bold:  
But the shield of the great Republic,  
The glory of the West,  
Shall bear a stalk of the tasseled Corn,  
Of all our wealth the best.  
The arbutus and the goldenrod  
The heart of the North may cheer,  
And the mountain-laurel for Maryland  
Its royal clusters rear;  
And jasmine and magnolia  
The crest of the South adorn:  
But the wide Republic's emblem  
Is the bounteous, golden Corn!

## CLAUDE MONET.

WHEN the group of painters known as impressionists exhibited together for the first time twelve or fifteen years ago, they were greeted with much derision. In fact they were hardly taken seriously, being regarded either as mountebanks or as *poseurs* who served the purpose of furnishing the quick-witted but not infallible Parisians with something to laugh at once a year. But they have seen their influence increase steadily in a remarkable manner, first, as is always the case, with the painters, and latterly with the public. It is a very superficial observer who sees in the impressionists only a body of bad or inefficient painters who would attract attention at any cost except that of study. The sum total of talent represented by M.M. Manet, Degas, Monet, Pizarro, Caillebotte, Sisley, Renoir, Mlle. Berthe Morisot, and the American Miss Cassatt, not to mention others, is very considerable. Of course there have appeared the men of small talent with their little invention, who have tacked themselves on to the movement, notably the genius who imagined the fly-speck or dot *facture*, while streaks and stripes have been considered a part of the new school's baggage. All this does not take away from the fact that the influence of the movement has been a healthy and much-needed one. It is to be thanked first, of course, for its independence and revolt from routine, the *chic* and *habileté* of the schools; next for its voice in behalf of pure, bright color and light, things of which painters as well as the public are more or less afraid. That refined color must necessarily be dull color; that one should not paint up too near white; that one should "husband his resources"; and that if any qualities must be sacrificed, let those be color and air—all these theories have been stoutly and efficiently combated by the impressionists.

Of them all M. Claude Monet is the most aggressive, forceful painter, the one whose work is influencing its epoch the most. If he has not, as M. Guy de Maupassant says with enthusiasm,

"discovered the art of painting," he has certainly painted moving waters, skies, air, and sunlight with a vividness and truth before unknown. Though occasionally painting indoors, he is, in my opinion, most original as an open-air painter, and he has scored his greatest success in that line. No one has given us quite such realism. Individual, and with the courage of his opinions from the first, his work, while remaining substantially the same in intention, has become larger and freer. In the beginning there was a visible influence of Corot, and certain mannerisms which have disappeared with increasing years. Superbly careless of *facture*, or at least with no preoccupation in that direction, he has arrived at that greatest of all *factures*, large, solid, and intangible, which best suggests the mystery of nature. And all painters working in the true impressionist spirit, absorbed by their subject, must feel that neat workmanship is not merely not worth the while, but is out of the question. "No man can serve two masters," and this noble indifference to *facture* comes sooner or later to all great painters of air, sea, and sky.

Most painters have been struck by the charm of a sketch done from nature at a sitting, a charm coming from the oneness of effect, the instantaneousness seldom seen in the completed landscape, as understood by the studio landscape-painter. M. Claude Monet was the first to imagine the possibility of obtaining this truth and charm on a fair-sized canvas with qualities and drawing unattainable in the small sketch. He found it attainable by working with method at the same time of day and not too long, never for more than an hour. Frequently he will be carrying on at the same time fifteen or twenty canvases. It is untrue that he is a painter of clever, large *pochades*. The canvas that does not go beyond the *pochade* state never leaves his studio, and the completed pictures are painted over many times.

Though these details may be of some interest, it is, of course, the spiritual side of the painter's work that is really worth dwelling on. M. Claude Monet's art is vital, robust, healthy. Like Corot's, but in more exuberant fashion, it shows the joy of living. It does not lack thought, and many of his pictures are painted with difficulty; but there is never that mysterious something

THE HOME OF MONET AT GIVERNY, EURE.

which often gets into a picture and communicates itself to the spectator, a sense of fatigue, or abatement of interest in the motive. There is always a delightful sense of movement, vibration, and life. One of his favorite sayings is "La Nature ne s'arrête pas." Clouds are moving across the sky, leaves are twinkling, the grass is growing. Even the stillest summer day has no feeling of fixedness or of stagnation; moving seas, rivers, and skies have a great charm for him.

The exhibition at the Rue de Saxe last summer was a surprise to many from the variety, rare in a collection of pictures by one painter. Those who knew M. Claude Monet only as a painter of sunlight saw him in a new vein in the somber, rocky hillsides of La Creuse. There were Paris streets and gardens, gay in movement and color, railway-stations, Holland tulip-fields, and Normandy winter landscapes. One, of grain-stacks in the early morning, with a thin covering of snow, was a most extraordinary piece of realism. Then the sea, for which he has a lover's passion, seen from the Normandy chalk cliffs dazzling in sunlight, blue and green shadows chasing one another across its surface, or the stormy waters and black rocks of Belle Isle. And his "Essais de Figures en Plein Air"—

what charm of color and life! how they belong to the landscape in which they breathe and move! To my mind no one has yet painted out of doors quite so truly. He is a realist, believing that nature and our own day give us abundant and beautiful material for pictures: that, rightly seen and rendered, there is as much charm in a nineteenth-century girl in her tennis- or yachting-suit, and in a landscape of sunlit meadows or river-bank, as in the Lefebvre nymph with her appropriate but rather dreary setting of "classical landscape"; that there is an abundance of poetry outside of swamps, twilights, or weeping damosels. M. Claude Monet's work proves this fact, if there be need to prove it: that there is no antagonism between broad daylight and modernity, and sentiment and charm; that an intense lover and follower of nature is not necessarily an indiscriminating note-taker, a photographer of more or less interesting facts. Beauty of line, of light and shade, of arrangement, above all, of color, it is but a truism to say that nowhere except in nature can their secrets be discovered.

M. Claude Monet's art leaves few indifferent. There is a whole gamut of appreciation, from the classicists who abhor him,—as Ingres is said to have spat at the sight of a Dela-

croix,—to M. de Maupassant, whose judgment I have already given. He is often aggressive, sometimes wilfully so, and you feel that he takes a delight in making the "heathen"—*i. e.*, Philistine—"rage." There is always need of such work and such painters. His work is quite as often sane and reasonable, and should interest all who love nature. His painting, direct, honest, and simple, gives one something of the same impression, the same charm, that one gets directly from the great mother—Nature—herself.

One cause of the popular prejudice against impressionism is the supposed wilful exaggeration of color. No doubt restrained, negative

and colors than we; that they had, in fact, a simpler and more naïve vision; that the modern eye is being educated to distinguish a complexity of shades and varieties of color before unknown. And for a comparison, take the sense of taste, which is susceptible of cultivation to such an extraordinary degree that the expert can distinguish not only different varieties and ages of wine, but mixtures as well; yet this sense in the generality of mankind, in comparison, hardly exists. In like manner a painter gifted with a fine visual perception of things spends years in developing and educating that sense; then comes the man who never in his life looked at nature but in a casual and patro-

BORDIGHERA.

color pleases better the average mind, and only a colorist and searcher can use pure, vivid color with good effect, as Monet certainly does. That there is more color in nature than the average observer is aware of, I believe any one not color-blind can prove for himself by taking the time and trouble to look for it. It is a plausible theory that our forefathers saw fewer tones

nizing way, and who swears he "never saw such color as that." Which is right, or nearest right?

Another cause has been its supposed tendency toward iconoclasm and eccentricity. But in reality, while bringing forward new discoveries of vibration and color, in many ways the impressionists were returning to first principles. Manet's "Boy with a Sword" and

the much discussed "Olympia" may claim kinship with Velasquez for truth of values, and for largeness and simplicity of modeling, while the best Monets rank with Daubigny's or, to go farther back, with Constable's art in their self-restraint and breadth, combined with fidelity to nature.

While the movement is much in sympathy with the naturalistic movement in literature, yet I should rather insist on its resemblance to that brought on by Constable. In independence of thought and intense love of nature, in the treatment received from public and critics, and in their immediate influence on the younger painters of their day, there is a remarkable similarity between Constable and M. Monet. In Leslie's "Life" Constable preaches

Perhaps the sacrifices I make for lightness and brightness are too great, but these things are the essence of landscape."

In 1824 some of his landscapes exhibited in Paris made a sensation. The French artists "are struck by their vivacity and freshness, things unknown to their own pictures—they have made a stir and set the students in landscape to thinking. . . . The critics are angry with the public for admiring these pictures. They acknowledge the effect to be rich and powerful, and that the whole has the look of nature and the color true and harmonious; but shall we admire works so unusual for their excellencies alone—what then is to become of the great Poussin?—and they caution the younger artists to beware of the seduction of these English works."

ON CAPE MARTIN, NEAR MENTONE.

against *chic*, then called *bravura*, "an attempt to do something beyond the truth. Fashion always had and always will have its day, but truth in all things only will last and can only have just claims on posterity." "The world is full enough of what has been already done." "My execution annoys the scholastic ones.

But a few years later the younger artists began to profit by Constable's ideas, and the noble school of 1830 appeared, carrying the art of landscape-painting another step in advance.

It is not perhaps too soon to prophesy that in the same manner the influence of M. Claude Monet on the landscape art of the future will

FROM THE PAINTING BY CLAUDE MONET, IN POSSESSION OF F. H. FULLER.

THE ORCHARD.

be strongly felt. Imitation can go but a little way, and is always without value, although its appearance is no argument against the art imitated — witness M. Trouillebert. But as the young Frenchmen of 1830 profited by the example of Constable, his discovery of breadth

and values as we understand them to-day, so will the coming landscape-men use the impressionist discoveries of vibration and the possibilities of pure color, and, while careful to “hold fast that which is good,” will go on to new and delightful achievement.

## TWO POEMS.

### AN IMPULSE.

THE silent little glen I often seek,  
 Moist, dark : a tiny rivulet runs through  
 The lush, wet grass, so small a silvery thread  
 That one might take it for a line of dew.  
 The trees have shut it in a sylvan room  
 Full of chill earthy scents. Diana might  
 Choose such a spot to don her huntress garb,  
 Or stretch her cold, chaste body there at night.  
 And yet to-day, thou thing of Eastern suns,  
 The very contrast of the place to thee  
 Made me look up, and through the undergrowth,  
 With the wild dream that thou hadst come to me !

### MELODY.

WHEN the land was white with moonlight,  
 And the air was sweet with May,  
 I was so glad that Love would last  
 Forever and a day.

Now the land is white with winter,  
 And dead Love laid away,  
 I am so glad Life cannot last  
 Forever and a day.

# THE CHOSEN VALLEY.<sup>1</sup>—V.

BY MARY HALLOCK FOOTE,

Author of "The Led-Horse Claim," "John Bodewin's Testimony," etc.

WITH PICTURES BY THE AUTHOR.

XV.

MARGARET had been able to choose her successor, a young woman who presented herself with an appositeness which might have been called providential but for the drawback of a ten-months-old baby. Margaret made light of the baby in comparison with the baby's dire alternative, a Chinaman; and the family assented. No one likes to think one's self so inhuman as to mind a baby. A baby, Margaret claimed, steadies a young woman and gives her ambition; she had seen a slender bit nursing mother go through the same work, and find time to rest and tidy herself, that "twa jaukin' hizzies wad be dallyin' with the lee-lang day." The young woman's husband was busy, like Job, getting his land in shape for the water, which had been promised by the following spring.

ENGRAVED BY C. STATE.  
"DOLLY WAS SERVING A HOUSEKEEPER'S APPRENTICESHIP."

It was several weeks before the admis-

sion crept out that the baby was getting oppressive. They continued to give themselves credit for the feelings proper to the baby and to Jenny, who was doing her best to combine her natural duties with those for which she was paid. The baby was a splendid, great, fair, brown-eyed boy baby; they were the ideal settler's wife and child, the very people for whom the canal was building. All this made it harder to confess that so appropriate a connection was far from comfortable. Dolly, who had entered with girlish enthusiasm into the scheme, had won Jenny's heart at the outset by her sweet, inviting ways with the baby, of whose position in the family the mother was naturally jealous; but Dolly's success was her own undoing — the baby screamed to go to her whenever he saw her in the distance. She had pleased him too well; she had rashly admitted him to her own part of the house, far more attractive than the kitchen, and thereafter, short of downright forcible expulsion, he was not to be denied. He could creep faster than a clock ticks, and as, in the summer weather, doors were left wide, the sound of his scuffling toes and his bubbles and guggles of delight became a comic source of terror. She felt constrained to keep up her character, too ambitiously assumed. She sympathized with Jenny, and tried dishonestly to persuade her that the baby was no trouble to any one; and between specious protestations to the mother, tyrannous exactions on the part of the baby, and her own secret dismay, Dolly's path became daily more complicated and arduous.

Philip despised the baby because it took up precious moments of Dolly's time that he had formerly been able to monopolize. Dunsmuir found all his autocratic habits trampled upon by that terrible, sunny-headed radical, who was always underfoot when he was not in Dolly's arms, or swinging by his mother's skirts, or pulling things off the kitchen table, or mixing himself up in squalid fashion with the sacred ceremonies of dinner, or digging holes in the flower-beds, or strewing the piazza floor with his idols,—bits of coal or chicken-bones or mumbled crusts of bread,—and leaving indispensable parts of his clothing about in conspicuous places, to be hastily gotten rid of or futilely ignored. The young settler had a habit of screaming at meal-times, occasions which seemed to excite him and to remind him of his own infringed rights. Jenny would dash in and out with a flushed face and a high-strung manner, the tension of her nerves increasing with the baby's notorious demands. In her brief disappearances she would catch him up violently and remove him farther and farther from his audience in the dining-room, scolding till both his heart and her own were quite broken. When his

cries came forlornly from his place of banishment in the woodshed, Dolly, unable to bear the appearance of heartlessness any longer, would rise to the rescue, and the meal would end distractedly for all. Dolly began secretly to dislike the baby, almost to wish some reasonable fault could be found with Jenny as an excuse for terminating a relation so exposing to all her own unsuspected weaknesses. It was humiliating to think how little Margaret would have made of this pother about a baby. Her hands would never have been too clean, nor her gowns too fresh and fine, to nurse him, the young rascal, when his mother needed relief.

It was helplessly agreed, in the family, that to send away Jenny for no fault but that she was a mother would be too monstrous; but they were ripe for any desperate measure of relief. Jenny had a young sister, a lass of twelve, whom it was now proposed to have up from town, to mind the baby, and betimes to help Jenny with her work. But wages, it proved, were no object to Jenny's parents compared with the loss of a winter's schooling for their youngest daughter. They were a nomadic, tent-and-wagon family, and therefore the more regardful of educational opportunities when they came in their way. In extremity, Dolly offered to remove the difficulty by herself undertaking to teach the lass; and so it was arranged. Two hours each day she gave to the sowing of seed on that wild and stony soil, and very profitable, on the whole, was the exercise—to the teacher. But Philip rebelled against these baffling and separating influences. The atmosphere of the household was changed; it was no longer feudal and concentrated. Other matters besides the work had started up with much intrusive bustle, and Dolly was serving a housekeeper's apprenticeship instead of falling sweetly and securely in love.

On one of the evenings when Philip dined in town chance presented him with an awkward discovery. Alan had gone with a party of young girls to a play given by a traveling company. Philip was not much concerned for the lad's sentimental relations in these days, although the latter confessed to having returned Antonia Vargas her bullet; the confession being incident to his having had to borrow of Philip to pay for mounting the same. He claimed to have sent it partly as a joke; a trifle fervid in the accompanying sentiment, possibly, but a girl accustomed in her own language to the metaphorical kissing of hands and feet could not be supposed to take umbrage at a word, though strong.

He had cudged his wits for days, he said, and looked through stacks of books for a text not exceeding in space one inch of en-

graver's small script; but nothing could he find to the purpose of a wound but that stale bit of Latin. Virtue would not go, of course, and gratitude had sounded a trifle prudent. Such had been Alan's explanation, if sincere, and Philip had no reason to doubt him.

He was smoking at the window of his bedroom in the wing opening on a grass court in rear of the house. On the kitchen porch below Enrique was conversing with a shy figure lately

heart. You would confess to the devil himself if that were the only road to marriage with Antonia."

"I was a fool to venture back so soon; I should have waited till matters were quiet. But I died, Enrique, thinking of them together in that cursed pit!"

"It was a meeting of your own contriving."

"I tell you it was not. Did I invite him to the cave? Once there, what could I do with

THE LETTER OF RESIGNATION.

ENGRAVED BY H. DAVIDSON.

known on the streets of the town as a peddler of tomares. She was a bent old woman with a brown face, which she kept well hidden under the peaked hood of her invariable black shawl. Twice a week she brought tomares and enchillalas to the house, and gossiped with Enrique. Without paying much attention, he caught the monotonous cadence of their voices, until a sentence distinguished itself, remarkable enough, coming from the vender of tomares. Enrique had asked her a question, and this was her answer:

"The Father says that I am still in sin; he cannot give me absolution. I think it is merely an excuse to put off my marriage with Antonia. I am not worse than others that he should distinguish against me."

"You are wrong to say that of the Father, Pacheco. He knows that confession such as yours comes but from the lips, not from the

him? Set him free, and he would prattle of what he had seen, and they would hunt me like a badger. Keep him with me? There was not food enough for two. There was scant for one till Antonia should arrive, at the time appointed. The pity was that I had bowels and left him the key to the well, or that I did not crack his skull a little harder when I threw him in the cave."

"A pity to spoil a better case than your own. He has the face of the blessed St. Michael."

The tomale-woman shook in her bundled rags like a sheaf of withered corn. Her words were a choking growl.

"Bah! the boy is not a madman like you. He is not bitten to the soul." Enrique spoke. "Antonia may never have looked at him but in compassion, as the angels might, seeing the state she found him in. The keys of thy cave were a candle to the blind. Had she been

a day later he had not been worth loading a pony with."

"You have fattened him till he could carry the pony himself, now."

"All I ever said was"—Enrique spoke again—"he has looked at her. Very good; so has many another long-legged coxcomb about the town."

"And I am forbidden the house till her father's return."

"Yes, but you art her *novio*, wolf in sheep's clothing."

"If I am a wolf, what is he?"

"A very white little lamb beside you. If he sees her, it is in the American fashion, which means anything or nothing." Enrique's shoulders went up; his hands said the rest. "Extraordinary people! He has gone with three of them to-night, his little countrywomen; not a gray hair nor a wedding ring in the company. You might hear their parrot voices screaming the length of the street. With him it is not Antonia; it is any girl."

"I am in hell with thinking on them."

"You will get there fast enough without so much thinking."

PHILIP reported this conversation to Dunsmuir. It was agreed now that Alan should be sent away; but where?

The family wound still rankled. The family itself on the other side had greatly changed in fifteen years. The present members had their own burdens sufficient to their incomes; correspondence had nearly ceased.

"Chuck him into a big school, and let him strike out for himself and learn his insignificance," said Philip.

"Send him to heaven if you happen to know the way!" was Dunsmuir's answer. The American schools were all alike in his estimation, skin-deep in scholarship, vulgar in tone, inordinately expensive.

Then Philip somewhat diffidently proposed the Continent as a compromise, with his mother's assistance in placing Alan at Zurich or Vevay. She would dote on another boy to "run" in vacations; and Alan would find it not so disagreeable to be preached to by an adorable woman old enough to be his mother, who, as she was not his mother, would know when to "let up."

To his surprise, Dunsmuir fell in with the proposition at once. Philip cabled his mother, and wrote, sending Alan's picture; the lad's good looks, he well knew, would be a great point in his favor. Meantime Philip talked to him like an elder brother. He could have wished to see him more touched in temper, and less placidly flattered by the attention his pastimes excited. Dunsmuir raved over the cost;

a cool thousand it meant at the first go off, and he had promised his next surplus to Job, who needed the money at once on his land. No matter; the old people must wait. From those that have not shall be taken even that which they have. Dunsmuir felt the want of money all the more, now that he had begun to straighten his affairs and to handle a salary again. He was impatient to be free.

Pacheco had been arrested. Vargas had returned with his mules from Sheep Mountain, and was looking after his daughter. Alan was on parole. Dolly was cold, and would not talk of her brother. Her shame for him went hard with her; it was like a bilious sickness. She was for abjuring sentiment henceforth in any and every form. Away with it all! The lights were out in her own secret place of worship; cold daylight showed the images to be mere tawdry dolls; her flowers of passion were turned to rags and shreds of tinsel. Not one kind word could Philip get from her in her revolt; not a single acknowledgment of all that had so nearly come to pass between them.

## XVI.

THE river was now at its lowest. Cofferdams were in place, which were to cramp it and turn it aside, and at night, when the pile-drivers, and the steam-hoists, and the dump-carts were silent, the harassed stream made loud its complaint. Dunsmuir's orders were to "go ahead" and put in his dam on a pile foundation where the rock gave out, that water might be turned into the ditch by May 1, in time to reap the next season's crop of contracts. Dunsmuir had protested in vain against the issuing of contracts which called for this early delivery of water. He had submitted his own plan of the dam—excavation till solid rock should be reached, that the masonry might rise in one coherent mass from a permanent and homogeneous foundation. But such construction demanded more time than the contracts were giving him.

"What 's the matter with piles and concrete?" Norrisson had asked; and he mentioned several dams with pile foundations that were doing their duty. While in Denver, soon afterward, he took the occasion of meeting a friend, an engineer of reputation, to put the case of the Wallula dam, and asked his opinion. The engineer gave it, unofficially, on the facts as Norrisson presented them; he said that a pile foundation would serve. Norrisson quoted him triumphantly to Dunsmuir, who was unshaken, though considerably irritated by Norrisson's methods of warfare. If he had wanted a consulting engineer, why had he not retained one and got his report after a personal examination?

The argument ceased in words. A few days thereafter Dunsmuir received an official communication to the following effect :

DEAR SIR: It will be necessary to proceed immediately with the construction of the dam, in accordance with the plan suggested by me and discussed in our last conversation. You may consider this authoritative. Very truly yours,

PRICE NORRISSEN,  
*Manager.*

ROBERT DUNSMUIR,  
*Chief Engineer.*

Such an order from the manager to the chief engineer precisely indicated the relation between them, as Norrisson intended it should. The chief's resignation was in order, else he would remain as the servant of the company, not the responsible agent of the work. In his first outburst of indignation Dunsmuir wrote such an answer as the situation demanded. It was some consolation to watch Philip's face while he read it aloud to him with satisfied emphasis.

"Understand, I don't make it personal." Dunsmuir looked kindly, almost fondly, at Philip, who had not a word to say. "It is the old issue that parted us the first time. It has parted better friends than your father and I ever pretended to be; and I don't say the alternative is of his contriving. I was my own promoter some weary years; I should know something of the difficulties on that side. But my choice is plain. I must stick to the first principle in our profession, Philip: the honest builder can wait, he can fail, he can starve; he cannot botch his work. I speak for myself, who am the only one accountable."

"I shall leave the work when you do."

"I don't see that you need; and I should be as jealous for you as for my son."

"I shall go with you, sir, for the sake of adding my protest, and because of what you have just said."

"There are moments of defeat worth more than many a victory," said Dunsmuir.

But in the silence of night, when consequences obtrude, he revised his decision. No man may be captive, even to his own will, for as long as Dunsmuir, without suffering the prison change. If Norrisson's company owned the scheme, the scheme owned Dunsmuir; and he knew it now. He thought of his debts; of his children, restless and half-educated; of his forsaken connections in the world that no longer knew him. A morbid dread of change had grown upon him; his fixed life had singularly, appealingly unfitted him for a fresh start. He had lost the habit of society; he was out of touch with the new movements in his profession; he had no elasticity, no imagination,

no conviction left for any new work so long as he was chained to this. He knew his bondage at last, and his soul cried out against it; yet he could not go forth, a penniless, broken man, with the scars of failure upon him. He had worn out his powers of waiting. A specious victory had granted him the respite of three months of action in command of forces he called his own; he could not bear now to feel the screws take hold again in the same old shrinking places.

Then followed those lower considerations that lie in wait for moments of irresolution to worry the doubting heart. The truth concerning his resignation would never be known. Gossip would have it, in circles where an engineer's reputation is discussed, that here was a presumptuous dreamer who fancied himself called to a great work, who, after more than a decade spent in contemplating it, was found unequal to the initial problem of its fulfilment. How he hated that word theorist! there was nothing he so loved as to be considered practical. Now, the practical man would be his successor. He would reap the honors should the dam stand; if it went out, how easily the blame might be shifted back upon the theorist. Dunsmuir was well acquainted with the dark side of his profession—the long waitings, the jealousies, the wrested honors, and the bitter rewards. He knew how a man's one mistake may follow him to his grave, while his successes are forgotten or credited to another man.

At daybreak, when the wind fell, and with it a silence upon the sleeping house, he stole out from his bedroom to the office, and abstracted his letter of resignation from the post-bag. His decision was already reversed, yet he hesitated before the act that should cancel all that brave talk of the night before.

Yet why assume that it was a betrayal of the work? What are the risks that success will not justify? It was well enough known in the history of engineering that there is an heroic margin outside the beaten track of precedent which bold spirits yet may tread. He was half angry with Philip, now, as he thought of their conversation, that the younger man should have seen no way out of the difficulty but his chief's resignation. Decidedly Philip was too conservative. Of what use to be twenty-three and an American! The letter was torn into bits and went into the waste-basket, and Dunsmuir sat out the dawn, and heard the house awake, scarcely moving, face to face with the first deep, secret humiliation of his life. By breakfast-time he had got his most presentable arguments in order. He sat working them, in silence, during the meal, and when it was over he summoned Philip into the office, and said to him coldly:

"I have called a halt, Norrisson. It is too

late now to back out of the work ; it would be desertion. I do not give orders here, it seems, but that is the fortune of war. They have captured my scheme by the strong arm. They can make what hash of it they please ; but for better or worse I stay with it, and pride may go to the dogs. My pride shall consist in making the dam as strong as their infernal meddling will let me. If it goes, at least I shall know all was done that could be done with such a management in the saddle. I know no fathers or fathers' sons in this business. It's a fight, and they have won. Let them make the most of it."

There was little Philip could say not seeming to remind Dunsmuir of his recantation. Dunsmuir understood him. They spent a bad day, each inside his defenses. The pause in the work left them conscious of each other's presence as a burden in the room where they had labored and argued together harmoniously. Philip brought on the explosion by a restless allusion to Dolly. He was always trying the ice of Dunsmuir's doubtful sanction, boy-fashion, to know when it would bear. To-day he ventured too far ; it cracked without warning ; it thundered from shore to shore.

Philip had hazarded a nervous expression of the hope that, whatever grinds or hitches should come to the work, the peace of the relation might stand ; and since men do not usually mean each other when they talk in this strain, Dunsmuir became fidgety and Philip more nervous.

He had never had a home life before, he awkwardly expatiated, unsupported by a sign of encouragement from Dunsmuir, even for as long as he had lived in the cañon ; never known a girl in her home as he had been privileged to know —

He paused, and Dunsmuir growled : " I don't know where you got the privilege. The home is one thing, the office is another."

Philip, seated on the table-ledge, thrust his hands into his pockets to hide that they were trembling. " The distinction comes a trifle late," he said.

" I will thank you to take note of it now. We have worked together well enough ; my daughter is another matter."

" She is to me."

" What is she to you ?"

" She is the girl I hope, with your leave, to marry."

" And how long have you had this hope ?"

" I hardly know," said Philip, white with stress of feeling. " I have been trying, for some time, to speak to you."

" I don't know what has prevented you. Are you sure you have not spoken to her ?" Dunsmuir laid his keen blue eyes on Philip's conscious face.

" Ye have spoken ! Deny it if you can." His big voice rang as clear as a sheet of iron under the hammer.

" Why should I wish to deny it ? It is the American way to speak to the girl first ; her answer is the only one any man would take."

" I know nothing of your American ways. But if you have spoken to my motherless child before that you spoke to me, ye have done me a treachery worthy your father's son ; and you may quit my house !"

Philip jumped to his feet, and the table recoiled with a loud jar ; for a moment there was no other sound in the room. Then he said, striving for self-control : " I don't know whether you consider yourself in a position to insult my father ; but I am in no position to answer you as your words deserve. As my father's son, or as anybody's son, my record is before you. By heaven ! I don't know why fathers should be so arrogant. A father is not a god. If you are the one appointed to look after Dolly, it's not my fault if you have neglected your business. No, sir ; I will finish now. I found her here where you had fixed her, at the mercy of your scheme. I was first, and I took no advantage that was not simply a man's. If I don't deserve her, do men generally deserve the girls they marry ? None the less I mean to make her love me, if I can. I am not called traitor for nothing. I shall take all the chances now, whatever comes."

Dunsmuir listened coolly to this explicit though somewhat mixed defiance, and smiled to himself, " The lad has spirit, after all." His eyebrows went up like clouds after a storm ; a gleam of humor tugged at the corners of his grim mustache. He held, with most short-tempered men, that you cannot make a double-dealer forsake his guard ; anger being like drink, in that it exposes a man. When, therefore, he had seen this smooth-mannered son of the " commissioner " in a fine, loose-tongued rage, — with his jacket off, so to speak, — his own tall mood unconsciously subsided. Presumably the charge of treachery had not come from very deep.

" We have taken a hot day for it," he remarked, with moderation, while Philip's mental reflection was that he would be happy to punch his much-desired father-in-law's head.

Dunsmuir filled his pipe, thrust his hands into the pockets of his loose riding-breeches, and strode out upon the blazing porch, where the western sun, barred by shadows of the pillars, lay half across the floor. The seat of his wooden chair was as hot as a hearthstone ; he kicked it away, and took a canvas one, stretching his long length on it, with a loud, obtrusive yawn. He was in one of his man-childish moods, not so lovely and pleasant as he might

have been. It might well be doubted if at Philip's age he had thought greatly of father's rights himself.

Philip went about his preparations for leaving with the haste Dunsmuir's hint demanded. But he proposed to retreat with his baggage in good order, not to have his things hurled after him. He swept a place on the office table, which he heaped with small effects from drawers and pigeonholes. Then he shot out across the hill bareheaded to the tent where the junior assistants worked, returning with an armful of drawing-tools and rolls of paper.

"I suppose I may take these—copies of my drawings for the head-works?" He indicated, without looking at his chief, a roll of photographic blue-prints.

"Take anything you want."

Half an hour later Dolly heard him in the attic chamber, dragging trunks about furiously; he was making a lane for his own, which were stowed far back under the eaves, bitterly recalling meanwhile how he and Dolly had discussed their location three months before. They had been civil to each other in those days, and Dolly had insisted that he should take the high part, as he was tall, and he had refused because he went less often to his trunks than she to the family chests. No talk could have been smaller, but it was a thing to remember now when all the little homely intimacies were at an end. Already the spent days and bygone evenings began to glow and shine like memory pictures in the retrospect. Under the eaves the temperature was near to that of the stoke-hole of a steamer. Dolly opened the door, letting in a breath of freshness and a vision of herself, on a bright background, in a thin blue muslin frock.

"Leave it open, will you, please? I want the light," Philip panted.

"What are you looking for? It's frightful in here; can't you wait till evening?"

"I shall not be here this evening."

"Going to town again?"

"I'm going to leave."

Dolly appeared to be closely considering a veil of dust-laden cobweb that wavered from the nearest beam.

"To leave the cañon? Dear me! Jenny must sweep this place," she parenthesized.

Philip gave her no answer. Down came a trunk on top of another trunk with an offensive slam.

"I did n't understand you. Are you going on some other part of the work?"

"I have left the work."

"I suppose it's none of my business why?"

"It is; and I don't mind telling you. I've been fired."

"Not from the work?"

"Not precisely; only from the house."

"I don't believe it. There must be some mistake. It's the silliest thing I ever heard," cried Dolly, indignantly.

"Silly if you like, but quite true. Your father's language is plain."

Here Philip grappled with a trunk, hurling his weight upon the handle; the bulk gave way more quickly than he had expected, he lurched forward, rose too suddenly, and his bump of self-esteem smote the rafter overhead with a blinding crash. He dropped sidewise on the trunk, and clutched his head, setting his teeth upon the brutal pang. As if that were not enough, Dolly, sickening at the sound of the blow, began to "poor" him and pity him with all her might.

"Oh, how it hurts!" she moaned, as if the head had been her own. She dropped on her knees before him, and begged to see the place. He shuddered, feeling her cool hands take soft hold of his throbbing wrists, and the natural man in him demanded that he snatch her instantly and kiss away the anguish of his double hurt. Why not be the traitor he had been called? But the barbarian was not on deck this time; he subsided, with a groan, which Dolly thought was for the aching head.

When Philip looked up, frowning and blushing with pain, and his clouded eyes met hers brimming with purest mother-pity, he blessed God that he had not wounded her innocent trust, or blotted the memory—all that was left him—of their perfect days together in the cañon.

He gave thanks again, that afternoon, when Dunsmuir made overtures of peace on magnanimous terms, including a withdrawal of all uncertain charges.

About four o'clock the up-cañon wind, fore-runner of a dust-storm, began to blow. The women ran about, shutting doors and windows, and Dunsmuir was driven in from the porch. Dead leaves, chips, bits of paper, whatever was detachable, drove past the house, whirled in the murky onset of the storm.

Dunsmuir heard the hammock slapping the piazza-posts; the willow rockers slammed to and fro; one went over with a crash, and the front door banged wide, filling the room with dust. Every day for six weeks Dunsmuir had meant to fix that latch; he cursed it now, and went outside to pick up chairs and pile them to leeward, locking the door after him in the teeth of the storm. Half his letters and papers were on the floor, and where he stepped to pick them up he left prints of his feet in the dust.

Philip came down-stairs, pale from his hurt, with bloodshot eyes. He was dressed for the road, and carried a canvas covert-coat on his arm. A transit-book he had forgotten showed

in the inside pocket; he drew it out and tossed it on the desk.

"I'll send you those vouchers to-morrow," he said to Dunsmuir. Then he asked which of the men should drive him to town.

"Sit down." Dunsmuir looked at him hard. "You can't start till this is over." He went out and gave an order in the kitchen, which was followed soon by Jenny with beer and biscuits.

Philip would take neither, and Dunsmuir finished the beer himself, feeding the biscuits to Jenny's boy, who had tagged his mother into the room, and declined to be peacefully evicted. Every few mouthfuls the child paused in his copious eating, and pointed to the chimney, saying: "Hark! Win'!"

"Right you are, mannie. Wind that would take the hair off your head if you were out in it. Now the little beggar's choking! Save us! where 's that woman?" Dunsmuir picked up the child by his garments, coughing and spluttering, and handed him out of the door like a puppy.

"Have a pipe?" he suggested affably, when peace was restored, with the sound of the wind asserting itself.

"Thanks, I don't care to smoke," said Philip.

"What 's your quarrel with the work, man? I never said you could not do your work."

"I never said you did. If you had, it would not have been true," Philip answered roughly.

"Then why do you quit it?"

"Should you care to work under a man that had called you a traitor and the son of a traitor?"

"Tush! you would have it. You brought it on yourself. Ye knew I was hit between wind and water, and the less said about that the better. But you need not have come purring after my daughter."

"The time was ill chosen, I acknowledge; but the fact remains," said Philip.

"Let it remain, then. There's no occasion to meddle with it. You did not come here to make love to my daughter."

"I had not done so—not more than I could help—when you opened on me. But you have relieved me of my scruples. I intend to give my mind to it now."

"You said that before. Now suppose we talk sense. It's ill changing horses when you're crossing a stream. I don't deny that I'd rather have you than another on this job, now we've started in. There's little time to waste, and I might be a month wiring back and forth for a man to fill your place. Stay where you are, and behave yourself cannily, and when the right time shall come, maybe we can talk of it and keep our hair on. I would see first if you are a man of your word as well as your work. What's six months to

serve for a lassie! When the work is done, when the dam is in, why, then, if I am content with the way you have borne yourself, we'll speak of this again. This is no time for marrying or giving in marriage."

"I am willing enough to wait," said Philip, "if the terms of waiting are not made impossible."

Dunsmuir smiled. "You may look at her in reason, so far as is needful to keep out of her way. No, no, lad; ye shall be friends. Make each other's acquaintance, but keep to the windward of promises and—and such toys. I have some notion of a man myself. I'm not taking you on trust altogether—and I'm not so ruthless, nor so careless of my household as you've had the insolence to insinuate. Now, shall we take a fresh grip of the work? It would be a waste of good material for you and me to quarrel."

They looked each other in the eyes hard and long. Then Philip went to the mantelshelf and filled him a pipe, and they smoked together in silence, while the wind fell, and scattering gleams from the low sun showed lines and surfaces of dust like fine ashes that toned the colors of the room.

"But am I not to have leave to explain?" asked Philip, frowning over the match with which he was lighting his second pipe. "Not a word before the shutting down? Consider, I have told her—"

"You have told her enough, I have little doubt. I'll do the explaining myself."

"But she will think—"

"Let her think, and let her fash herself with thinking. Philip, I mean this in fair kindness to you both. If the lassie cannot bear with a touch of doubt beforehand, do you think you'll be able to satisfy her hereafter? Let her think, and let her misdoubt and upbraid you in her thoughts. It's what you well deserve, if I know what young men are. A little thinking beforehand will do you both no harm.

## XVII.

THE false position on the work began to make itself felt. Dunsmuir settled into a cynical tone, which he held from this forth: that the new plan was well enough; that the dam would stand; that he had been over-conservative, but was not hidebound or wedded to a method. He rather implied that Philip was. There was a ghastly amity between the chief and the manager, which Philip blushed to behold.

The work went on, but the light of a fine enthusiasm was gone. The changed atmosphere pervaded the house. Dolly guessed that her father and Philip disagreed about the work, and that Philip had been sullen in yielding.

She had her own hesitations concerning Philip. Alone with her judgment of eighteen, she put this and that together and asked herself what such things meant, and Philip read the doubt in her transparent face. He yearned to make himself understood. He knew and half despised his graceless advantage, first as he was, and strong in the indispensable offer of that comradeship for which her bright nature was starving. He knew that she was the child of solitude, which makes sensitive and weakens the nerve, and darkens the chamber of the imagination, through which pictures are printed on the soul.

Yet he was not brave or generous enough to wait and to trust to win her in an open field. Who was he that he should measure himself with the world—ringing with men, with the confusing shibboleth of art and culture, with the pride of modern life, as Dolly could barely conceive it, and with those most subtle temptations which beset a girl of spirit through her longing to excel? Therefore Philip made the most of such chances as his contract left him free of, and few men could venture to blame him; and if Dolly did not understand, it was her bashfulness and inexperience that defeated his efforts to make her.

Dolly was hearing gossip in these days. It touched the fabric of her dreams, and made the appearances which were supposed to be the facts of her life more puzzling than ever.

"You like Mr. Norrisson better than you did; not so?"

It was Friday morning, and Dolly was dusting in the office, under her father's jealous supervision, lest she carry her ministrations too far.

"Not so?" he mimicked; and Dolly, remembering that the phrase was one of Philip's, turned a vexed red.

"Well, well, keep your blushes! All our speech is but imitation. What was the question?"

"It does n't matter."

"It matters that you pout like that at a word. Come, repeat me the question!" He caught her hand as she passed his chair and drew her down into his lap. She cast her arms about his neck, and burst into tears. Dunsmuir expostulated in awkward man-fashion, and cried, "Come, come!" and tried to raise her head and to make her speak. She dived into her skirt for a handkerchief, and, finding the pocket empty, begged in an abject whisper for her father's. He gave her his ample silk one, and she settled her face into its folds for a good cry. Already she felt better; but Dunsmuir was thinking severely.

"Are you keeping something from me, Dolly?"

"No; I have nothing to keep," said Dolly,

forlornly. "I wish—Margaret—" She could not bear the piteousness in her own voice, and a fresh burst followed the effort to speak.

"Yes, yes; I quite understand," said Dunsmuir, soothingly. "We are all out of kilter since Margaret went. She has spoiled us, every one. But I have been proud to see how you buckle to the housekeeping. Why, Margaret herself would never believe it. But maybe you're not mindful enough of your own strength?"

Dolly shook her head, and nestled closer in response to these paternal blandishments.

"Forgive my sulking," she apologized. "All I asked was, Do you not like Mr. Norrisson better since you've known him better?"

"I have always liked Philip Norrisson in a way."

"I mean the father. Is he the same man, or is he changed—or are we changed?"

Dunsmuir put the girl gently off his knee, and wheeled about in his screw-chair facing his desk. "Come, come!" he said. "Get these shelves in order before you forget where the boxes belong."

"Can you not spare me a few minutes? We scarcely ever talk by ourselves any more. I hear a word here and a word there, and every word is a fling at the name of Norrisson." She stood up and braved the blush that mounted to her face as she spoke. "Once it was Margaret, now it is Jenny, and even Adeline must have her say, and they are people only lately in the country. What is it that's so well known, and why do we have to condone it?"

"If you are not above picking up tales in the kitchen," Dunsmuir interrupted.

"Do you call Margaret 'the kitchen'?"

"Margaret cannot speak a word without prejudice, nor ever could since I have known her."

"Has it been prejudice with you, then, father? Since I can remember,—until very lately,—you have made no secret of your disdain of Mr. Price Norrisson and all his works. It is a prejudice your women were brought up on. Has there been some mistake?"

"The mistake is that you should perplex yourself with the matter at all. You cannot know the whole; and without the whole you cannot understand a part. It is a history impossible for one side to tell with fairness to the other."

"There are still two sides, then? I had supposed from present appearances that you were both on the one side."

"Come, get along wi' ye! Ye deave me wi' your clatter," Dunsmuir evaded. But his playfulness sat grievously on him, and it jarred upon his child.

"You may joke and put me off, but it's a thing that cries for explanation."

"I am not a man who explains. Go ask Philip Norrison to expound his father to you. I should be blithe of the young man's interpretation."

"I ask you simply, What has he done? What have you—or had you—actually against him? And why do poor people speak of him in the same breath with their injuries, as if he were a public swindler?"

"Is that how the talk goes? Why, bless me, I supposed he was the man on horseback, the biggest frog in the puddle. So the people have memories, after all? It must be the sore-heads, then; the ones who got left. The peculiar disgrace in this country is to 'get left,' you'll observe; to grumble is next to it; the two go together, like cowardice and lying."

"Are we soreheads, then? Is that why we have grumbled?"

"You have a shrewd Scots tongue, young woman," said Dunsmuir, with a bitter chuckle. "It is well seen we have had catechists in the family."

"This may amuse you," Dolly answered, and her lip trembled. "It reminds me that once you would not have put me off so, when I had far less reason for asking to be satisfied."

Dunsmuir considered her flushed, excited face, and answered soberly: "Dolly, the trouble between Price Norrison and your father was never a personal quarrel, understand; it was a difference in our methods of working. He is a promoter, one who peddles schemes in the money-markets; he neither builds out of his head nor pays out of his pocket; he is the man who talks. And I am the man who builds, wisely or fondly as the case may be. It is well known we engineers have a great conceit of our own ideas. But my plan was no more to Norrison than any other man's; its merit to him was its price. He was jealous of the time spent pothering with a slow project, while he might have been reaping commissions from several. So he patched up a scheme of his own, which he privately substituted. To do him justice, he offered me half; but I could not look at it, from the nature of it, which was rotten, and he was tired of what he called my overniceness; and that was the break between us. I dare say I may have been invidious; I was angry. And he might have been more open with me. He might have waited to be off with one deal before he was on with another. He might afterward have been either for me or against me, and not have kept a vengeful interest in my scheme, which he used to strangle whenever it showed signs of life. Still, that is 'business,' according to the business man's code.

If I could have had a partner as sagacious and plucky as Norrison, with a better sense of faith and a larger grasp of the scheme, we had not waited so long, perhaps. Yet it has not been long. Land-builders must be content to work as nature works. But he had never a conception of the thing in hand; he does not love the making of a country; he wants the price of his dicker, and so away to the next one. The present combination, if you insist on knowing, was forced upon me. It's a union like that between the Scots and the English—neither was happy in it nor very proud of it; yet both lived, as we shall, to reap its benefits and to forget its humiliations."

"It is an ill-omened comparison. Our ditch-union, I hope, is not a sale," said Dolly, deeply moved. "And does the sun shine, now, on you both? Do you remember how you said you would never forgive him till he stood out of your sunlight?"

"A poor, silly speech. You would credit me more by forgetting it. Men make such speeches to their women, who are indulgent to a phrase. The sun is for him that can make hay while it shines. That is what Norrison did, in fine, when he built his ditch."

"Are you now the apologist, papa, or the historian?"

"Are you ever going to get over that ill-bred habit of retort? It is intolerable in a woman. You and Alan have argle-bargled till you know no other way of speaking. I have answered your first question. Now what else have you heard, between kitchen and parlor? What are the people's injuries?"

"I should like to know the whole story of Norrison's ditch."

"Would you, indeed? and do you think your father is the man to tell it? Would you take for gospel Norrison's story of my ditch?"

"I will make allowance; but I would have it from you. I ask you not to spare whatever to you is the truth."

"Poor Norrison! If he only knew that the girls are after his record, I don't quite perceive the grounds of my daughter's interest."

"I should think you might. He has stood for the enemy of my house these years and years; now he stands for the friend. I am all turned about, and I'm tired of being put off with phrases."

Dunsmuir laughed at her sharpness, but still with that bitter levity which took away her confidence in his answers. Dolly saw he was talking speciously, but could imagine no reason for his want of frankness.

"Well, then," he began, "Norrison built a ditch seventy miles long in something less than a hundred days. He boomed up the lands, and the settlers rushed in; and as most of them were

short of cash, Norrisson's company forms another company—two names, but one pocket. The loan and mortgage company advanced money to the settlers on their lands, and the water company sold them water. But the ditch was got together in such a hurry-scurry that it took a year or two to settle down to regular work; the water was here and there and everywhere but where it was wanted. The first crops went under, and the first crop of settlers went along with them. There was a terrible tumble in real estate; claims were jumped; there were foreclosures, contests, and scandals, and the deuce to pay generally. And when the pie was smashed, Norrisson and his crowd gathered and picked out the plums. After that it was well seen they could afford to patch up the leaks in their ditches. There was never a wilder water-system on the face of this earth, yet somehow they have scrambled through. I understand the farmers are making money now. I supposed the past was forgotten, except they used it as an election cry. What I have chiefly against Norrisson is not personal to the man. We are fearfully and wonderfully made; honesty is comparative, and the best of us cannot boast. It is the man's methods of business I object to. He has antagonized the farmers at the outset; he cinched them, there's not a doubt; and we are now to reap the fruits of the stone-age policy. It means a fight, and a great waste of the energies and the money of a new community. And when our big ditch is lined with ranches, and the farmers poll more votes than the company, they'll have to be bought, or they'll swing the elections and use their power as he has used his. It is all very corrupting, and a weariness to think on, when there's a

policy so much broader, which has been proved by the sad, wasteful experience of centuries. But it is written that young nations and young lives shall never profit by the mistakes of the old; every life and every country must learn its own lessons. But for an Old World looker-on, who has seen it all thrashed out before, it is a dowie business."

"Then you think Mr. Norrisson means to be honest, by his way of thinking?"

"I think he means to be a rich man."

"Have you ever seen the beautiful Mrs. Norrisson?"

"No; she has never shown up in this part of the country. I hear she is disaffected toward her husband and her native land, but she accepts her living from both; a lady with a small fist that can hold a heap of money. And there, you see, is where it befits to be charitable to the husband who has that hand to fill. Small blame to him if—"

"Oh, I've heard enough!" the girl broke in with a passionate gesture. "And where do you suppose the son comes from? His honesty is comparative too, I suppose?"

"He is a canny chiel," Dunsmuir answered coldly.

He watched Philip jealously in these days of his probation; took note of his prudent silence on a situation both had agreed was impossible—to any but a venal chief attainable through the loaves and fishes. Assuredly the young man had powers of self-control. Dunsmuir watched him come and go, faithful to the work, yet uncommitted; eyed him as Saul eyed David, and loved him not, yet could find in him no cause of offense.

(To be concluded in the next number.)

Mary Hallock Foote.

## HERBERT MAPES.

(DROWNED AUGUST 23, 1891.)

LAST night, what kingdom on his brow!  
 What mellow music in his voice!  
 What strength to make the eye rejoice!  
 What life! what flush of youth! . . . and now!

O brow dethroned! O muffled bell  
 Of speech! O net too loosely wove!  
 O sunken freight of hope and love!  
 Come back till we have said farewell.

Robert Underwood Johnson.

## AN ELK-HUNT AT TWO-OCEAN PASS.

NE fall with my ranch-partner, Ferguson, I made an elk-hunt in northwestern Wyoming among the Shoshone Mountains, where they join the Hoodoo and Absoraka ranges. There is no more beautiful game-country in the United States. It is a park-land, where glades, meadows, and high mountain pastures break the evergreen forest: a forest which is open compared to the tangled density of the woodland farther north. It is a high, cold region of many lakes and clear, rushing streams. The steep mountains are generally of the rounded form so often seen in the ranges of the Cordilleras of the United States; but the Hoodoos, or Goblins, are carved in fantastic and extraordinary shapes; while the Tetons, a group of isolated rock peaks, show a striking boldness in their lofty outlines.

This was one of the pleasantest hunts I ever made. As always in the mountains, save where the country is so rough and so densely wooded that one must go afoot, we had a pack-train; and we took a more complete outfit than we had ever before taken on such a hunt, and so traveled in much comfort. Usually, when in the mountains, I have merely had one companion, or at most two, and two or three pack-ponies; each of us doing his share of the packing, cooking, fetching water, and pitching the small square of canvas which served as tent. In itself packing is both an art and a mystery, and a skilful professional packer, versed in the intricacies of the "diamond hitch," packs with a speed which no non-professional can hope to rival, and fixes the side packs and top packs with such scientific nicety, and adjusts the doubles and turns of the lash-ropes so accurately, that everything stays in place under any but the most adverse conditions. Of course, like most hunters, I myself can in case of need throw the diamond hitch, after a fashion, and pack on either the off or near side. Indeed, unless a man can pack, it is not possible to make a really hard hunt in the mountains, if alone, or with only a single companion. The mere fair-weather hunter, who trusts entirely to the exertions of others, and does nothing more than ride or walk about under favorable circumstances, and shoot at what somebody else shows him, is a hunter in name only. Whoever would really deserve the title must be able at a pinch to shift for himself, to grapple with the difficulties and hardships of

wilderness life unaided, and not only to hunt, but at times to travel for days, whether on foot or on horseback, alone. However, after one has passed one's novitiate, it is pleasant to be comfortable when the comfort does not interfere with the sport; and although a man sometimes likes to hunt alone, yet often it is well to be with some old mountain hunter, a master of woodcraft, who is a first-rate hand at finding game, creeping upon it, and tracking it when wounded. With such a companion one gets much more game, and learns many things by observation instead of by painful experience.

On this trip we had with us two hunters, Tazewell Woody and Elwood Hofer, a packer who acted as cook, and a boy to herd the horses. Of the latter there were twenty; six saddle-animals and fourteen for the packs, two or three being spare horses, to be used later in carrying the elk-antlers, sheep-horns, and other trophies. Like most hunters' pack-animals, they were either half broken, or else broken down; tough, unkempt, jaded-looking beasts of every color — sorrel, buckskin, pinto, white, bay, roan. After the day's work was over, they were turned loose to shift for themselves; and about once a week they strayed, and all hands had to spend the better part of the day hunting for them. The worst ones for straying, curiously enough, were three broken-down old "bear-baits," which went by themselves, as is generally the case with the cast-off horses of a herd. There were two sleeping-tents, another for the provisions, — in which we ate during bad weather, — and a canvas tepee, which was put up with lodge-poles, Indian fashion, like a wigwam. A tepee is more difficult to put up than an ordinary tent; but it is very convenient when there is rain or snow. A small fire kindled in the middle keeps it warm, the smoke escaping through the open top; that is, when it escapes at all. Strings are passed from one pole to another, on which to hang wet clothes and shoes, and the beds are made round the edges. As an offset to the warmth and shelter, the smoke often renders it impossible even to sit upright. We had a very good camp-kit, including plenty of cooking- and eating-utensils; and among our provisions were some canned goods and sweetmeats, to give a relish to our meals of meat and bread. We had fur coats and warm clothes, which are chiefly needed at night, and plenty of bedding, including water-proof canvas sheeting and two caribou-hide sleeping-bags, procured

from the survivors of a party of arctic explorers. Except on rainy days I used my buckskin hunting-shirt or tunic; in dry weather I deem it, because of its color, texture, and durability, the best possible garb for the still-hunter, especially in the woods.

Starting a day's journey south of Heart Lake, we traveled and hunted on the eastern edge of the great basin, wooded and mountainous, wherein rise the head waters of the mighty Snake River. There was not so much as a spotted line,—that series of blazes made with the ax, man's first highway through the hoary forest,—but this we did not mind, as for most of the distance we followed well-worn elk-trails. The train traveled in Indian file. At the head, to pick the path, rode tall, silent old Woody, a true type of the fast-vanishing race of game-hunters and Indian-fighters, a man who had been one of the California forty-niners, and who ever since had lived the restless, reckless life of the wilderness. Then came Ferguson and I; then the pack-animals, strung out in line; while from the rear rose the varied oaths of our three companions, whose miserable duty it was to urge forward the beasts of burden.

It is heart-breaking work to drive a pack-train through thick timber and over mountains, where there is either a dim trail or none. The animals have a perverse faculty for choosing the wrong turn at critical moments, and they are continually scraping under branches and squeezing between tree-trunks, to the jeopardy or destruction of their burdens. After having been laboriously driven up a very steep incline, at the cost of severe exertion both to them and to the men, the foolish creatures turn and run down to the bottom, so that all the work has to be done over again. Some travel too slow, others travel too fast; yet one cannot but admire the toughness of the animals, and the sure-footedness with which they pick their way along the sheer mountain-sides, or among boulders and over fallen logs.

As our way was so rough, we found that we had to halt at least once every hour to fix the packs. Moreover, we at the head of the column were continually being appealed to for help by the unfortunates in the rear. First it would be "that white-eyed cayuse; one side of its pack's down!" then we would be notified that the saddle-blanket of the "lop-eared Indian buckskin" had slipped back; then a shout "Look out for the Pinto!" would be followed by that pleasing beast's appearance, bucking and squealing, smashing dead timber, and scattering its load to the four winds. It was no easy task to get the horses across some of the boggy places without miring, or to force them through the denser portions of the forest, where there was much down timber. Riding with a pack-train,

day in and day out, becomes both monotonous and irritating, unless one is upheld by the hope of a game-country ahead, or by the delight of exploration of the unknown. Yet when buoyed by such a hope, there is pleasure in taking a train across so beautiful and wild a country as that which lay on the threshold of our hunting grounds in the Shoshones. We went over mountain passes, with ranges of scalped peaks on each hand; we skirted the edges of lovely lakes, and of streams with boulder-strewn beds; we plunged into depths of somber woodland, broken by wet prairies. It was a picturesque sight to see the loaded pack-train stringing across one of these high mountain meadows, the motley-colored line of ponies winding round the marshy spots through the bright green grass, while beyond rose the dark line of frowning forest, with lofty peaks towering in the background. Some of the meadows were beautiful with many flowers—goldenrod, purple aster, bluebells, white immortelles, and here and there masses of blood-red Indian pinks. In the park-country, on the edges of the evergreen forest, were groves of delicate quaking-aspens, the trees often growing to a considerable height; their tremulous leaves were already changing to bright green and yellow, occasionally with a reddish blush. In the Rocky Mountains the aspens are almost the only deciduous trees, their foliage offering a pleasant relief to the eye after the monotony of the unending pine and spruce woods, which afford so striking a contrast to the hard-wood forest east of the Mississippi.

For two days our journey was uneventful, save that we came on the camp of a squawman, one Beaver Dick, an old mountain hunter, living in a skin tepee, where dwelt his comely Indian wife and half-breed children. He had quite a herd of horses, many of them mares and colts; they had evidently been well treated, and came up to us fearlessly.

The morning of the third day of our journey was gray and lowering. Gusts of rain blew in my face as I rode at the head of the train. It still lacked an hour of noon, as we were plodding up a valley, beside a rapid brook running through narrow willow-flats, with the dark forest crowding down on each hand from the low foot-hills of the mountains. Suddenly the call of a bull elk came echoing down through the wet woodland on our right, beyond the brook, seemingly less than half a mile off, and was answered by a faint, far-off call from a rival on the mountain beyond. Instantly halting the train, Woody and I slipped off, our horses, crossed the brook, and started to still-hunt the first bull.

In this place the forest was composed of the western tamarack; the large, tall trees stood well apart, and there was much down timber,

but the ground was covered with deep, wet moss, over which we trod silently. The elk was traveling up-wind, but slowly, stopping continually to paw the ground and to thrash the bushes with his antlers. He was very noisy, challenging every minute or two, being doubtless much excited by the neighborhood of his rival on the mountain. We followed, Woody leading, guided by the incessant calling.

It was very exciting as we crept toward the great bull, and the challenge sounded nearer and nearer. While we were still at some distance the pealing notes were like those of a bugle, delivered in two bars, first rising, then abruptly falling; as we drew nearer they took on a harsh, squealing sound. Each call made our veins thrill; it sounded like the cry of some huge beast of prey. At last we heard the roar of the challenge not eighty yards off. Stealing forward three or four rods, I saw the tips of the horns through a mass of dead timber and young growth, and slipped to one side to get a clean shot. Seeing us, but not making out what we were, and full of fierce and insolent excitement, the wapiti bull stepped boldly toward us with a stately, swinging gait. Then he stood motionless, facing us, barely fifty yards away, his handsome twelve-tined antlers tossed aloft, as he held his head with the lordly grace of his kind. I fired into his chest, and as he turned I raced forward and shot him in the flank; but the second bullet was not needed, for the first wound was mortal, and he fell before going fifty yards.

The dead elk lay among the young evergreens. The huge, shapely body was set on legs that were as strong as steel rods, and yet slender, clean, and smooth; they were in color a beautiful dark brown, contrasting well with the yellowish of the body. The neck and throat were garnished with a mane of long hair; the symmetry of the great horns set off the fine, delicate lines of the noble head. He had been wallowing, as elk are fond of doing, and the dried mud clung in patches to his flank; a stab in the haunch showed that he had been overcome in battle by some master bull, who had turned him out of the herd.

We cut off the head, and bore it down to the train. The horses crowded together, snorting, with their ears pricked forward, as they smelled the blood. We also took the loins with us, as we were out of meat, though bull elk in the rutting season is not very good. The rain had changed to a steady downpour when we again got under way. Two or three miles further we pitched camp in a clump of pines on a hillock in the bottom of the valley, starting hot fires of pitchy stumps before the tents, to dry our wet things.

Next day opened with fog and cold rain. The

drenched pack-animals, when driven into camp, stood mopingly, with drooping heads and arched backs; they groaned and grunted as the loads were placed on their backs and the cinches tightened, the packers bracing one foot against the pack to get a purchase as they hauled in on the lash-rope. A stormy morning is a trial to temper: the packs are wet and heavy, and the cold makes the work even more than usually hard on the hands. By ten we broke camp. It needs between two and three hours to break camp and to get such a train properly packed; once started, our day's journey was from six to eight hours long, making no halt. We started up a steep, pine-clad mountain-side, broken by cliffs. My hunting-shoes, though comfortable, were old and thin, and let the water through like a sieve. On the top of the first plateau, where black-spruce groves were strewn across the grassy surface, we saw a band of elk, cows and calves, trotting off through the rain. Then we plunged down into a deep valley, and, crossing it, a hard climb took us to the top of a great bare table-land, bleak and wind-swept. We passed little alpine lakes, fringed with scattering dwarf evergreens. Snow lay in drifts on the north sides of the gullies; a cutting wind blew the icy rain in our faces. For two or three hours we traveled toward the farther edge of the table-land. In one place a spike-bull elk stood half a mile off in the open; he traveled to and fro, watching us.

As we neared the edge the storm lulled, and pale, watery sunshine gleamed through the rifts in the low-scudding clouds. At last our horses stood on the brink of a bold cliff. Deep down beneath our feet lay the wild and lonely valley of Two-Ocean Pass, walled in on each hand by rugged mountain-chains, their flanks scarred and gashed by precipice and chasm. Beyond, in a wilderness of jagged and barren peaks, stretched the Shoshones. At the middle point of the pass two streams welled down from each side. At first each flowed in but one bed, but soon divided into two; each of the twin branches then joined the like branch of the brook opposite, and swept one to the east and one to the west, on their long journey to the two great oceans. They ran as rapid brooks, through wet meadows and willow-flats, the eastern to the Yellowstone, the western to the Snake. The dark pine forests swept down from the flanks and lower ridges of the mountains to the edges of the marshy valley. Above them jutted gray rock peaks, snow-drifts lying in the rents that seamed their northern faces. Far below us, from a great basin at the foot of the cliff, filled with the pine forest, rose the musical challenge of a bull elk; and we saw a band of cows and calves looking like mice as they ran among the trees.

It was getting late, and after some search we failed to find any trail leading down; so at last we plunged over the brink at a venture. It was very rough scrambling, dropping from bench to bench, and in places it was not only difficult but dangerous for the loaded pack-animals. Here and there we were helped by well-beaten elk-trails, which we could follow for several hundred yards at a time. On one narrow pine-clad ledge we met a spike-bull face to face, and in scrambling down a very steep, bare, rock-strewn shoulder the loose stones started by the horses' hoofs, bounding in great leaps to the forest below, dislodged two cows.

As evening fell, we reached the bottom, and pitched camp in a beautiful point of open pine forest thrust out into the meadow. There we found good shelter and plenty of wood, water, and grass; we built a huge fire and put up our tents, scattering them in likely places among the pines, which grew far apart and without undergrowth. We dried our steaming clothes, and ate a hearty supper of elk-meat; then we turned into our beds, warm and dry, and slept soundly under the canvas, while all night long the storm roared without. Next morning it still stormed fitfully; the high peaks and ridges round about were all capped with snow. Woody and I started on foot for an all-day tramp; the amount of game seen the day before showed that we were in a good elk-country, where the elk had been so little disturbed that they were traveling, feeding, and whistling in daylight. For three hours we walked across the forest-clad spurs of the foot-hills. We roused a small band of elk in thick timber; but they rushed off before we saw them, with much smashing of dead branches. Then we climbed to the summit of the range. The wind was light and baffling; it blew from all points, veering every few minutes. There were occasional rain-squalls; our feet and legs were well soaked; and we became chilled through whenever we sat down to listen. We caught a glimpse of a big bull feeding up-hill, and followed him; it needed smart running to overtake him, for an elk, even while feeding, has a ground-covering gait. Finally we got within a hundred and twenty-five yards, but in very thick timber, and all I could see plainly was the hip and the after part of the flank. I waited for a chance at the shoulder, but the bull got my wind and was off before I could pull trigger. It was just one of those occasions when there are two courses to pursue, neither very good, and when one is apt to regret whichever decision is made.

At noon we came to the edge of a deep and wide gorge, and sat down shivering to await what might turn up, our fingers numb, and our wet feet icy. Suddenly the love-challenge of an elk came pealing across the gorge, through the fine, cold rain, from the heart of the forest

opposite. An hour's stiff climb, down and up, brought us nearly to him; but the wind forced us to advance from below through a series of open glades. He was lying on a point of the cliff-shoulder, surrounded by his cows; and he saw us, and made off. An hour afterward, as we were trudging up a steep hillside dotted with groves of fir and spruce, a young bull of ten points, roused from his day-bed by our approach, galloped across us some sixty yards off. We were in need of better venison than can be furnished by an old rutting bull, so I instantly took a shot at the fat and tender young ten-pointer. I aimed well ahead, and pulled trigger just as he came to a small gully, and he fell into it in a heap with a resounding crash. On the way back that afternoon I shot off the heads of two blue grouse, as they perched in the pines.

That evening the storm broke, and the weather became clear and very cold, so that the snow made the frosty mountains gleam like silver. The moon was full, and in the flood of light the wild scenery round our camp was very beautiful. As always where we camped for several days, we had fixed long tables and settles, and were most comfortable; and when we came in at nightfall, or sometimes long afterward, cold, tired, and hungry, it was sheer physical delight to get warm before the roaring fire of pitchy stumps, and then to feast ravenously on bread and beans, on stewed or roasted elk venison, on grouse, and sometimes trout, and flapjacks with maple syrup.

Next morning dawned clear and cold, the sky a glorious blue. Woody and I started to hunt over the great table-land, and led our stout horses up the mountain-side by elk-trails so bad that they had to climb like goats. All these elk-trails have one striking peculiarity: they lead through thick timber, but every now and then send off short, well-worn branches to some cliff-edge or jutting crag, commanding a view far and wide over the country beneath. Elk love to stand on these lookout points, and scan the valleys and mountains round about.

Blue grouse rose from beside our path; Clarke's crows flew past us, with a hollow, flapping sound, or lighted in the pine-tops, calling and flirting their tails; the gray-clad whisky-jacks, with multitudinous cries, hopped and fluttered near us. Snow-shoe rabbits scuttled away, the great furry feet which give them their name already turning white. At last we came out on the great plateau, seamed with deep, narrow ravines. Reaches of pasture alternated with groves and open forests of varying size. Almost immediately we heard the bugle of a bull elk, and saw a big band of cows and calves on the other side of a valley. There were three bulls with them, one very large, and we tried to creep up on them; but the wind was baff-

fling, and spoiled our stalk. So we returned to our horses, mounted them, and rode a mile farther, toward a large open wood on a hillside. When within two hundred yards we heard directly ahead the bugle of a bull, and pulled up short. In a moment I saw him walking through an open glade; he had not seen us. The slight breeze brought us his scent. Elk have a strong characteristic smell; it is usually sweet, like that of a herd of Alderney cows, but in old bulls, while rutting, it is rank, pungent, and lasting. We stood motionless till the bull was out of sight, then stole to the wood, tied our horses, and trotted after him. He was traveling fast, occasionally calling, whereupon others in the neighborhood would answer. Evidently he had been driven out of some herd by the master bull.

He went faster than we did, and while we were vainly trying to overtake him we heard another very loud and sonorous challenge to our left. It came from a ridge-crest at the edge of the woods, among some scattered clumps of the northern nut-pine, or piñon, a queer conifer, growing very high on the mountains, its multiforked trunk and wide-spreading branches giving it the rounded top and, at a distance, the general look of an oak rather than a pine. We at once walked toward the ridge, up-wind. In a minute or two, to our chagrin, we stumbled on an outlying spike-bull, evidently kept on the outskirts of the herd by the master bull. I thought it would alarm all the rest; but, as we stood motionless, it could not see clearly what we were. It stood, ran, stood again, gazed at us, and trotted slowly off. We hurried forward as fast as we dared, and with too little care, for we suddenly came in view of two cows. As they raised their heads to look, Woody squatted down where he was, to keep their attention fixed, while I cautiously tried to slip off to one side unobserved. Favored by the neutral tint of my buckskin hunting-shirt, with which my shoes, leggings, and soft hat matched, I succeeded. As soon as I was out of sight, I ran hard and came up to a hillock crested with piñons, behind which I judged I should find the herd. As I approached the crest, their strong, sweet smell smote my nostrils. In another moment I saw the tips of a pair of mighty antlers, and I peered over the crest with my rifle at the ready. Thirty yards off, behind a clump of piñons, stood a huge bull, his head thrown back as he rubbed his shoulders with his horns. There were several cows around him, and one saw me immediately, and took alarm. I fired into the bull's shoulder, inflicting a mortal wound; but he went off, and I raced after him at top speed, firing twice into his flank; then he stopped, very sick, and I broke his neck with a fourth bullet. An elk

often hesitates in the first moments of surprise and fright, and does not get really under way for two or three hundred yards; but when once fairly started, he may go several miles, even though mortally wounded; therefore, the hunter, after his first shot, should run forward as fast as he can, and shoot again and again until the quarry drops. In this way many animals that would otherwise be lost are obtained, especially by the man who has a repeating-rifle. Nevertheless the hunter should beware of being led astray by the ease with which he can fire half a dozen shots from his repeater; and he should aim as carefully with each shot as if it were his last. No possible rapidity of fire can atone for habitual carelessness of aim with the first shot.

The elk I thus slew was a giant. His body was the size of a steer's, and his antlers, though not unusually long, were very massive and heavy. He lay in a glade, on the edge of a great cliff. Standing on its brink, we overlooked a most beautiful country, the home of all homes for the elk: a wilderness of mountains, the immense evergreen forest broken by park and glade, by meadow and pasture, by bare hillside and barren table-land. Some five miles off lay the sheet of water known to the old hunters as Spotted Lake; two or three shallow, sedgy places, and spots of geyser formation made pale green blotches on its wind-rippled surface. Far to the southwest, in daring beauty and majesty, the grand domes and lofty spires of the Tetons shot into the blue sky. Too sheer for the snow to rest on their sides, it yet filled the rents in their rough flanks, and lay deep between the towering pinnacles of dark rock.

That night, as on more than one night afterward, a bull elk came down whistling to within two or three hundred yards of the tents, and tried to join the horse herd. The moon had set, so I could not go after it. Elk are very restless and active throughout the night in the rutting season; but where undisturbed they feed freely in the daytime, resting for two or three hours about noon.

Next day, which was rainy, we spent in getting in the antlers and meat of the two dead elk, and I shot off the heads of two or three blue grouse on the way home. The following day I killed another bull elk, following him by the strong, not unpleasing, smell, and hitting him twice as he ran, at about eighty yards. So far I had had good luck, killing everything I had shot at; but now the luck changed, through no fault of mine, as far as I could see, and Ferguson had his innings. The day after I killed this bull he shot two fine mountain rams, and during the remainder of our hunt he killed five elk — one cow, for meat, and four good bulls. The two rams were with three others, all old and with fine horns; Ferguson peeped over a lofty precipice and saw them coming up it only

fifty yards below him. His two first and finest bulls were obtained by hard running and good shooting; the herds were on the move at the time, and only his speed of foot and soundness of wind enabled him to get near enough for a shot. One herd started before he got close, and he killed the master bull by a shot right through the heart, as it trotted past, a hundred and fifty yards distant.

As for me, during the next ten days I killed nothing save one cow for meat, and this though I hunted hard every day from morning till night, no matter what the weather. It was stormy, with hail and snow almost every day; and after working hard from dawn until nightfall, laboriously climbing the slippery mountain-sides, walking through the wet woods, and struggling across the bare plateaus and cliff-shoulders, while the violent blasts of wind drove the frozen rain in our faces, we would come in after dusk wet through and chilled to the marrow. Even when it rained in the valleys it snowed on the mountain-tops, and there was no use trying to keep our feet dry. I got three shots at bull elk, two being very hurried snap-shots at animals running in thick timber, the other a running-shot in the open, at over two hundred yards; and I missed all three. On most days I saw no bull worth shooting; the two or three I did see or hear we failed to stalk, the light, shifty wind baffling us, or else an outlying cow which we had not seen giving the alarm. There were many blue, and a few ruffed, grouse in the woods, and I occasionally shot off the heads of a couple on my way homeward in the evening. In racing after one elk, I leaped across a gully and so bruised and twisted my heel on a rock that, for the remainder of my stay in the mountains, I had to walk on the fore part of that foot. This did not interfere much with my walking, however, in going down-hill.

Our ill success was in part due to sheer bad luck; but the chief element therein was the presence of a great hunting-party of Shoshone Indians. Split into bands of eight or ten each, they scoured the whole country on their tough, sure-footed ponies. They always hunted on horseback, and followed the elk at full speed wherever they went. Their method of hunting was to organize great drives, the riders strung in lines far apart; they signaled to one another by means of willow whistles, with which they also imitated the calling of the bull elk, thus tolling the animals to them, or making them betray their whereabouts. As they slew whatever they could, but by preference cows and calves, and as they were very persevering, but also very excitable and generally poor shots, so that they wasted much powder, they not only wrought havoc among the elk, but also scared the survivors out of all the country over which they hunted.

Day in and day out we plodded on. In a hunting-trip the days of long monotony in getting to the ground, and the days of unrequited toil after it has been reached, always far outnumber the red-letter days of success. But it is just these times of failure that really test the hunter. In the long run, common sense and dogged perseverance avail him more than any other qualities. The man who does not give up, but hunts steadily and resolutely through the spells of bad luck until the luck turns, is the man who wins success in the end.

After a week at Two-Ocean Pass,<sup>1</sup> we gathered our pack-animals one frosty morning, and again set off across the mountains. A two-days' jaunt took us to the summit of Wolverine Pass, near Piñon Peak, beside a little mountain tarn; each morning we found its surface skimmed with black ice, for the nights were cold. After three or four days, we shifted camp to the mouth of Wolverine Creek, to get off the hunting-grounds of the Indians. We had used up our last elk-meat that morning, and when we were within a couple of hours' journey of our intended halting-place, Woody and I struck off on foot for a hunt. Just before sunset we came on three or four elk. A spike-bull stood for a moment behind some thick evergreens a hundred yards off; guessing at his shoulder, I fired, and he fell dead after running a few rods. I had broken the luck after ten days of ill success.

Next morning Woody and I, with the packer, rode to where this elk lay. We loaded the meat on a pack-horse, and let the packer take both the loaded animal and our own saddle-horses back to camp, while we made a hunt on foot. We went up the steep, forest-clad mountain-side, and before we had walked an hour heard two elk whistling ahead of us. The woods were open, and quite free from undergrowth, and we were able to advance noiselessly; there was no wind, for the weather was still, clear, and cold. Both of the elk were evidently very much excited, answering each other continually; they had probably been master bulls, but had become so exhausted that their rivals had driven them from the herds, forcing them to remain in seclusion until they regained their lost strength. As we crept stealthily forward, the calling grew louder and louder, until we could hear the grunting sounds with which the challenge of the nearest ended. He was in a large wallow, which was also a lick. When we were still sixty yards off, he heard us, and rushed out, but wheeled and stood a moment to gaze, puzzled by my buckskin suit. I fired into his throat, breaking his neck, and down he went in a heap. Rushing in and turning, I called to Woody, "He's a twelve-pointer, but

<sup>1</sup> Since this was written Two-Ocean Pass has been included in the National Forest Reserve.

the horns are small." As I spoke I heard the roar of the challenge of the other bull not two hundred yards ahead, as if in defiant answer to my shot.

Running quietly forward, I speedily caught a glimpse of his body. He was behind some fir-trees about seventy yards off, and I could not see which way he was standing, and so fired into the patch of flank which was visible, aiming high, to break the back. My aim was true, and the huge beast crashed down-hill through the evergreens, pulling himself on his fore legs for fifteen or twenty rods, his hind quarters trailing. Racing forward, I broke his neck. His antlers were the finest I ever got. A couple of whisky-jacks appeared at the first crack of the rifle, with their customary astonishing familiarity and heedlessness of the hunter; they followed the wounded bull as he dragged his great carcass down the hill, and pounced with ghoulis bloodthirstiness on the clots of blood that were sprinkled over the green herbage.

These two bulls lay only a couple of hundred yards apart, on a broad game-trail, which was as well beaten as a good bridle-path. We began to skin out the heads; and as we were finishing we heard another bull challenging far up the mountain. He came nearer and nearer, and as soon as we had ended our work we grasped our rifles and trotted toward him along the game-trail. He was very noisy, uttering his loud, singing challenge every minute or two. The trail was so broad and firm that we walked in perfect silence. After going only five or six hundred yards, we got very close indeed, and stole forward on tiptoe, listening to the roaring music. The sound came from a steep, narrow ravine to one side of the trail, and I walked toward it with my rifle at the ready. A slight puff gave the elk my wind, and he dashed out of the ravine like a deer; but he was only thirty yards off, and my bullet went into his shoulder as he passed behind a clump of young spruce. I plunged into the ravine, scrambled out of it, and raced after him. In a minute I saw him standing with drooping head, and two more shots finished him. He also bore fine antlers. It was a great piece of luck to get three such fine bulls at the cost of half a day's light work; but we had fairly earned them, having worked hard for ten days, through rain, cold, hunger, and fatigue, to no purpose. That evening my home-coming to camp, with three elk-tongues and a brace of ruffed grouse hung at my belt, was most happy.

Next day it snowed, but we brought a pack-pony to where the three great bulls lay, and took their heads to camp; the flesh was far too strong to be worth taking, for it was just at the height of the rut.

This was the end of my hunt, and a day later Hofer and I, with two pack-ponies, made a rapid push for the Upper Geyser Basin. We traveled fast. The first day was gray and overcast, a cold wind blowing strong in our faces. Toward evening we came on a bull elk in a willow thicket; he was on his knees in a hollow, thrashing and beating the willows with his antlers. At dusk we halted and went into camp by some small pools on the summit of the pass north of Red Mountain. The elk were calling all around us. We pitched our cozy tent, dragged great stumps for the fire, cut evergreen boughs for our beds, watered the horses, tethered them to improvised picket-pins in a grassy glade, and then set about getting supper ready. The wind had gone down, and snow was falling thickly in large, soft flakes; we were evidently at the beginning of a heavy snow-storm. All night we slept soundly in our snug tent. When we arose at dawn there was a foot and a half of snow on the ground, and the flakes were falling as fast as ever. There is no more tedious work than striking camp in bad weather, and it was over two hours from the time we rose to the time we started. It is sheer misery to untangle picket-lines and to pack animals when the ropes are frozen, and by the time we had loaded the two shivering, wincing pack-ponies, and had bridled and saddled our own riding-animals, our hands and feet were numb and stiff with cold, though we were really hampered by our warm clothing. My horse was a wild, nervous roan, and as I swung carelessly into the saddle, he suddenly began to buck before I got my right leg over, and threw me off. My thumb was put out of joint. I pulled it in again, and speedily caught my horse in the dead timber. Then I treated him as what the cow-boys call a "mean horse," and mounted him carefully, so as not to let him either buck or go over backward. However, his preliminary success had inspirited him, and a dozen times that day he began to buck, usually choosing a down grade, where the snow was deep and there was much fallen timber.

All day long we pushed steadily through the cold, blinding snow-storm. Neither squirrels nor rabbits were abroad, and a few Clarke's crows, whisky-jacks, and chickadees were the only living things we saw. At nightfall, chilled through, we reached the Upper Geyser Basin. Here I met a party of railroad surveyors and engineers coming in from their summer's field-work. One of them lent me a saddle-horse and a pack-pony, and we went on together, breaking our way through the snow-choked roads to the Mammoth Hot Springs, while Hofer took my own horses back to Ferguson.

## ARCHITECTURE AT THE WORLD'S COLUMBIAN EXPOSITION.—IV.

THE site of the Transportation Department lies next west of the Mines and Mining Building, and in necessary and convenient proximity to the railroads. In this case the specific character of the exhibit must dictate even more absolutely the practical plan of the structure which is to accommodate it. A very large and characteristic part of this exhibit must be locomotive engines, and other specimens of railroad rolling-stock. In laying out a system of installation for these, it was found more convenient to arrange the rails at right angles to the length of the building, and to space them 16 feet on centers, in order to allow sufficient room for circulation between them. Two pairs of rails, so spaced, to each bay gave a width of 32 feet, which thus became the constant module of dimension and the common divisor of the plan; indeed, this factor proved the basis of the whole architectural scheme. If it had been a few feet more or less, we should have had a different building. In fact, as is apparent in the analyses of all these designs, the unit of dimension must exercise an influence over architectural compositions analogous to that of the various terms of *tempo*, from *largo* or *adagio* to *allegro*, in their relation to music. The area at the disposal of the architects, Messrs. Adler & Sullivan of Chicago, permitted this divisor to enter thirty times into the length and eight times into the width of their building, which thus became 960 feet long by 256 feet wide, with a triangular area lying westward between the building and the park boundaries, whereon could be located all such annex buildings as might be required to accommodate the rougher rolling-stock, and such other exhibits as could not find place in the main building.

In studying the roofing and lighting of this space, it was found convenient to set aside three of these modules or divisors for the width of a

lofty longitudinal central nave, which should be open to its whole height to accommodate those exhibits requiring considerable vertical space (such as aerial devices and elevators); and two modules and a half on each side for two-storied aisles, where road vehicles, and all other means of light transportation by land or water, could be arranged and classified. Each aisle, as well as the nave, is furnished with double pitched roofs and skylights, and the nave is carried high enough to permit the introduction of two ranges of clearstory windows, of which the lower are circular. It was the purpose of the architects to treat this double clearstory with decorative detail; but considerations of economy have deprived us of much of this interesting interior effect. Studies, however, have been made for the occupation of the triforium wall-space beneath these windows by a broad painted frieze, extending quite around the nave, and setting forth poetically the history of transportation from archaic to modern times. For reasons which will presently appear, it was consistent with their scheme to finish these roofs at the ends with hips, and not with gables.

In considering, in outline, how these great buildings have assumed definite architectural shape, we have been anxious to show that they have grown from practical conditions by logical or reasonable processes, and are not the result of mere personal idiosyncrasies, imposing upon the work favorite formulas of design, which have no essential relations to these conditions. Nevertheless, these buildings, being, in their principles of growth, problems of art and not of mathematics or mere engineering, each has been capable of many widely differing artistic solutions, through equally rational processes, from that which it has actually received, just as the same idea would necessarily be expressed by half a dozen masters of literature in half a dozen different ways, or as the same theme would be treated by several musical composers in several harmonic ways, according to the personal equation or the accident of mood of the master

in each case. The architect uses his conventional historic forms as the poet uses his conventional historic words; both forms and words have come down to us, modified and enriched by the generations of mankind through which they have passed, and for this reason there is often a deeper significance in them than is patent to the multitude. Architectural formulas, in their various developments through centuries of usage, have become symbols of the genius of nations; no architect can adapt them intelligently and successfully to his work unless his mind has been saturated with these inner meanings, and unless he has learned to respect the language which he uses. The harmonious combination which he may be able to make of these

forms, and his applications of them to his composition, may be simply correct, because free from errors of architectural grammar or rhetoric; or they may be brilliant, because they are also original without caprice; surprising without evidence of effort; poetic, because of his inner light. The degrees of success range from correctness to brilliancy, and the varieties are infinite.

Now the work of Adler & Sullivan in this Transportation Building is widely different from that which they would have produced had they been placed under those restrictions which, for the reasons stated, were voluntarily and properly assumed by the architects of the Court. The former were free to use any language of form fitted to express the purposes of their building, and they were under no other limitations than those furnished by minds educated and trained in art. In endeavoring to show, therefore, how their work took shape, we shall, in this as in other cases,—carefully avoiding the attitude of criticism, which would be premature and improper,—proceed not as if the methods of development were exact and positive in a scientific sense, and recognizing that there cannot be any single, final, and only possible solution to a problem of art. No true artist ever wrote Q. E. D. under his project.

The general plan and method of accommodation being accepted, we are now in position to see how they will affect the architectural expression of the interior. We imagine the architects reasoning as follows:

It is our purpose to confer upon an object of utility an expression of fitness and beauty—to utter truth, not only with correctness, but with the grace of poetic diction. In the first place, therefore, let us inclose the structure which we have developed with a wall having merely functions of usefulness. In piercing this wall for the necessary windows, let us make one large opening to correspond with each of the 32-foot bays established by our module of dimension; but let us not make these openings so wide as to narrow the piers between them and thus to convert what we intend to be a wall into a colonnade or arcade. Let us preserve the idea of a wall-surface by keeping our piers wide, and by finishing our openings with arches so that the spandrel surfaces between may be added to the area of repose. But in making the window-openings high enough for the practical purpose of lighting the interior, we have left only a narrow and weak wall-surface over them. In order to remedy this defect, and to bring our wall to a height which will not be low when compared with that of our neighbors, we venture to build it 10 feet higher than is constructionally necessary, so that it shall reach a total height of 53 feet, thus forming a screen to mask the aisle-roofs behind. Now,

for the necessary protection and shadow to the plain surface of our wall, let us place upon it a boldly overhanging coping. To give dignity and apparent stability to the closure which we are considering, we then find it necessary to make our wall thick and massive, and these qualities must be illustrated in the treatment of the jambs of our openings. If the jambs are cut through at right angles, we shall make an inadequate and ineffective use of this quality of thickness or massiveness of wall; on the other hand, we shall increase the apparent depth of wall, and draw attention to it, by splaying the jambs with a series of right-angled returns, thus engendering in each opening a nest of diminishing arches, and, as it were, easing off the wall-surface at these points, as was done by the Romanesque and Gothic builders. We have already arranged that our long front shall be thirty bays long, and our end fronts eight bays long. But one of these bays must occur in the center of each front for the sake of the entrances; this will leave a half-bay at the corners. The result of this is that we have a wider pier at the ends, and by this simple device give a natural pause to the succession of arches on each front at the corners, without resorting for this purpose to the conventional end-pavilions, for which our plan does not offer sufficient excuse.

But the frontage which our wall-surface has thus developed, though entirely reasonable, is low, monotonous, and mechanical in its effect. The first difficulty, in its relation to the architectural composition as a whole, we may readily remedy by exaggerating the height of our central nave, so that, from ordinary points of view, it shall be seen to disengage itself well from the ridges of the aisle-roofs which encompass it, and thus form a part of the exterior architecture. To each bay of the upper part of the clearstory, thus elevated, we give two arches, corresponding in character to the single arch in the façade, though properly smaller in scale, and, by the same reasoning, we find it essential to raise these clearstory walls higher than the eaves of the nave-roof, and to crown them with a second overhanging coping.

We have thus designed a series of wall-surfaces in what seems to us a perfectly logical manner, but, as yet, with no projections whatever to break their monotony,—no pilasters, no string-courses, no base, no moldings of any sort, and no cornice, in the usual sense,—only a blank flat wall, pierced with deep arched openings, and protected by a boldly overhanging coping, square and uncompromising.

Now shall we make a concession to convention, and attempt to illustrate structure and use symbolically by applying projecting architectural features to our flat wall-surfaces after

academical fashion and according to Renaissance motives, thereby saying what we have to say in diplomatic language, as it were, using forms which have obtained dignity and significance because of their association with the history of civilization, of which, indeed, they are a part; or rather shall we make this flat wall-surface itself the basis of expression, avoiding words and phrases of Latin origin, and, as was done by the Saracens in the Alhambra, who worked, as we are now working, in a plastic substance, which invited molding beneath the surface rather than carving above the surface—shall we decorate these flat surfaces with repeating superficial patterns? By the latter process we may, where we require, make our planes of construction beautiful without losing

any of the advantages of simplicity and repose, which we are striving to secure by following rational methods. In treatments of this sort the example of Oriental nations is full of instruction, and we know the rich results obtained in this manner, not only by the Moors of Spain, but by Mohammedan art in the mosques at Cairo, and by Indian art in the tombs of Agra. We shall thus get architectural effects of light and shade, not by delicate playing with the complicated shadows and half-lights of pilasters, porticos, and molded entablatures, as in classic art, nor by the bolder *chiaroscuro* obtained by the buttresses, panels, and corbel-tables of medieval art, but by breaking the broadly staring sunlight on our smooth wall-surfaces with the broad black shadows of our coping, with the sharper and finer shade-lines obtained by recessing the window-reveals in a series of narrow planes, and with the regular spotted effects resulting from our spaces of superficial arabesque or fretwork. These wall-surfaces also invite a treatment by contrasts of color in masses or diapers, after the Oriental manner, thus giving opportunity for effects of festivity, which, however, need not derogate from the massiveness and breadth which seem most consistent with the fundamental character of our building.

It is a recognized principle of composition that a mass may be simplified, or even impoverished, for the sake of emphasizing by contrast a certain highly decorated point of interest. This principle seems especially applicable to our present case, because the purposes of our building do not call for an embellishment which would be appropriate in the zenana of an Indian palace, or in the tomb of an Oriental princess. The architectural virtue to be exercised in our case is self-denial rather than generosity. In the mass of our façades, therefore, we should use our facile means of decoration with great prudence, doing no more than may be necessary to make our wall respected as a work of art.

The west or rear side of our building will be completely occupied and masked by annexes; the north and south ends are so situated as

DRAWN BY A. BRENNAN.

BIT OF ORNAMENT, TRANSPORTATION BUILDING.

to make the necessary entrances at these points very subordinate: but the center of the east front, toward the Lagoon and opposite the west center of the Liberal Arts Building, must be the main portal of our design. This feature, therefore, may very properly constitute that point of architectural emphasis of which we have spoken, and to which the rest of this facade must be little more than a preparation or foil. The most majestic feature in the best art of the Mogul emperors, as in the closure of the great mosque at Delhi, or in the Taj-Mehal at Agra, is the porch. It is a flat, square-topped, projecting wall-face, pierced with a lofty pointed arch, forming the opening of

doorway. We may cover the entire superficial area of this pavilion with a delicate embroidery of arabesques and bas-reliefs — its fronts, its returns, its recessed archways, the wall-screen which closes the opening at the back, the face and soffit of its coping, its impost, and its stylobate. We will make the whole fretted mass splendid with gilding, so that this main entrance shall be known as the "Golden Doorway." The pavilion interrupts and discontinues every horizontal line in the edifice, so that we must depend upon a sparse echo of this embroidery on our long wall-faces to bring the composition together and to secure its unity of effect. We will therefore content ourselves

GENERAL VIEW OF HORTICULTURAL HALL.

a deep square niche, and profusely decorated with borders and spandrel panels of arabesque, and with inscriptions in inlay and superficial sculpture. It has no cornice, and frequently is finished with a parapet of lacework. Instructed by a study of these Oriental masterpieces, we may adjust them to our present use with but few modifications. The rigid, square, projecting mass, with its great arched opening, the profuse superficial decoration, and even the light characteristic kiosks or pagodas which accompanied the original, may all be reproduced here; but in order to amalgamate the whole with the work which we have already developed, it must finish with a similar bold overhanging brow, the arch must be low and round, that it may occupy a proportionate space in the face of our pavilion, and its opening must diminish inward in a succession of lessening arches in the Romanesque manner (Romanesque and Saracenic art having a common parentage at Byzantium), until the opening is reduced to dimensions practicable for a

with its use on the piers at the point where our arches spring, and on the under side of the coping. Practically the rest is left in repose to offset the splendor of the center. But in order to give a degree of movement to the hard square outlines of the pavilion, and to secure somewhat of a pyramidal effect, we support it on each side with terraces and balconies on a level with the impost of the arch, and accessible by outside stairs, and on each terrace we build a light kiosk against the pavilion in the manner of the Mogul architects. By this somewhat playful device we hope to secure for our building an aspect of festivity more appropriate to the place and occasion than would be obtained if we were content to leave its lines all severely adjusted to rational conditions of design. In like manner, and with the same object of conferring points of interest on the long plain line of frontage, we may venture to open four small exit doors, two on each side of the central portal, with decorated architraves, and flanked by pedestals against the adjoining piers

to support groups of typical statuary. The end entrances may be constructed with low, square-topped, projecting pavilions, highly enriched, and flanked by terraces and staircases as in the front. In the center of the nave provision is made for a competitive exhibition of transportation by elevators. These are arranged in a group around a cylindrical core, and give access, by bridges across the nave, to the second floor and to a great terrace over the central portal, and connect with observatory balconies which surround a central lantern. This is the culminating feature of the design; it is highly decorated, and completes the exterior.

We have already stated that the decoration concentrated at various points on the Trans-

in the history of the world—the new birth of the mind, the revival of learning, the reformation in religious, political, and social life, which made modern civilization possible. These conventionalities, based upon ancient example, and highly organized by the discipline of the schools, are the symbols of this civilization. Such work as we see in the architectural system of the building which we have just been studying in outline may, in comparison, be considered romantic or barbaric (using the term in no derogatory sense, but as defining a condition of design outside the pale of classic authority), a product hardly less of invention than of convention, developing from within outward, and taking forms less consciously affected by historical precedent.

This assumption of freedom in the hands of uneducated men becomes license and disorder; in the hands of men of training, but without principles, it becomes insubordination, and results in clever work of mere swagger and audacity, a manifestation of personal idiosyncrasy, more or less brilliant and amusing perhaps, but corrupting and unfruitful. With knowledge, but without genius or imagination, it becomes

DRAWN BY H. G. RIPLEY.

CENTRAL DOME AND PORCH OF HORTICULTURAL HALL.

portation Building is composed of arabesques. These are mostly foliations, more or less based upon regularly recurring geometrical systems, but following nature in varieties of form and principles of growth. At certain important points these arabesques are frames to figure-subjects in relief, illustrating in allegorical fashion the objects of the building. Properly to complement what we have here supposed the architects themselves might say regarding the genesis of this design, it seems desirable to add a few words of general statement and wider application.

The exact and scholarly conventionalities of the Court buildings recall the most brilliant era

merely archæological: but under favorable circumstances this romanticism may rise into a region of purity, sobriety, and elegance hardly inferior to that occupied for more than twenty centuries (allowing for the medieval interruption) by classic art. Into this region of difficult access the accomplished architects of the Transportation Building are seeking to enter with a fine, courageous spirit of duty, and the evidences of their work, not only on the Exhibition grounds, but more conspicuously in the Auditorium of Chicago, and elsewhere, are sufficient to indicate that somewhere perhaps in this dangerous field there may be a regeneration for the art of our time and country—not a re-

vival of forms, but an establishing of principles, instructed rather than controlled by a spirit out of the inexhaustible past.

It is eminently fitting that in this exposition of national thought in architecture, our characteristic spirit of eager inquiry, of independent and intelligent experiment, should have the fullest illustration. If our late studies in Byzantine Romanesque and Saracenic art may seem to the foreign critic merely empirical, we may be able to show that in some instances they have been carried far enough to exercise a fructifying influence in the development of style in this country, and to infuse new blood into an art which, in the hands of the graduates of our schools of design, may be in danger of becoming scholastic or exotic, and of developing forms far removed from the uses and sympathies of modern life. In fact, it is not from loyalty to ancient formulas of beauty, not from revivals or correct archæological repetitions, that the true regeneration of modern architecture must come, but from the application to modern necessities and modern structure of the principles which controlled the evolution of the pure historical styles.

MESSRS. W. L. B. Jenney & W. B. Mundie of Chicago, architects of the Horticultural Building, have been able to occupy the beautiful site at their disposal with a magnificent frontage of 1000 feet, facing the Lagoon, the ornamental gardens and parterres of the floral department

LORENZO TAFT, SCULPTOR.

SLEEP OF THE FLOWERS, HORTICULTURAL HALL.

stretching broadly between this long façade and the waterside. The extreme depth of their building-site is about 250 feet. It was evident to the architects that a building for the cultivation and exposition of growing plants must be based upon what has been found by experience to be the best form for a garden greenhouse or conservatory. The architecture of such a structure must therefore include, as a fundamental feature of design, a series of light one-storied galleries with glazed roofs, from 50 to 70 feet wide, so arranged upon the site as to

inclose garden courts, which would have all desirable sunlight, because practical conditions do not permit these surrounding galleries to exceed  $22\frac{1}{2}$  feet in height. As this height is only about one third that of the other buildings, and as it is necessary that the architectural mass must in some way be brought into proper relation to them, it became apparent to the architects that from the point of view of composition there should be pavilions at the north and south

possible from the main porch. A third pavilion was thus introduced in the center of the building. As a matter of convenience as well as of structure, the architects divided their galleries into bays of  $24\frac{1}{2}$  feet, which dimension they assumed as the module or unit of their plan. Thirty-one of these modules entered into the length of their building between the end pavilions, leaving for each of these pavilions a width of 118 feet. By experiment they found that the largest

WOMEN'S BUILDING.

ends, where they approach nearest to their neighbors, and where comparisons must be instinctively forced upon the beholder, and that these pavilions should hardly be less than 50 feet high. Of course this height suggested two stories, in which could be accommodated not only collections and models illustrative of botany and horticulture, but spacious and attractive restaurants overlooking the gardens. Upon the first story of  $21\frac{1}{2}$  feet, therefore, there is constructed in these pavilions another still higher. Thus we have an outline of a building composed of two-storied pavilions at each end of the site, connected by two long, low ranges of one-storied glazed galleries, with an open court between them. But for practical as well as for architectural reasons it is necessary to break this interminable stretch of low galleries with an important and highly decorated central feature. The architects had to accommodate under cover not growing shrubs only, but full tropical tree-growths with grotto effects and fountains. This suggested a much higher but still characteristic feature of greenhouse architecture—a glazed, wide-spreading dome, made as large as the available space would permit, but not so high as to overwhelm the one-storied galleries. This dome naturally took its place in the center, and, as it was to constitute the most imposing feature, interior as well as exterior, it had to be entered as directly as

possible from the main porch. A third pavilion was thus introduced in the center of the building. As a matter of convenience as well as of structure, the architects divided their galleries into bays of  $24\frac{1}{2}$  feet, which dimension they assumed as the module or unit of their plan. Thirty-one of these modules entered into the length of their building between the end pavilions, leaving for each of these pavilions a width of 118 feet. By experiment they found that the largest

dome which architectural considerations would permit must not exceed 180 feet in diameter. They placed, therefore, a glazed domical hall of these dimensions in the center of a two-storied substructure of square plan, of about nine modules, with a projecting frontispiece toward the Lagoon in three parts, of which the central is the portal, the others being crowned by low domes occupying the corners of the square and butressing the larger central dome. By a mutual adjustment of the parts thus outlined a definite architectural scheme was obtained, composed of two two-storied end pavilions, 118 feet wide and 250 feet deep, connected in the rear by a continuous one-storied glazed gallery, 50 feet wide and  $759\frac{1}{2}$  feet long, against the center of which was placed a great domical pavilion, about 220 feet square, faced with a highly enriched pylon. A second and more important longitudinal gallery, with glazed arched roofs, parallel with the first and 73 feet wide, forming the curtain-walls of the main façade, connected the center with the end pavilions, thus inclosing two garden-courts, 90 feet wide and 270 feet long.

As for the exterior, the architects are committed to a long, low façade, of which the curtain-walls are only  $22\frac{1}{2}$  feet high, crowned with a 3-foot balustrade. The expression of their central dome, therefore, must be correspondingly low in proportion to its height; considerations

of architectural conformity must be forced into harmony with considerations of practical convenience and use. The vertical section of this dome is accordingly made semicircular, and the center from which the semicircle is struck is on a level with the gallery or second story surrounding the dome, and thus only about 24 feet from the floor, giving a total height of only 114 feet to a dome 180 feet in diameter. So far as the interior is concerned, this proportion is admirable; but the depressed exterior effect of this great glazed dome is partly remedied by a drum or podium, which is established above the flat roof of the square substructure forming the base of the dome, and which is high enough to be seen from ordinary points of view, and also by a highly enriched crown or lantern which surmounts the dome itself. The lower glazed domes, which crowd against its base on the corners, effectually support its outlines, and assist them to spring from the façade with grace and elegance, and without too sudden transitions. The curved sky-lines are also aided by the segmental form of the glazed roofs of the galleries on each hand. The transparent character of this immense ball and the airy lightness of its structure remove it from comparison with the substantial fabrics of the domes that elsewhere in the fields of the Exposition rise with more monumental aspiration. It has a quality of fleeting and iridescent beauty, and seems to be blown like a bubble.

In their decorative scheme the architects preferred to follow Venetian Renaissance models, and they applied to the curtain-walls of their long front galleries a correct Ionic order with pilasters, dividing the frontage into bays corresponding to those of the interior, each being occupied by a glazed arched window, reducing the wall-surfaces to the smallest areas consistent with classic traditions, as in the orangeries of Versailles. This order is continued around the end pavilions; but as the architects were compelled to erect upon this a second story 3 feet higher than that upon which it was placed, to enable their building to compare properly with its neighbors in regard to height, they treated their upper order, which is also Ionic, with an exaggerated frieze 6 feet high, giving an area for decoration, which they richly filled with Cupids, garlands, and festoons, abundantly testifying to the joyous and gentle character of the objects to which the building is dedicated. In these pavilions they were wisely led by the example of Sansovino in the Library of St. Mark on the Piazzetta, Venice, and the arrangement also of crowning balustrades and finials, characteristic of this elegant monument, evidently had a strong influence on the present composition.

The portal is a lofty triumphal arch with a re-

cessed vestibule, decorated with statuary, and in the character of its profuse embellishments of sculpture recalling the work of modern Paris; but in the two square pavilions, crowned with their subordinate domes, flanking the portal, the Venetian motives are again taken up. The Ionic order again appears here, but is on a larger scale than that of the long curtain-walls, and its entablature has a frieze broader even than that of the corner pavilions, and it is enriched with the exuberant but elegant playfulness which the Italian masters knew so well how to employ in the service of their paganized princes.

Seen from whatever point of view, no one can doubt the purposes of this building, and though its architecture has been gaily attuned to a much lighter mood than would be proper to its more serious companions, it does not forget the dignity and grace which belong to it as a work of art.

The decorative modeling and sculpture of this building are the work of Mr. Loredo Taft of Chicago.

THE first point of interest connected with the Women's Pavilion resides in the fact that it is the product of a national competition of designs among women. An architectural composition, like any other work of art, is always more or less sensitive to the personal qualities of the designer. Consequently, in examining the works of the successful competitor in this case, there is an irresistible impulse to look for the distinctive characteristics in which the feminine instinct may have betrayed itself. Miss Sophia G. Hayden of Boston is a graduate of the architectural school of the Massachusetts Institute of Technology in that city, and the composition by which she was fortunate enough to win this coveted prize has all the marks of a first-class school problem, intelligently studied according to academical methods, and may fairly stand in this national exposition of architecture as a good example of the sort of training given in our best professional schools. As such, it is proper that it should take its place with the other architectural works in Jackson Park, and it is eminently proper that the exposition of woman's work should be housed in a building in which a certain delicacy and elegance of general treatment, a smaller limit of dimension, a finer scale of detail, and a certain quality of sentiment, which might be designated, in no derogatory sense, as graceful timidity or gentleness, combined however with evident technical knowledge, at once differentiate it from its colossal neighbors, and reveal the sex of its author.

The manner in which the plan of the Women's Pavilion has been conceived and laid out requires but little concession of criticism in favor

of inexperience. In this structure it was intended to accommodate a general exposition of woman's work, whether industrial, artistic, educational, or social. It was to include departments for reform work and charity organizations, a model hospital and kindergarten, a retrospective exhibition, one or more assembly-rooms of various sizes, with libraries, parlors, committee-rooms, and offices. These various services were to be provided for within an area 400 feet long northward by 200 feet wide, lying next north of the Horticultural Building, and in the axis of the Midway Pleasance. These general dimensions, and the comparatively small scale of the building, suggested 10 feet as a module of proportion, and upon this basis it was found convenient to develop the plan and organize the elevations.

The differing and somewhat undefined uses to which the building was to be devoted seemed to require a series of connected rooms of various sizes, all subordinated to a great hall or *salle des pas perdus* of architectural character. Certainly, enough of these subordinate apartments were required to make at least two stories necessary. With reference to lighting, circulation, and economy of space, evidently the most convenient and the simplest way of adjusting the plan was to place the great hall in the middle, to free it from columns, to build it high enough to receive light through clearstory windows, and to envelop it with a lower two-storied structure forming the four façades of the building. From the floor of this hall a convenient communication could be established with the minor halls and offices around it, so that the whole first story could be utilized. In the second story it was apparent that the necessary intercommunication could be effectively provided by surrounding the open central area of the hall by a system of corridors, which should also serve as galleries overlooking the hall, after the manner of an arcade or cloister around an Italian cortile. In order to obtain adequate area for them, this enveloping series of rooms should not exceed 80 feet in depth, and should borrow all the light possible to be obtained from the central hall, or their illumination by daylight would be seriously imperiled.

The exterior expression is evolved from these conditions. The other buildings of the Exposition covering much more extensive areas without any great superiority of mass vertically, their architects have generally found it necessary to emphasize the vertical lines as offsets to the horizontal, and to include two or more stories in one colossal order, thus bringing the architectural scheme into scale with the vastness of the structure. On account of the comparatively small extent and scale of this building, it did not seem to require any such emphasis of ver-

tical lines, and therefore it was proper to permit the two stories to be frankly expressed in its architecture. The architect found that the strong horizontal lines thus created in the façades could be adjusted harmoniously by making the first-story order 21 feet, and the second 23 feet high, the whole resting on a continuous 5-foot stylobate or basement, thus giving about 50 feet as the height of the outer walls. In establishing the general vertical divisions of the main front, Miss Hayden naturally followed the conventional system of a central frontispiece with a pavilion at each end, connected by recessed curtain-walls. The depth of the suites of rooms on the north and south fronts conferred on the end pavilions a width of 80 feet, or eight modules. Over the low roofs of the enveloping suites the clearstory and roof of the lofty central hall should assert themselves as essential features of the exterior. We thus have a frontage fairly blocked out.

In this way the building is massed after the manner of the villas of the Italian Renaissance, and to this school the design is naturally indebted for those details on which the character of the design as a work of art must largely depend. From this point the architect probably developed the work somewhat as follows:

The first story of the curtain-walls between the central and end pavilions must be brought forward nearly to the face of the pavilions to form an exterior portico or ambulatory, its roof serving as a balcony or terrace to the recessed second story. This first story of the curtain-walls she treated as an Italian arcade in 10-foot bays without columns or pilasters, surmounted by a balustrade, while upon the second she imposed a full order of pilasters rather suggested by, than strictly following, Corinthian precedents, with windows between, all adjusted in scale to the almost domestic proportions of the rooms within. The central entrance should take not less than three arches similar to those of the arcade, and should be surmounted by a colonnade of the order adopted for the second story, inclosing a loggia connected with the balcony or terrace to which we have referred, the whole being flanked on each side by a space of solid wall decorated with coupled pilasters on each story, and surmounted by a pediment developed from the main cornice. Practically the same treatment may be repeated on the front face of the two end pavilions, but without the pediment, and also on the side entrances, which, however, should not have a pediment, as that would bring them into competition with the main entrance, and cannot have a loggia, because of the interior conditions of plan. The colonnade must therefore be replaced by a corresponding range of pilasters. But these side entrances may be distinguished by a low

attic, constituting, for this part of the building, a third story of small rooms, opening on each side on roof-gardens, which should extend over the end pavilions, surrounded by an open screen formed of an order of light Ionic columns, with caryatids over the loggia below, all after the manner not unusual in the terraced gardens of Italian palaces. The central hall is  $67\frac{1}{2}$  feet wide by nearly 200 feet long, and attains an exterior height of 64 feet.

Under the circumstances explained, the design is rather lyric than epic in character, and it takes its proper place on the Exposition grounds

with a certain modest grace of manner not inappropriate to its uses and to its authorship.

After an extremely vigorous and hardly contested competition among sculptors of the gentler sex throughout the Union, the sculpture of the main pediment, and of the typical groups surmounting the open screen around the roof-gardens, was awarded to Miss Alice Rideout, of San Francisco. It is needless to say that the subjects are emblematic of woman's great work in the world, and that criticism will be glad to recognize in these compositions all the noble and poetic qualities of art which they aim to set forth.

*Henry Van Brunt.*

## THE SUNSET THRUSH.

IS it a dream? The day is done —  
The long, warm, fragrant summer day;  
Afar beyond the hills the sun  
In purple splendor sinks away;  
The cows stand waiting by the bars;  
The firefly lights her floating spark,  
While here and there the first large stars  
Look out, impatient for the dark;  
A group of children saunter slow  
Toward home, with laugh and sportive  
word,  
One pausing, as she hears the low  
Clear prelude of an unseen bird —  
"Sweet — sweet — sweet —  
Sorrowful — sorrowful — sorrowful!"

Ah, hist! that sudden music-gush  
Makes all the harkening woodland still,—  
It is the vesper of the thrush,—  
And all the child's quick pulses thrill.  
Forgotten in her heedless hand  
The half-filled berry-basket swings;  
What cares she that the merry band  
Pass on and leave her there? He sings!  
Sings as a seraph, shut from heaven  
And vainly seeking ingress there,  
Might pour upon the listening even  
His love, and longing, and despair —  
"Sweet — sweet — sweet —  
Sorrowful — sorrowful — sorrowful!"

Deep in the wood, whose giant pines  
Tower dark against the western sky,  
While sunset's last faint crimson shines,  
He trills his marvelous ecstasy;  
With soul and sense entranced, she hears  
The wondrous pathos of his strain,  
While from her eyes unconscious tears  
Fall softly, born of tenderest pain.  
What cares the rapt and dreaming child  
That duskier shadows gather round?  
She only feels that flood of wild  
Melodious, melancholy sound —  
"Sweet — sweet — sweet —  
Sorrowful — sorrowful — sorrowful!"

Down from immeasurable heights  
The clear notes drop like crystal rain,  
The echo of all lost delights,  
All youth's high hopes, all hidden  
pain,  
All love's soft music, heard no more,  
But dreamed of and remembered long —  
Ah, how can mortal bird outpour  
Such human heart-break in a song?  
What can he know of lonely years,  
Of idols only raised to fall,  
Of broken faith, and secret tears?  
And yet his strain repeats them all —  
"Sweet — sweet — sweet —  
Sorrowful — sorrowful — sorrowful!"

Ah, still amid Maine's darkling pines,  
Lofty, mysterious, remote,  
While sunset's last faint crimson shines,  
The thrush's resonant echoes float;  
And she, the child of long ago,  
Who listened till the west grew gray,  
Has learned, in later days, to know  
The mystic meaning of his lay;  
And often still, in waking dreams  
Of youth's lost summer-times, she hears  
Again that thrilling song, which seems  
The voice of dead and buried years —  
"Sweet — sweet — sweet —  
Sorrowful — sorrowful — sorrowful!"

*Elizabeth Akers.*

# THE CHATELAINE OF LA TRINITÉ.<sup>1</sup>

BY HENRY B. FULLER,

Author of "The Chevalier of Pensieri-Vani."

VII.

MERAN: FANCY LIGHTS ITS FIRES.

THE apparition of Saitoutetplus was vivid but brief: apparently he had posted to Botzen simply to show what he could do when he tried, and what he would do before suffering himself to be thwarted; and he almost immediately posted back again. He declined to be included in the invitation which met them at Botzen from the Frau Baroninn, the mother of Zeitgeist, to pass a week in the family ancestral halls in the Vintchgau, up above Meran; he simply emptied upon the passive Governor several pocketfuls of rocks and documents, and returned straight to Predazzo, to the great relief of his embarrassed *confère*.

To pass from the Dolomites to the valley of the upper Adige was a change indeed; and the Frau Baroninn received her guests on a high-set terrace which jutted out boldly from the rugged front of the Schloss, and which overlooked a wide and graceful expanse of orchard, vineyard, and forest—a tract luxuriant with the grape, the fig, and chestnut- and walnut-trees, sprinkled with numberless castles, villas, churches, and villages, and inclosed by graceful mountains of porphyry, different indeed from those gigantic and extravagant limestone formations whose jagged and soaring bareness had for a fortnight threatened Miss West's days and terrorized her nights.

Aurelia had still further cause for gratification; she was once more united to

<sup>1</sup> Copyright, 1891, by Henry B. Fuller.

her baggage. Her trunks—bigger and more numerous than I should dare to state—had been sent on from Salzburg by some method or other which gave her no concern, and already she had come to feel that if ever in her life she was to have a chance to dress, these halls of pride should be the witness of her magnificence. Already she began to sniff triumph in the air, and she found it easier now to forgive *Zeitgeist* for having peremptorily told her that it was impossible and unnecessary to drag those portentous chests through the Val d'Ampezzo, and across the complication of chains and passes which make up the country of south Tyrol; while the series of protests and bickerings which had accompanied those huge constructions across Switzerland came to be only a hazy recollection. Aurelia had been sheathed in woolen walking-skirts and heavy shoes for more than two months, and she was beginning to feel an irresistible desire to burst into bloom—a process to which time, place, and circumstance now all conduced. She conceded that she was beautiful, she acknowledged that her dresses were handsome, and she was only too certain that the daughters and nieces of the Baroness were doomed to absolute eclipse. One of her gowns, in particular—but we shall reach that presently.

The entire castle and its belongings seemed but a *parterre* contrived for her efflorescence. History and romance, legend and adventure, trophies and tapestries, armory and picture-gallery, chapels and chambers, turrets and stairways, horses and hounds, stewards, tutors, chaplains, lackeys, and foresters, worshipful tenants, and reverencing peasantry—what a background before which to trail the latest confections of Paris! All this for her, Miss Aurelia R. West of Rochester; and yet there were those who postponed Paradise beyond this present life!

Yes, it was Paradise; nothing was wanting but the serpent, and the serpent came along promptly enough.

Aurelia, who was always rendered restless and uneasy by the vicinity of vendible merchandise, and who already had communicated a touch of the subtle poison of shopping to the *Chatelaine*, had felt herself impelled, on the very first morning after their arrival, to go down to Meran to make a few purchases. Not for two weeks had her petticoats grazed a counter, and her gnawing desire to chaffer and bargain was as insufferable as the torture of the opium-eater when his favorite drug is withheld. The *Chatelaine* was also beginning to feel the need of meeting requirements heretofore hardly dreamed of, and so the Baroness sent them down on wheels together.

As they were strolling along the arcades of Unter den Lauben a scrap of paper caught on

the bottom of Aurelia's dress. It was a corner torn from the "*Fremdenblatt*," whose publication had just been resumed with the beginning of the early autumn season; and as she stooped to see if picking would do for her what shaking would not, a name all too familiar flashed from the type to her eyes. She crumpled the bit of paper in her hand, and at the first convenient opportunity she was reading an account of a concert which Mlle. Eugénie Pasdenom had given at the Kurhaus on the previous evening. And if she had turned the paper over she would have learned not only that Mlle. Pasdenom was stopping at the *Habsburgerhof*, but that *Tempo-Rubato* and *Fin-de-Siècle* were at the *Erzherzog Johann*.

It may be imagined that if the Duchess (with a voice so limited by nature and a constituency so limited by place and season) was attempting concerts in the Tyrol, her original plan had undergone considerable modifications. In fact, the tour projected in the first place had turned out none too satisfactorily, and she had brought it to an abrupt termination several weeks before. After all, she was abroad largely for recreation, she had plenty of other things to occupy herself with, and three or four of the secondary lights of her troupe were quite enough for the carrying out of her latest idea. Doubtless this new departure had been an embarrassment to her manager, yet there were other managers that she had not merely embarrassed, but ruined. And possibly it was a bit trying to the humble members of the chorus and orchestra, too; but then the Duchess never descended to details. Upon her breaking with her *impresario*, *Tempo-Rubato*, whose self-confidence was equal to any undertaking, had thrown himself into the breach. He was willing to engineer any new enterprise that she might care to embark in. He would be her *impresario* or her financial sponsor; he would do the baritone parts, or the leading tenor ones if they could be brought down a third; he would take tickets, or he would shift the scenery. On the spur of the moment he proposed a little tour on the other side of the Alps: Verona, Brescia, Bergamo, and so on, ending with Milan, where the people would, no doubt, be overjoyed to have a revival of "*Orphée aux Enfers*" on the stage of La Scala. And when she seemed likely to resent this obvious sarcasm, he intrepidly suggested another tour—one beginning at Trieste and running along the coast of Dalmatia; he himself would charter a steamer. There was *Capo d'Istria*, where ten thousand people had probably been waiting all their lives to form an acquaintance with *Offenbach* and *Le Cocq*; there was *Pola*, the principal station of the Austrian fleet, whose officers would rally as a man; there was *Fiume*, and she could then

say that she had been in Hungary; there was Zara, where she might count upon the influence of a good friend of his, a personage once high in the political world and a devoted supporter of the opera, but now residing in retirement and cultivating roses, as Diocletian at Spalato had cultivated cabbages; there was Spalato itself, and Ragusa, and Cattaro, where they might give the Turks a chance to form an opinion of "Fatinitza," and where she might buy a prayer-rug, if she fancied.

The Duchess ignored the amphitheaters, and cathedrals, and Venetian campaniles of the Dalmatic coast, but she shed angry tears at the prayer-rug—two of them, one from each eye. He was not to speak to her in that way; she would not listen to anything of the kind. He retorted that she should listen, to anything of that kind or of any other kind. Then there had been neither listening nor speaking for three days, and then they had come together through the Vorarlberg into the Tyrol. And then, two days after the arrival of the Governor's party at Meran, they crossed over the Brenner to Italy.

But before she departed, Aurelia West had a glimpse of her. One afternoon the Frau Baroninn ordered out her coach,—in whose crested panelings and so on Aurelia took great pride,—and bowled her young visitors down to Meran again. As they rolled along the Wassermauer they observed a couple strolling along intimately enough under the poplar-trees close to the stream. The costume and carriage of the lady would have distinguished her anywhere, and the gentleman, who walked along with his head inclining over toward his companion, and who trolled a small pug-dog in their wake, was easy enough to recognize. Aurelia looked straight ahead with a non-committal stare, and the Chatelaine, about whose ears the leaves of the tree of knowledge had lately been rustling, looked sternly in the opposite direction; but the Baroness deliberately put up her glasses and gave the pair a leisurely and minute survey. Seldom before had she seen her abstruse and self-absorbed son exhibit such an effect of unconsciously ecstatic complacency, and she was interested in noting the person who could bring about so striking a change. Aurelia's feeling, however, was far from being one of curiosity. She was impatient with *Zeitgeist*, and indignant at him. She was beginning to feel that she had more cause to complain of him than he of her; and as the couple passed along the walk in a state of smiling preoccupation, Aurelia's wits began to work still more rigorously and insistently upon a problem which had lately come to occupy her, and which was daily taking more and more of her attention.

Here was Bertha, the Chatelaine of La Trinité, a beautiful young creature, well born, well bred, fair, fresh, wholesome, with position, family, estate, yet who was there that appreciated her? Not *Fin-de-Siècle*, whose interest was hardly above the level of an impertinent curiosity. Not *Tempo-Rubato*, whose treatment of her had scarcely been more than an indulgent condescension. Not *Zeitgeist*, surely, who, with the best opportunities of all, was finding more of interest at this very moment in the strange woman from Paris. What *was* this creature's charm? She was not really beautiful; she was not actually clever; she certainly could lay no claim to family. Was it style, was it audacity, was it experience, was it the genius of worldliness? Could this be the model that the great work of reconstruction designed by her, Aurelia West, must follow—a model so shocking, yet so impelling? But *was* it so shocking, after all? Who, if not the *Pasdenoms*, gave the tone to the capital which she herself had voluntarily selected as a place of residence? Who else set the pace, governed the mode, suggested and regulated manners, costumes, amusements? But deliberately to pattern the reconstructed Chatelaine on such lines as these—oh, no; there must be a dreadful hitch in her logic somewhere; surely there must be some other theory upon which she could proceed, and she must have the wit to frame it.

Aurelia, in fact, was feeling within her the impulse to produce a work of art. Some of the ideas on this subject that *Fin-de-Siècle* and the Governor had battledored back and forth had fallen on the ground,—good ground,—and now, watered by Aurelia's assiduous regard for the Chatelaine, promised to spring up and to produce an abundant harvest. Aurelia had no hope of achieving a work of art that could be ranged in any conventional or recognized class. She fully realized that the grandest productions of the native American genius had not been brought about by the work of man in clay, or color, or catgut, or calligraphy, but by the working of man on man. She would not attempt to subdue marble or to make color captive, but she was anxious to show what might result from the working of woman on woman.

Well, then,—to go over the ground again, carefully and in a different direction,—here was the Chatelaine, whose attractive personality had been thoroughly canvassed already. Consider, now, her status. She was the last of a long race: two grandfathers, four great-grandfathers, eight great-great-grandfathers, and so on and on, each of the series possessed of a name and title, a niche in history, and a portrait in the family gallery. She held her

position in her own right; on her had descended the accumulated fortunes of the family; from her high-perched castle she swayed it over a valley of peasantry, doting and complaisant, no doubt, to a degree. What position more lofty, more gracious, more noble? Ah, she had it! The whole situation was brilliantly clear, absurdly simple. It was merely a case of goddess and pedestal; only the goddess must be made to feel that she *was* a goddess, and to see that her proper place was not beside the pedestal, but upon it. And now a friendly Intelligence had come to show the divinity how to mount to her place, or, if need be, actually to lift her to it. And under these altered conditions worship would follow as a matter of course.

Such, in brief, was the program evolved by the transported Aurelia while the carriage rolled rapidly along on its graveled way, and the Baroness and the Chatelaine sat silent side by side. Not merely those uncertain young men were to see what she could do, but the Governor himself should be a witness to her skill; he was to see all of his own lofty lucubrations about arrangement and presentation and the rest reduced to working order. And as for her own poor self—that was a paltry candle to be snuffed forthwith, since all the light was to fall on quite a different part of the stage. So overjoyed was she to think that Providence had sent the Chatelaine a friend so dexterous, so sympathetic, so self-sacrificing, that she broke the stern silence with a laugh, a most undeniable one. Both her companions looked at her disapprovingly, and she felt that in the Chatelaine's eyes she had slipped back to the precarious ground on which she had stood at Lucerne, while the aspect of the Baroness was such as to make it seem likely that the rest of her visit might have to be spent in reinstating herself in her hostess's good graces.

Aurelia fancied that she had already made a very fair estimate of the castle, but she received quite a new impression of the possibilities of the place and of the general pleasantness of hereditary distinction on the occasion of the celebration of Zeitgeist's own birthday, for which fête the banners were, indeed, hung on the outward walls, and the cry might well have been, "They come!" The magnates of the district came with their wives and daughters; the sons came with their spurs and sabers; the tenantry came tramping up the valley and flocking down from the mountains with music and addresses and torches and hurrahs. What a delightful situation, thought Aurelia, this right to cheers as a mere matter of rank and descent! How vastly better than the situation in poor, crude America, where if a man wanted hurrahs he must hurrah for himself. The turmoil of preparation for this observance put our

enthusiastic Aurelia quite beside herself. What a grand opportunity to take the Chatelaine's measure, to hold a full-dress rehearsal of the drama which was to be enacted at La Trinité, to revise the draperies of the statue before it came to rest on its own proper base! With what emotion did Aurelia lift these draperies from the recesses of the biggest of her big trunks! They appertained to the one conspicuously magnificent creation of the entire wardrobe, a Parisian inspiration, the emanation of a master mind,—a talent of such a high order that to many of its patrons only a thin partition divided it from genius,—a mind that, when it judged itself, broke through even this. It was this garment that Aurelia herself had fondly hoped to wear; but with a look of high resolve she thrust this flattering idea aside, and when she glanced at herself in the mirror she was rewarded by seeing, if not a martyr, at least a heroine. Her mind was big with one idea, her imagination was in a state of conflagration; and it lighted up an image of a beautiful creature (adequately attired) sailing in stately fashion down the crimson covering of a marble staircase, while a loud announcement heralded the coming of The Most Noble and High-born (supposing that to be the proper form), the Lady Berthe Gloiredesalpes (supposing that to be the exact name), the Chatelaine of La Trinité, and the This of That, and the That of The Other (which sketchy string of titles stood subject, of course, to revision in light of later and more detailed information). After which burst of poetic frenzy the sibyl confessed herself exhausted, and threw herself upon her bed.

But not to lie there long; she was too excited to rest, and there was a good deal to do before she could adjust the Chatelaine to her new attire. For the Chatelaine had none too high a notion of her own merits, and she was inclined to hang back a little bashfully from so novel an experience; even when she had finally been induced to try on things experimentally, it was seen that a good many changes would have to be made before the ideal was reached. There was also the matter of gloves and shoes; Aurelia's hands and feet were absurdly small. These and kindred matters necessitated a good deal of snipping and basting within the castle, as well as repeated excursions down to Meran.

But the end crowns the work, and when the Chatelaine finally came to stand before the clustered wax-lights that surrounded Aurelia's long mirror, and took a final view of herself previous to treading the crimson-covered marbles that had filled so important a place in the mind of her imaginative friend, the artist joyfully expressed her unqualified satisfaction. The Chatelaine gazed at her own reflection with big, startled eyes, and as she moved about, and heard the

low swish and rustle of the silk and lace and tulle dragging behind her, a fearful joy possessed her, her spirit rose mettlesomely, new vistas of surpassing reach and splendor opened before her, and life, she began to feel, included a great many things the existence of which she had not heretofore even suspected. Then the high priestess administered the final touch — with a powder-puff. There was really no practical reason for this, since the Chatelaine's complexion was perfect; perhaps Aurelia regarded this rite as a kind of secular sacrament by which the Chatelaine was admitted into society.

The Governor was startled, delighted, electrified. He would have asked nothing better than to spend the whole long evening in rapt contemplation of his metamorphosed godchild; but the Baroness appreciated him almost as much as he appreciated the Chatelaine. She knew that but for certain disagreeable events in the first years of the century her guest might have been a reigning prince,—not Professor, but Elector, —and so she was disposed to make the most of him. The Governor always professed to be bored by this particular line of historical reminiscence, and perhaps he was. He almost always told the truth; so I suppose we may believe him — or not. The Baroness had an idea, too (quite an erroneous one), that the Governor was an old man, and she considered that she was properly placing and honoring him when she led him to the card-room, with the other elders, and sat down opposite him for a game of cribbage. But his play could not have increased the Baroness's admiration. It was erratic, terribly *mal à propos*, constantly disturbed by little fits and starts as the crowd of young people surged by, and incessantly punctured by sudden sidelong glances through doors and windows. The Baroness cut, shuffled, dealt, and pegged with her pudgy hands, counting up the Governor's knave of trumps once or twice, and frequently seeing fifteen-six where he had seen only fifteen-four. She presently gave up her place to her sister-in-law, who cut, shuffled, dealt, and pegged with *her* pudgy hands, catching the Governor's knave once or twice more, and seeing fifteen-six where he had seen only fifteen-two. Meanwhile, whiffs of perfume and melody came floating in from without, there was a muffled sound of shuffling feet from the ball-room, and now and then the tones of fresh young voices came in through the windows that opened on the terrace. The Governor blundered on, misdealing, misplaying, miscounting, while the sister-in-law raised her surprised eyebrows higher and higher until once they were almost lost under her wig. Then, all of a sudden, the Governor threw down his hand, face up, and rose to his feet. His startled opponent looked toward the wide doorway, too: the Chatelaine was passing. She trailed by in a kind of slow and stately splendor on the arm of a tall young cavalry officer. Her face was delicately flushed, her eyes sparkled with a vivacious sense of triumph, and she lowered her high-poised head to the Governor in such a fashion as to leave the old gentleman weak and trembling with delight. Behind her, in company with a Serene Insignificance from Vienna, walked Aurelia; she was looking out sharply on the Chatelaine's behalf for entangling spurs, and was holding herself in readiness to administer stimulant in case the conversation required it, being seldom at a loss for a notion and never for a word. She did not look especially magnificent, having given the Chatelaine not only the best of her wardrobe, but the best of her jewel-case as well; yet her face glowed with pleasure, and it was a face, let me say, to which nothing was more becoming than an idea.

Aurelia's satisfaction was complete when Zeitgeist put on a grand manner,—he wore his spectacles, too,—and took the Chatelaine in to supper. She saw that he did not do this simply because the Chatelaine was a special and particular guest, nor because of his mere indebtedness to the Governor. No; he did it be-

cause he enjoyed doing it, and he did it as if the doing conferred a distinction upon himself. Ah, very good; the young man was not blind, after all; he recognized the sun when he saw it shining. And there were others to whose notice she should like to bring the same heavenly phenomenon.

During the few remaining days of their stay other fêtes followed at other places, and it gratified Aurelia to see the Chatelaine's altered attitude. Bertha apprehended this new world keenly, she entered into it with a satisfactory readiness and self-possession, and it began to look as if she was soon to be completely at home in it and thoroughly committed to it. In nothing was this shown more clearly than in the manner with which she met Zeitgeist's suggestions for excursions—Meran being nothing if not excursions, while walks and points of view abound. Every other height for miles up and down the valley, for instance, held out its ruined castle; the Chatelaine walked up to one or two of them, though with some indifference: why did they offer her castles draped with ivy and dedicated to the dismal owl, when others, just as near, were garlanded with flowers and flooded with the melody of the waltz? They talked tentatively to her of the Alps of the Oetzthal, of the snow-peaks and glaciers of the Ortler; but she had lived, thought, eaten, breathed mountains all her life, and she was now beginning to feel that nothing would please her more, say, than to put on a long-trained gown and to trail it through Holland. The Baroness took her to the old residence of the counts of Tyrol in Meran, and put before her its display of frescos and painted glass and armorial bearings; but the Chatelaine saved her interest for the Kurhaus, the band, and the promenade. The Governor rambled about alone, picking up his pebbles and his flowers for himself. The old order was changing; the powder-puff had begun to do its work.

## VIII.

## VERONA: THE VERY REALM OF LOVE.

THE Chatelaine's share in the musical doings at the Schloss did not end with her tripping to other people's pipings, for she did a little piping of her own—if one may allude in such a way to the piano, the only instrument over which she had command. For the spoils of Salzburg yielded many a duet and trio, nor was Zeitgeist without such a knack in the direction of musical notation as was required to fasten a few of his own ideas on paper. The fount of melody was beginning to flow within him, and he had his piano trundled out to a certain arched corner of the terrace, from which retreat the mingled tones of that some-

what discredited instrument and the violoncello rose on several afternoons to the ears of the Baroness in her chamber above. Their work was principally on compositions of his own; most of them having been turned out, too, since their emergence from the Dolomites. There were few trios among them, the *flauto transverso* having more or less dropped out of the combination; but Aurelia West pleased herself with the belief that many of them were duets. A more discriminating critic would have detected their true nature: they were simply cello solos, as elaborate and showy as the Baron's technic permitted, with accompaniments, quite simple and completely subordinate, for the piano. But Aurelia was no critic; so when Zeitgeist's little finger trembled with a pathetic wabbling on the A string, or his middle one slid with a desolating moan the full length of the D, or a light touch from one or the other sent canary-like harmonics through the trellised vines about them (the poor Chatelaine, meanwhile, pegging away steadily with her prosaic chords), their listener almost saw the heavens opening; she even forgave Zeitgeist for having once told her, as they sat in front of the Casino at Interlaken, that the selection the band was playing was the "Ah, che la morte," that this air was from "Il Trovatore," and that "Il Trovatore" was an Italian opera by Verdi. And after he had given the Chatelaine a little piece which he had composed for her, and dedicated to her, Aurelia would have forgiven him even worse.

And she forgave him all future offenses, too, when he said that he had half an idea of accompanying them part way down to Italy. On the Governor's suggesting that they might leave the railway at Trent and piece out the journey with a carriage-drive along the shore of the Lake of Garda, the other half of the idea reached him, and when it came time to set out, his baggage was in as complete readiness as theirs. Aurelia attributed all this to the Chatelaine, choosing to ignore the fact that Zeitgeist and the Governor usually got along very pleasantly together, and the other fact that the curling waves of Garda, along with the pillared vineyards and lemon-groves of Riva, made a sufficient reason of themselves. But even the finest mind cannot hope to cover a wide field completely.

It was the middle of the second afternoon when the carriage turned away from the shores of Garda and struck out over the highway to Verona. And it was within some ten miles of Verona that their *vetturino* made his last halt for rest and water. This occurred at a little town that spread itself out long and thin in its attempt to inclose a very large piazza—a piazza dull and grass-grown, with a café and

an inn vis-à-vis. And while suitable refreshments were being ordered on one side of this inclosure, our friends noticed a small crowd collected on the other,—sixty or seventy people, about half the population of the place,—where a mountebank show appeared to be in progress. Two or three men in loose and shabby trunks were trying to fasten more firmly a set of turning-bars, while a horn and a clarinet rasped the excited nerves of the bystanders. Three or four tiny fellows, their fathers in miniature, stood timidly about, subject to a call now and then from a frowzy head thrust through the flaps of a covered wagon; while a tall, stout young woman, with a head of tousled blonde hair, posed around in soiled tights and short, gauzy petticoats, and made an occasional sally at the audience with an extended tambourine, a gesture the significance of which few of them seemed to comprehend. Within twenty feet of her an empty carriage stood before the door of the inn; and when she saw a full one on the opposite side of the square, she crossed over bareheaded through the sun with a long, heavy, swinging stride, and a dozen ragged urchins at her heels. She appeared to be a simple, stolid, good-natured young person, to whom business was but business, and to whom the ephemerality of gentry on wheels was a well-ascertained fact. The young ladies viewed her with a considerate interest, and did not encourage Zeitgeist in his feint of having impressed her; and the Governor gave her a florin.

They had already noticed the empty carriage on the other side of the square, and they concluded that it belonged to a small party of people who, they ascertained, were seated beneath a striped awning on a balcony over the inn door; they appeared to be dividing the suffrages of the town with the performers, whose slow dullness they were endeavoring to spur on with an ironical applause. The show, however, went on its own limping way,—long preparation, great promise, little performance,—a vast parade of hoops and poles, a loud din of march and polka, a gradually dawning belief on the part of the simple-minded villagers that something was really going to happen, yet everything flat, riskless, inconsequent. All at once another figure emerged from the doorway of the inn,—a tall, dark man whose body carried trunks and tights like the rest, with the full allowance

of frayed lace and tarnished tinsel, but whose face showed an amused, indulgent, condescending smile that none of the others could have achieved in ten generations. His large, full neck rose from a deep chest and a broad pair of shoulders, and his arms, bare to the pits, showed forth the muscles of the accomplished athlete. He advanced with a strong, springy step, and then with a long leap suddenly launched himself upon the bars, on which he turned, spun, balanced, swung, with all the conscious mastery of one who fully knows the ropes. The horn and the clarinet, after their first gasp of surprise, fell to with redoubled vigor, the assembled urchins shrieked with a shrill delight, and a group of sun-browned women, with shawls over their heads, looked on with a fascinated stare. More twists and turns, more springings and swingings; then some vaulting; then some mighty juggling with dumb-bells. A lady who sat up under the awning had rested a magnificent bunch of great flowers on the railing before her; she tore them eagerly apart and showered them down with both hands. Some one behind her clapped his palms together, and called out, "Bis! bis!" in a high tenor voice. The athlete stuck one of the flowers into his belt, scooped up a dozen more of them and gave them with a flourish to the girl of the tambourine, satirically acknowledged the applause of the villagers and of the mountebanks themselves, ran his long fingers through his damp locks, and stalked back into the inn.

The Governor looked at Bertha and Aurelia, Bertha looked at the Governor and Aurelia, Aurelia looked at the Governor and Bertha, and Zeitgeist looked at all three, wondering. This acrobat was the man whom they had met on the Lucerne steamer, and who had called himself the Marquis of Tempo-Rubato. They had scaled him down from a nobleman to an inferior opera-singer; now, it seemed, they must reduce him from this last grade to that of a mere strolling tumbler. In what rôle would he next appear? That of an ashman, a ragpicker? Could insolent assurance go further? The Governor ordered the *vetturino* to an immediate advance on Verona. Nor need he spare his horses; the greater the speed, the greater the relief.

Thus, under the impulse of indignation, the pleasant town of Verona came presently into view, with amelioration in the towering campanile of the Municipio, the long front of the lofty fortress, and the soaring cypresses of the Giusti gardens. Sunset found them domiciled in a little hotel situated on a back street, but fronting immediately on the river, an establishment to which Zeitgeist had guided them, and in whose German-speaking waiters and

porcelain stoves he took a certain national pride. They dined, in front of the house, on a fish which an engaging waiter had lately brought up from the stream expressly for their meal, and the same atmosphere of general good nature was presently lulling them all to a slumberous forgetfulness of Latin effrontery.

No town can have a stronger claim on the regard of the appreciative traveler than Verona. Few monuments are nobler than its Roman arena or its Lombardic churches; few inclosures more picturesque than its churchyard of Maria Antica, with the Gothic monuments of the Scaligers, or its Piazza delle Erbe sprinkled with the white umbrellas of the market-women; few streams more quaintly pictorial than the rapid Adige bearing up its flock of mills on bobbing scows; few gardens more grateful than those of the Villa Giusti, pierced by steep avenues that lead up to a wide view of Alps and Apennines: but all these were not the things with which the active mind of Aurelia West was most concerned. She now regarded the visit to Verona in the light of a pilgrimage (however she might have regarded it a month previously), and it was not Verona so much as the Amanti di Verona that filled her thoughts. It is in places like Verona, full of features of the second rank, but without one absolutely of the first, that a large party may fall a victim to some one of its members who happens to have a definite idea. Aurelia West had a definite idea, and it led them all, without let, hindrance, or delay, to the mansion of the Capulets.

Medieval magnificence, like medieval manners, needs to be judged by a standard more or less its own, a truth not fully realized by this enthusiastic cicerone. She had seen most of the great Juliets of the day,—there are dozens of them, scores,—and she was familiar with the fervid imaginings that provided each with her own "scenic investiture." But the actual home of the Capulets is pitched in a key much more subdued, and if Aurelia's mind had not been in the broadly poetic condition that can digest all crudities and incongruities, she might have left this lordly and storied house with a sense of disappointment—this house "whence"—as we learn from the tableted front—"whence fled that Juliet for whom so many tender hearts have mourned, so many poets sung." The house is doubly authenticated. Besides this inscription there is the *cappelletto*, the little stone hat, which is set over the low archway leading to the inner court, and which has come to be almost as well known as the papal tiara. It was under this archway that the first member of the family came to greet them, a personage whom the Governor, willing to amuse and to be amused, identified as the bloody Tybalt; and he, in the midst of a

lamentable outcry, was driving forth a little Montague who seemed to have been pulling the hair of one of the little Capulets. It was he, in fact, who drew their attention to the *cappelletto*, and his crooked fingers and yearning eye seemed to hint that such a service was entitled to recognition. The rest of the family were also found at home, though not especially prepared for visitors; six centuries of the glare of publicity have probably rendered them indifferent. Nor was the stage set with the ornate care that we have come to expect for the latter part of Act I; the courtyard was noisy with a great ado of horses and donkeys, and carts and wagons and water-drawing, while spread around over many balconies sat many of the company, quite careless of their cues. Up in that of the second story was old Capulet, smacking noisily—he always *is* rather noisy, if you recollect—over a plate of soup, and on the next stage above appeared the Nurse, knitting a sock, but not allowing that to interrupt the flow of gossip with other females of the house. A girl drawing water at the well Zeitgeist claimed to identify as the heroine herself, though the Governor proposed another candidate for the honor—one high up in the loftiest balcony of all. She glanced back and forth between the visitors and something that she held in her hand, an implement that the Governor declared to be a curling-iron, though Zeitgeist contemptuously termed it a lemon-squeezer. But there seemed to be no tendency to rant in either young woman, and so the point remained undecided. The matter of the balcony was more perplexing still; the entire courtyard was balconied only too thoroughly, to say nothing of the front of the house itself. The puzzled eye of the Chatelaine roamed about hither and thither, in a vain attempt to find some place to rest, and Aurelia, who was pleased to notice that Bertha was taking matters with an appropriate seriousness, plaintively inquired if the balcony might not look on some garden or other behind the house. They came away with that point also left open; but Zeitgeist had attempted no heavy-handed analysis of the Juliet-myth, the Governor's recollection of Julia Placidia had kept him in a mood tenderly considerate, and Aurelia was therefore able to regard their visit as a reasonable success.

The house of the Capulets disposed of, Aurelia's next achievement was the tomb of Juliet. The one she had approached with respect, but the other she drew nigh to with reverence; it was all the difference, in fact, between narthex and sanctuary. The road to this place of sepulture is long and devious, and leads by way of barracks, and stone-yards, and stretches of dusty openness to a remote edge of the town. Aurelia and the Chatelaine carried between

them a large pasteboard box, the contents of which seemed precious beyond their weight, and demurely followed the Governor, who himself followed the seven-year-old boy that was acting as their guide. They had thrown themselves on his good offices at one period of their pilgrimage when the way had seemed involved in grave uncertainty, and the Governor, who was fond of talking with little boys who had black eyes and bare legs, left the two young women to entertain each other and to guard the wreath. The Governor had asked the lad who "Giulietta" might be, and he had simply replied that she was dead. The precocity of this answer, and the assurance which it conveyed that they were not proceeding on false premises, quite charmed the old gentleman, and he rewarded the child for this brief obituary on a scale that might almost have seemed lavish for a complete biography.

Just at the entrance to the garden they encountered two gentlemen; the first was Fin-de-Siècle and the second was Tempo-Rubato, whose present aspect rather delayed recognition. Both were perspiring freely, though the day was cool, and Aurelia conjectured, despite their leisurely manner, that they had been following from afar and had taken a hurried cut to reach the gate first. Tempo-Rubato in his present guise suggested neither an ashman nor a rag-picker. He wore a black frock-coat, a pair of pearl-gray trousers, a high hat, and a flower in his buttonhole; and our friends, who had never before seen him in the ordinary dress of every-day life, were willing enough to acknowledge that under a combination of felicitous circumstances the ideal of the tailor's fashion-plate might readily be reached. Clothed he was, indeed; and Aurelia hoped that he was in his right mind, too; certainly this was no place to balance on a tight rope stretched between decency and indecency. And as for Fin-de-Siècle, let him but repeat in this sacred place the tactics which had almost turned the interment of Julia Placidia into a travesty, and it would cost him the acquaintance of all three. But Aurelia did not regret the coming of this pair; she was firm in the faith, and what better place was there to combat heresy than at the altar itself? They had probably come to scoff; perhaps they might remain to pray.

The two young men lifted their hats with a careless ease, and came forward with all confidence and complacency. Neither of them had seriously taken Miss West as a person of any great importance, or had treated the Chatelaine with a much greater degree of deference than she had been able to exact. Tempo-Rubato, indeed, appeared to think that it would be a very simple matter to resume the easy attitude of the Lucerne steamer, with all its gen-

eral informality of a midsummer outing; but he now found a line drawn that he did not remember to have noticed before. The Chatelaine received them both with a stately reserve,—she had come to think less highly of them and more highly of herself,—and Aurelia, who was able to carry an air in chorus when she might have faltered in a solo, did what she could to make still more plain to the young men that if they expected to please, they might as well put forth their best endeavors—that their best would be none too good for a young woman of some position and consequence. Tempo-Rubato could read a fairly legible hand, even when the t's were not crossed nor the i's dotted; he felt, too, that the handbox barred all levity. He was as adaptable as an eel, and he would take the pitch of any key that was struck. And if Fin-de-Siècle was too stiff in his own conceit to bend, why, a little dash of cold water would nullify almost any amount of starch.

The tomb of Juliet, as all the world of travel knows, rests in a sort of little

open chapel which sets snugly against the wall of an old monastic building standing in a humble kitchen-garden. In the spring you find the place brightened up by multitudinous apple-blossoms (to say nothing of the shining lettuce and the cheerful pea); warm sunlight, too, and blue sky. But to-day the sky was thinly veiled with clouds, the first yellow leaves of autumn had begun to flutter down, the peas had left their bare beds behind them, only a few lettuces spindled tallishly in a remote corner, and a mild young man with watery blue eyes was dejectedly raking up the paths.

The young man leaned his rake against one of the apple-trees, and led the visitors to the small triple arcade behind which rests the poor old battered sarcophagus whose litter of calling-cards represents the *élite* of all Philistia. Aurelia shuddered as she recalled one of the colony who had told her that their whole party of ten had left their cards for Juliet, and blushed to recall how eager she herself had once been to do the same. Their guide drew attention to a dilapidated old portrait of a dilapidated old

ecclesiastic hanging close by, and when the Governor asked him if it was a Capulet, he replied that it represented the brother of Giulietta's confessor. This young man had an ingenuous face and honest eyes, and appeared to believe what he was saying; but perhaps his researches had been incomplete, or his critical sense not fully developed, or perhaps he had been misled by hearsay, or perhaps he had innocently accepted the statement from some colleague whose pleasure it was to test how far the traveler might believe. Fin-de-Siècle flicked his card into the sarcophagus, patted the young gardener confidentially on the back, and told him that he had a precious work there which he must guard most carefully; the next time they came that way they might bring him a companion piece—a portrait of the stepmother of the second cousin of Giulietta's nurse.

Every one ignored this outrageous sally. Tempo-Rubato frowned, and then stepped forward and declaimed

sonorously some little verses with the refrain :

Io t'amo ora e sempre,  
Romeo, il mio ben.

Aurelia, too, attempted to put into Italian some portion of the celebrated controversy over the lark and the nightingale, when a distant sound of cock-crowing came to amuse the Parisian scoffer; whereupon Tempo-Rubato, with a loud promptness, declared his admiration for the great English librettist, who, however, preferred to accent "Romeo" on the first syllable, just as he accented "Desdemona" on the third. Then he assisted Aurelia to place the wreath properly, and he also found a suitable situation for the little set of elegiac stanzas that the Chatelaine had composed (she had written them in French on a tiny card and in pale violet ink). He furthermore embellished this card with his *boutonnière*, and the grateful Aurelia acknowledged to herself that he was really capable of civilized conduct after all.

She hesitated to make the same concession in regard to Fin-de-Siècle, however much, indeed, he considered the civilized as his own peculiar forte. Certainly, if his *étude* showed no more tact, sympathy, insight, adaptability than its author did, it was likely to prove but sorry reading. However, he, equally with Tempo-Rubato, was beginning to show a creditable disposition to revise his style of address toward

the Chatelaine. On the way back to town they both walked with the Lady of La Trinité, and Aurelia, left behind with the Governor (a neglect which would have touched her keenly a month ago), was glad to notice the dawn of a deference which was clearly the Chatelaine's due. The attitude of these young men toward the maid of Verona was really a matter of secondary consequence; it was neither to make nor to mar the real success of Aurelia's idea, since the heroine of the poet toward whom her thoughts were most definitely turning was neither Juliet, however permeating, nor Desdemona, however accented. No; her mind's eye was fixing a firm gaze on the gracious Lady of Belmont, and in the Chatelaine her idealizing worshiper was already beginning to see the Portia of the High Alps; while the Belmont toward which their steps were moving was not a palace on the Brenta, but a château among the snow-peaks of the Valais.

The Chatelaine herself was still without an adequate realization of the rôle for which she was cast: a distinct gain, since she approximated the dignity of her lofty model without reaching, as yet, its self-consciousness. She pursued the accustomed tenor of her way, with no heed of drama or of spectacle; while Nerissa fidgeted about in her homely little room at the Albergo della Graticola, and burned with an eager desire to shift the scenery and set forth the properties of La Trinité.

(To be continued.)

Henry B. Fuller.

## ITALIAN OLD MASTERS.

TINTORETTO.—1518—1594.

(JACOPO ROBUSTI.)

BY some critics Tintoretto is considered as marking the decline of Venetian art, in the sense of being the first example of this decline. This is unjust and untrue, whether as indicating a falling off in himself, or the decay of the school. Intellectually he was on the level of Titian; but he differed from him mentally and technically—the second as a consequence of the other, probably, but also first because he was not subjected to the very early discipline with which Titian began. That he began to paint late in life, as the old tradition went, is not proved or probable, but the internal evidence of his work points to an utter want of that vigorous early training which alone can give to execution the marvelous sub-

tlety we find in Titian, Michelangelo, Raphael, and so many more of the great Italian painters. The same evidence points to a refractory nature, with intense individuality and an imagination impatient of control. Tintoretto may have begun early to work, but evidently he never submitted to severe discipline; he was born and lived in an atmosphere of art, gathering the sentiment of it with his mental development, and he painted as a poet writes when his life is passed in an epoch and in surroundings charged with poetry. His father, Battista Robusti, a dyer, put him to study with Titian, and the story goes that the master was so envious of his talent that he refused to keep him in his studio—a palpable fable, for so complete a master of all that painting meant at that time in Venice had no reason to envy the best work that Tintoretto ever did. That

he was sent away from Titian's studio is very probable, and it is equally probable that the cause was in the refractoriness to discipline of which his work to the latest shows evidence. Envy is the world's most ready explanation of such a dissension.

The methodical and comprehensive system of Titian, providing in the first painting for the many operations to follow,—a system that had the prevision and preparation of a master's game of chess or a great general's campaign,—was impossible to the overcharged temperament of Tintoretto, in whom the fury of invention could brook no kind of dictation as to the process of delivery. He could never, like Titian, have turned his canvas to the wall, and have waited a month to see it progress a step; his work mastered him, not he his work, and in this is the chief ground of the difference between his art and that of Titian. He is said to have written on the wall of his studio, "The design of Michelangelo, and the color of Titian"; but he would have understood his own case better if he had seen that it was not exactly that which he wanted, but "the invention of Tintoretto, and the patience and the system of Titian," which, if he could have combined them, would have made him the greatest painter the world ever saw.

From the studio of Titian he went to that of Andrea Schiavone, a Dalmatian,<sup>1</sup> if we may judge from his name, and clearly not one of those natures due to the temperament of the serene race of the islands of the lagoons. Schiavone's technical characteristics were more in sympathy with Tintoretto; and though we have no work of the period of his stay with that painter, Ridolfi speaks of a portrait painted in a lamplight effect which was much admired in Venice, a fact which points to the character of his subsequent painting. He had a morbid activity; he would work for nothing but the cost of his materials when he could get no commissions, a habit which was the most efficient obstacle to his getting any. He filled the schools and churches with his compositions, and the fecundity of his genius is almost incredible to men of our day; but most of the work of this period has perished, so that we can say but little of its quality. A "Circumcision," however, in the Church of the Carmine is attributed to this time. The drawing is stiff, the color powerful, and, as is almost invariably the case in his work, the composition inventive. A little later he painted for the Sta. Trinità five scenes from Genesis, two of which are now in the Academy, "The Fall" and "The Death of Abel." The former shows the influence of Titian, and the conception is poetical, but the Abel is hardly characteristic of Tintoretto.<sup>2</sup> (See page 745.)

The impatience of his genius craved great spaces; he longed to paint all Venice, to cover all the blank walls with huge compositions, and he did paint the fronts of several houses for the bare cost of the materials. He painted the "Feast of Nebuchadnezzar" on the arsenal, and, on the wall of a house near the Ponte S. Angelo, a battle and various other subjects, some of which are preserved in Zanetti's "Pittura a Fresco," published in Venice in 1760. He also decorated the Palazzo Zeno, and among other recorded works, in 1545, painted the ceiling of a room for Pietro Aretino. His first very important order, received in 1546, was for the decoration of the choir of the Church of S. Maria dell' Orto, and this, as might be expected by a painter who had been begging the privilege of painting for nothing in a community where the chief customers for his work were the priests, he secured by offering to do it at cost. Of the subjects here, the "Last Judgment" and the "Worship of the Golden Calf" are among his chief works. They have grown black and obscure, and show the defects of his method, but the power is amazing. The common criticism of them is that the detail is extremely defective and has no relation to the expenditure of thought in the design and the power of the whole; but the common critic does not take into consideration the vital facts of the case. Tintoretto was in the habit, as all his biographers say, of studying the place for which his pictures were to be painted; and certainly no place could be found where the elaboration of detail would have been such supererogation as in this choir, where it is difficult with any light to see what is most easily to be seen. The enormous size of the pictures, too, their height being fifty feet, makes it imperative for the observer to keep at such a distance as would render fine details invisible in almost any light, and absolutely so in the semi-obscurity of the choir. The color is not what it was in the day of their painting; it is certainly far more dusky, and the probability is that when the pictures were finished they answered perfectly their purpose of being visible where they are. The artist received a gratuity of 100 ducats for his work, and an order to decorate the organ-case. On the inside of this he painted the "Martyrdom of St. Christopher" and the "Angels bringing the Cross to St. Peter." These are now in the chapel of the high altar of the church, and are fine in color but indifferent in composition; but the subject on the outside of the organ-case, the "Presentation of the Virgin," is fine both in color and in composition. These paintings were the means of bringing Tintoretto into much repute, and

<sup>1</sup> According to Boschini, Schiavone was born in Sebenico, Dalmatia.

<sup>2</sup> Ruskin praises it highly as resembling *grisaille*.

the Brotherhood of St. Mark obtained for their school the great picture of the "Miracle of St. Mark," now in the Academy, where it is not unworthily held, all elements considered, as the artist's most complete work. It is strongly dramatic, powerful in color, and has suffered less than most of the master's pictures from the blackening which, more or less, was the necessary consequence of his method of painting. The "Last Supper" in the sacristy of S. Giorgio Maggiore is more powerful, more imaginative in its composition, and vaster in its technical range; but it is less successful in its general attainment of the finer qualities of art. The execution is ruder, and the display of the knowledge of perspective is somewhat obtrusive. It gives the idea of a painter of great daring and originality, but as art it is distinctly inferior to the picture in the Academy.

The painting of the "Miracle of St. Mark" (see page 747) was followed by an order from Tommaso di Ravenna for three more scenes from the life of St. Mark for the school of the saint. Of these, the "Embarkation of the Body of St. Mark at Alexandria," fine in color and architectural composition, is in the old Nicene library, with the "Rescue of a Sailor from Drowning by the Saint." The third, the "Finding of the Body of the Saint at Alexandria," is in the Church of the Angeli at Murano.

When Tintoretto began his work for the republic is not clear; probably it was not till Titian had made room for him. In the interim we know only of minor works. In 1560 he began to paint in the School of S. Rocco and the Doge's Palace. The school being just completed, the painters were invited to compete for the decoration of the Sala dell' Albergo by sending in sketches; and the other competitors, Veronese among them, sent in very careful designs. Tintoretto took the measure of the palace for the picture, painted it at his studio, and presented the finished picture. When the fraternity complained, and stated that all they wanted was a design, he replied that that was the way he designed. He offered the picture as a gift to the saint, and got the order to paint the ceiling, which was the work in consideration, on the same terms. It was of course difficult for the other artists to compete under such conditions, and the conclusion was inevitable. But in the end he had his reward in the commission to paint the principal picture for the system of illustration, the great "Crucifixion," for which he received 250 ducats, as well as that for the two smaller subjects at the sides of the door opposite the "Crucifixion," the "Carrying of the Cross," and the "Christ before Pilate," for which his compensation was 131 lire. In 1567 he painted three pictures for the church of the confraternity for 135 lire. In 1565 he seems

to have become a member of the confraternity, and these pictures were painted between that time and 1567. After this we are in ignorance of his occupations until 1576, when he painted the centerpiece of the ceiling of the great hall, "The Plague of Serpents," and began the "Passover" and the "Moses Striking the Rock"; but in the latter part of 1577 he proposed, for a salary of 100 ducats a year, to decorate the whole school, at the rate of three pictures annually. The proposition was accepted; but Tintoretto died before he had finished his scheme.

The great "Crucifixion," which bears the date MDLXV, and is signed JACOBUS TINCTORIUS, is generally accepted as the greatest of the painter's works; and the School of S. Rocco might well be called the School of Tintoretto, as it contains the greater number and in some respects the most instructive of his pictures. We find the first evidence of his employment by the state in the receipt, dated December 23, 1560, for 25 ducats for painting the portrait of the new Doge, Priuli; and as prior to this Titian had been the state portrait-painter, it may be supposed that Tintoretto had succeeded to the charge. In the following year the decoration of the walls of the Libreria Nuova was decreed, and Titian was appointed to overlook the younger painters who took part in the work. He seems to have thought that Tintoretto required supervision the most, which is not at all to be wondered at, but the latter succeeded in getting an independent commission for the "Diogenes." He was awarded, next, the painting of the three vacant walls of the Council-Hall.

The battle of Lepanto, fought at this time, was naturally the occasion of a warm competition among the painters for the execution of the commemorative picture. The commission fell again to Tintoretto, as the result of his offer to do it at the cost of the material, an inducement which even the Senate considered conclusive. He pleaded the sacrifice, at a later epoch, as a claim for reversion to the brokership of the Fondaco dei Tedeschi, and this was allowed him in 1574. The great conflagration of 1574, followed by that of 1577, in destroying the works of Bellini, Carpaccio, and Titian, left room for Tintoretto and Veronese, and the former had the greater part in the work of restoration. The list of the pictures included in this vast commission is almost bewildering; but as examples of the range of the artist, one may look at the "Paradise" (painted in 1589-1590), a vast canvas, full of wonderful detail of design and thought, but as a whole perplexed and confused to such a point that its system seems intentionally to have been left without key, and the "Bacchus and Ariadne" in the

THE UNIVERSITY OF CHICAGO LIBRARY

Sala dell' Anticollégio, painted in 1578. Tintoretto died in 1594, of fever complicated with some internal complaint.

Probably we have a more imperfect idea of the color of Tintoretto than of the other great Venetian painters, owing to his having painted on dark, generally deep-red, grounds, which at the time aided to harmonize the after-painting, but which with age came through and blackened the entire work, affecting most the transparent colors of the shadows and increasing the difference between the solid impasto and the thinner tints. This practice of Tintoretto's is entirely opposed to that of Bellini and Titian, who painted on white or light neutral-gray grounds with a carefully prepared foundation of solid color in the laying in of the subject, and

<sup>1</sup> Boschini, who lived near to the day of Tintoretto and was one of his most enthusiastic admirers, says: "Whenever he had to do a work for the public, he first went to see the place where it was to go, to ascertain the height and the distance, and then, conformably to these, in order to form his conception of the story, he arranged on a table models of figures in wax made by himself, arranging them in groups, serpentine, pyramidal, capricious, eccentric, and animated. . . . When he had

guarded still further against change by leaving the picture to dry thoroughly between paintings, as did Titian, or by painting over a first painting of tempera, as did Bellini. The preparation of Tintoretto's canvas made it possible for him to get through his work with his characteristic rapidity, and was better suited than the orthodox Venetian method to his impatient and unmethodical temperament. The romance of his life is in the story of his daughter, to whom he was much attached, and who died before him. He was buried in the church of S. Maria dell' Orto, where, as his monuments, are the "Last Judgment," the "Worship of the Golden Calf," the "Presentation of the Virgin," and the "Martyrdom of St. Agnes."<sup>1</sup>

W. J. Stillman.

decided this important distribution, he laid in the picture in monochrome (*chiaroscuro*), having always some principal object with reference to which to arrange the general mass. And then he often, having sketched a great canvas, put it in its place to be surer of its suitability; and if he saw something which made discord, he was capable not only of changing a single figure, but even, on account of that, many others around it also, not minding fatigue or time in a question of glory and honor."

#### NOTES BY TIMOTHY COLE.

THE legend of the "Miracle of St. Mark" is as follows: A certain Christian slave in the service of a nobleman of Provence disobeyed the commands of his lord in persisting to worship at the shrine of St. Mark, which was at some distance, and in this practice he spent much of his master's time. One day, on his return from his devotions, he was condemned to the torture; he was haled into the public square, bound hand and foot, and the torture was about to be inflicted, when the saint himself came down from heaven to his aid. His bonds were burst asunder, the instruments of torture were broken, and the executioners were dumfounded and amazed.

The picture hangs in Sala XV, called the "Sala dell' Assunta," of the Academy of Fine Arts at Venice. It is painted on canvas, and measures 13 ft. 8 in. high by 19 ft. 6 in. wide. It would be vain to attempt to give any idea of its richness and glow of color. The sky is green of a mellow tone, grading off into a golden light toward the horizon. The flying robe of the saint is an orange-yellow, burning like an August moon in a sea of green. The portion of the robe about his body is a rich crimson. I invert my opera-glass and gaze at it through the larger end, and the painting, reduced to a miniature, blazes like an array of precious stones. The woman holding the child is a jasper of brownish yellow. The man above, as well as the one clinging

to the pillar, is jet-black. The one standing on the pedestal of the pillar has a ruby vest, very dark and lustrous. The figure kneeling over the slave is of a turquoise-blue. The amber flesh of the slave is relieved against a chocolate-colored ground, or rather pavement. The draperies above are in mingled hues of saffron, blue, gold, and crimson. The Turk holding up the splintered instrument has a creamy-white head-dress figured with blue. His robe is of a soft neutral-greenish tone. The judge, seated on high, is clad in an upper vestment of a deep, rich cardinal. The robe over his knees is yellow, soft, and low in tone. The soldier seated on the step toward the front, with his back turned to the spectator, has a vest of red, bright and of a crimson hue. The shadows are very strong, and have blackened a little with time. The whole, however, is harmonious, glowing, and gem-like, and is painted with great vigor. It is said that there are three portraits of the painter in the body of the work: namely, the figure immediately above the woman holding the child; the one next to the turbaned Turk, with the feather from the apex of his turban; and that in the extreme right of the picture, next to the soldier clad in chain-armor. The portrait of the donor is also to be seen, in the left-hand corner; he is in the attitude of prayer, kneeling at the foot of the column, with eyes closed.

## THE PICTORIAL POSTER.

F "Post no Bills" were the universal law nowadays, those of us who have the good fortune to live in Paris or in New York would be deprived of one of the most interesting manifestations of modern decorative art. Perhaps it is not wholly

the Oriental worker at the loom cannot guess the pleasure we shall take in his subtle commingling of color in the wools of the rug he is weaving. So it is small wonder that the pictorial posters which adorn our blank walls pass unperceived, and that we do not care to observe the skill which has gone to their making. Yet the recent development of the pictorial poster in France and in America is worthy of careful consideration by all who take note of the artistic currents of our time.

unfair to suggest that this nineteenth century of ours is a day of little things, and that our silverware, our pottery, our tiles, our wall-paper, our woodcuts, our book-covers, each in its kind, and when it is at its best, are better than our historic painting, our heroic sculpture, or our grandiose architecture. The minor arts have their place in the hierarchy of the beautiful; and more often than we are willing to acknowledge, they have a charm of their own and a value likely to be as lasting as those of their more pretentious elder sisters. The idyls of Theocritus and the figurines from Tanagra — are these so tiny that we can afford to despise them?

We are all of us prone to underestimate the value of contemporary labor when it is bestowed on common things. Often we fail altogether to see the originality, the elegance, the freshness, — in a word, the *art*, — of the men who are making the things which encompass us roundabout. Possibly the Greek did not consider the beauty of the vase he used daily, the form of which is a pure joy to us; and probably

J. CHÉRET.

From collection of George B. De Forest. (46½ × 67 inches.)

This development has not passed wholly without notice. In 1886 M. Ernest Maindron published in Paris a sumptuously illustrated volume, "Les Affiches Illustrées," in which the history of outdoor advertising among the Greeks and the Romans and the modern French is set forth with the aid of colored engravings. Then there was an exhibition at Nantes in 1889, and one at the Grolier Club here in New York in 1890. Next there was held a special exhibition in 1890 at the gallery of the Théâtre d'Application in Paris, devoted entirely to the extraordinary posters of M. Jules Chéret; and in M. Henri Beraldi's "Graveurs Français du XIX<sup>ème</sup> Siècle," M. Chéret's works were carefully catalogued. Finally, in the fall of 1891, M. Edmond Sagot, a Parisian dealer in prints, issued a priced catalogue of pictorial posters, prepared with conscientious care and serving as an iconography of the art in France. Also to be noted are articles in M. Octave Uzanne's "Livre Moderne" for April and May, 1891, as well as essays on M. Chéret in the "Certains" of M. Huysmans and in the "Figures de Cire" of M.

Hugues Le Roux. A consideration of these scattered publications will lead one to the belief that the pictorial poster, however humble its position, has its place in the temple of art, just as the shop-card has when it is designed by William Hogarth, or the book-plate when it is devised by Albert Dürer.

M. Sagot's priced catalogue is very far from being complete, but it contains more than two thousand numbers, and nearly all these are from Parisian presses. Among the French artists of this century who have designed posters, usually lithographed and mainly placards for the publishers of books or of operas, are the Devérias, Celestin Nanteuil, Tony Johannot, Raffet, Gavarni, Daumier, Cham, Edouard de Beaumont, Viollet-le-Duc, Gustave Doré, Grévin, Manet, and De Neuville; and among contemporary French artists who now and again have made unexpected essays in this department of their craft are M. Vierge, M. Vibert, M. Clairin, M. Boutet de Monvel, M. Regamey, M. Robida, and the Franco-Russian man of genius who calls himself Caran d'Ache. Few of

don" and for his edition of the "Wandering Jew." But for the most part the posters of the painters I have named are muddled and ineffective; they lack the solid simplicity of motive which is the essential of a good advertisement; they are without the bold vigor of design which the poster demands; and they are without the compression and relief of lettering which it requires. These are qualities which the ordinary artist, not seeking, has not achieved, perhaps because he half despised his task. These are the qualities which no one could fail to find in the work of the masters of the poster in France, M. Jules Chéret, M. Willette, M. Grasset. In their advertisements we discover a perfect understanding of the conditions of this form of pictorial art. The first condition is that the poster shall attract attention at all costs; and the second is that it shall satisfy the eye at all hazards. Thus we see that the poster may be noisy,—and noisy it often is, no doubt,—but it must not be violent, just as even a brass band ought ever to play in tune.

In the little group of Frenchmen who are developing the possibilities of a new art, the supremacy of M. Jules Chéret is indisputable. He is the pioneer, and he is also the man of the most marked originality. His is the hand which has covered the walls of Paris with lightly clad female figures, floating in space, and smiling with an explosive joy. He it is who has evoked the fantastic and provocative damsels of the most brilliant gaiety, who invite you to the Red Mill and the Russian Mountains and the other places in Paris where Terpsichore is free and easy. The radiant freshness of these flower-like beauties, and the airy ease of their startling costume, carry us back to Boucher and Moreau. As M. Armand Silvestre has said, "The French taste of Fragonard and of Watteau here lives again in a conception of woman quite as elegant, and quite as deliciously sensual." That the best of M. Chéret's flying nymphs are delicious is beyond question, but that the most of them are sensual, in the lower meaning of the word, I take leave to deny. Gallic bacchantes as many of them seem, they are never lewd, and one might venture to say that they are never without a decorum of their own: they are not immoral, like so many of the delicate indelicacies of Grévin, for example.

the posters of the artists in either of these groups have other than an interest of curiosity, for the designing of pictorial advertisements is an art in itself, a jealous art yielding its favors only to those who study out its secrets with due devotion and persistence. Viollet-le-Duc's sketch of the streets of old Paris is striking; and so are Doré's advertisements for his own "Lon-

M. Chéret is a Frenchman who was brought up as a lithographer. When he was only a lad he went to London, and began to design and put on stone show-cards for Mr. Rimmel, the perfumer. It was Mr. Rimmel's capital which backed him when he returned to Paris nearly a quarter of a century ago, with the intention of producing a new kind of pictorial advertisement. Almost his first attempt was a poster

Some of the keenest critics of Paris have joined in praise of M. Chéret's pictures, though they were merely decorative sketches, doomed to destruction by the first rain-storm, and produced to the order of any chance advertiser who had wares to vend. Some of the most prominent writers on the Parisian newspapers have thanked M. Chéret that he has enlivened the dull gray walls of Paris by lightly draped and merrily dancing figures, giving a suggestion of life and warmth to the wintry streets of the French capital.

These aerial bodies, with their diaphanous drapery and their swift movement, suggest the figures frescoed on the walls of Pompeii; and M. Chéret is not without his share of the Latin ease and *verve* which forever fixed these Pompeian girls as a joy to the world. He has also the bold stroke of the Japanese artist, and he has, moreover, the Japanese faculty of suppressing needless details: for there is never any niggling, any finicky cross-hatching, any uncertainty, in M. Chéret's work. He is an impressionist in one sense of the word—an impres-

sionist who has a masterly command of line and an absolute control of color, and who uses these to make you perceive what has impressed him. The figure he sketches may be as saucy as you please, but there is no slouch about the composition. To describe his work adequately we must needs, as M. Henry Lavedan suggested, borrow from this decorator certain of his own colors, a lemon-yellow, and a geranium-red, and a midnight blue; and even then we should lack the cunning of the artist so to juxtapose these as to reproduce his effects. Almost equally difficult is it to reproduce in a magazine what is most representative in M. Chéret's work; for above all else is he a colorist, and the attempt to translate his work into the

for the Porte Saint Martin fairy play, the "Biche au Bois" (in which Mme. Sara Bernhardt was acting for a season in 1867 while the freak was on her); and since 1867 M. Chéret has produced three or four hundred posters for theaters, circuses, music-halls, charity fêtes, newspapers, and publishers; and he has slowly gained a perfect mastery over his material, until now he can bend to his bidding the stubborn lithographic stone. With the years, and with constant practice, his style has grown firmer, and his pencil has now a larger sweep. With the years, too, has come recognition of his work, and he knows now that what he does is appreciated by those who take thought about the things which surround them.

D. PENEZ.

From collection of Richard Hoe Lawrence. (49½ X 99 inches.)

ous tints; but its emblematic decoration is too ingeniously combined to allow me to pass it over in silence. Even this is less characteristic than his "Librairie Romantique," done in the very spirit of 1830. And it is M. Grasset's stained-glass manner which M. Carloz Schwabe has imitated in his "Salon Rose Croix."

Any one who spends even twenty-four hours in Italy—as it was my good fortune to do a year ago—must observe not a few Italian post-

ers, chiefly railroad advertisements, having a quality of their own, a national note, perhaps best to be characterized as a broad richness of color not unlike that to which we are accustomed in Roman scarfs and Bellagio rugs. In the brilliancy of some of these posters I thought I detected the influence of the little group of Hispano-Roman painters; and I noted also the decorative methods of the lithographic designers who have devised the showy but not inartistic covers for the sheet-music issued by the Milanese publisher, Signor Ricordi. M. Maindron declares that Signor Simonetti, the water-colorist, is to be credited with the elaborate posters announcing the Exposition of Turin some six or seven years ago. Something of this Italian richness is to be found in Spanish bull-fight advertisements.

As to contemporary German work, M. Maindron is silent, as becomes a patriotic Frenchman; but there is little in contemporary German art which should give a patriotic Frenchman a thrill of envy. I have seen no German posters which compare with the finer French work, nor any which have the *brio* and swing of some of the Italian. For the most part the German posters are hard and dull; even when they are learned and scholarly, they are academic and frigid. In the single-sheet bill advertising an exhibition of fans at Karlsruhe in the summer of 1891, there was an ingenious combination of

red and black; and a poster made for the Munich exhibition of the same summer, and representing a stately winged figure of Art advancing solemnly in a chariot drawn by two stalwart steeds, was not without a certain twilight harmony of tone.

British art is as lifeless as Teutonic; the triviality of most of it, and its dominant note of domesticity, are to be observed also in its posters, which are devoted chiefly to things to eat, and to

things to drink, and to things for household use. The brutal vulgarity of a London railway terminus, foul with smoke, is emphasized by the offensive harshness of the posters stuck upon its walls, with no sense of fitness and no attempt at arrangement. *Bariolé* and *criard* are the epithets a French art-critic would inevitably apply to the most of these advertising placards. Oddly enough, the poster is still outside the current of decorative endeavor which has given us the Morris wall-papers, the Doulton tiles, the Walter Crane book-covers, and the Cobden Sanderson bindings. So it happens that one sees in Great Britain but little mural decoration of this sort which is not painfully unpleasant. Even when the advertiser seems to have taken thought and spent money, his effort is misdirected more often than not. Thus a firm of soap-makers has plastered up all over London, and in a printed gilt frame, an elaborate chromolithographic facsimile of an oil-painting by Sir John Millais, called "Bubbles," of which the merits, such as they are, are purely pictorial and in no wise decorative. As a great price was paid for the painting, and as the reproduction was obviously costly, attention was no doubt attracted to the soap-makers, and so the purpose of the advertisement was attained; but no artistic interest was subserved. The same firm of advertisers was far better advised when it procured from Mr. H. Stacy Marks a single black-and-white sketch showing two monks washing themselves with the soap to which attention was to be attracted. Thus it is in Great Britain, in matters of art, good work is ever sporadic. There is no healthy organization and no steady development in England as there is in France; individual posters may be commonplace or distinguished or ugly, as luck will have it; and one suspects that public opinion rather resents than welcomes the stronger effort.

Besides his poster for the soap-maker, Mr. Marks did two of his quaint birds in black and white, for the backs of the sandwichmen who were calling the attention of the public to a collection of his works on exhibition at the Fine Art Society's galleries. For a similar occasion Mr. Walter Crane made one of his delightful decorative designs. For his exhibition of

CARLOZ SCHWABE. From collection of George B. De Forest. (30¼ × 69¼ inches.)

"Life and Work in Bavaria's Alps" at the same gallery, Professor Hubert Herkomer also prepared a poster in black and white. But Professor Herkomer's most ambitious composition is the huge eight-sheet poster he designed in 1881 to announce the starting of the "Magazine of Art." Ten years later Professor Herkomer made another poster, more unpretending, for "Black

and White." These posters of Professor Herkomer were all woodcuts to be printed in black; and so were the posters made by Mr. E. J. Poynter for an insurance company, and the poster made by the late Frederick Walker for the dramatization of the "Woman in White"—a single female figure of dignity and power.

And the American posters of the last generation were all woodcuts. It was in the United States, indeed, that the art of color-printing from a set of pine blocks had been carried to

American circus in Paris during the Exposition of 1867, that opened M. Chéret's eyes to the possibilities of this department of decorative art. Probably again it was an echo of M. Chéret's success in Paris which waked up the American printers, and led to the substitution of the softer lithographic stone for the harsh wood block.

This substitution was made about ten years ago by the Strobridge Company of Cincinnati, a city to which we already owed the ad-

LITHOGRAPHED BY FRIEDRICH GUTSCH, KARLSRUHE.

From collection of Brander Matthews. (28½ × 34½ inches.)

an extreme. This polychromatic printing, of which the circus poster of a dozen years ago was a favorable specimen, was not without a rough effect, although it was hopelessly unattractive when considered seriously. American show-printing revealed much mechanical dexterity, but little or no knowledge of the principles of design, although I can recall more than one of these ruder posters not without merit. The one which I most readily remember advertised Mr. Augustin Daly's drama, "Divorce," and its central figure was a Cupid weeping within a broken wedding-ring. Probably it was the rather startling, and somewhat violent, American posters, hard and dry woodcuts all of them, which proclaimed the advent of an

mirable Rookwood pottery; and the credit of the change is probably due to the late Matt Morgan, an English draftsman of great fertility and abundant fancy. Having caricatured the Prince of Wales in the "Tomahawk," he had come to this country to caricature General Grant in "Frank Leslie's." As a caricaturist he labored under one great disadvantage; he could never draw any but a cockney face; his Irishmen and his negroes, do what he might, were always Englishmen made up for the character: no man may step off his shadow. But Morgan was an accomplished designer with a fine sense for color, as he had shown in England by his scenery for Covent Garden pantomimes. Here in the United States he had come

WALTER CRANE. From collection of Brander Matthews. (13 x 19¾ inches.)

under Japanese influence. So it came about that he and other artists employed by the Strobridge Company, and by the other lithographers who sought to rival the earlier firm, evolved a new style of poster, lithographed like M. Chéret's, effective and picturesque like his, and yet composed according to formulas different from his. In the ten or a dozen years since the first posters were put on stone here in the United States, there has been developed a form of mural decoration wholly unlike anything which existed before—unlike the Parisian, as I have just asserted, and unlike the American woodcut which preceded it and made it possible. The new work is founded on a thorough knowledge of design, of the harmony of color, and of the technical possibilities of the litho-

graphic press. The result is of varying value, of course. It is often commonplace, dull, empty. It is sometimes violent and vulgar. It is frequently beautiful and delightful. There are many purely decorative posters, printed in soft and gentle tones, which are a delight to the eye both in design and in color, and which now give a zest to every chance ramble through the streets of New York. Consider, for example, the striking and suggestive poster "From Chaos to Man," printed by the Springer Company. Consider, again, the "stand of bills" which Mr. H. L. Bridwell devised to announce the coming of the Lillian Russell Opera Comique Company; note the tenderness of the tints and the fastidious grace of the design; and confess that here is a brilliant mural embellishment of a new kind. Akin to this and due to the same firm, the Strobridge Company, were smaller posters for Mr. W. H. Crane and for Mr. Francis Wilson, delightfully decorative in their simple lettering.

"That there is a character in American design which is hardening into style, I think every one who has had much to do with American designers will agree," wrote the lady who is the chief of the Associated Artists, a year or so ago; and Mrs. Wheeler went on to declare that this American style seems to possess three important qualities: "First, absolute fidelity and truth, as shown in Japanese art; second, grace of line, which perhaps comes from familiarity with the forms of the Renaissance; and third, imagination, or individuality of treatment." In its own way the American pictorial poster has felt the influence of this movement forward; and it can be called to bear witness in behalf of Mrs. Wheeler's declaration, just as her own embroideries and textiles can, or the La Farge and Tiffany stained glass, or any other latter-day development of the art instinct of the American people.

## THUMB-NAIL SKETCHES.

"STRANGE TO SAY."

A VAST network of iron rods and girders overhead; long spirals of white steam rising through the gray smoke from a score of locomotives panting and puffing as if impatient to be gone; avenues of railway-carriages in yellow, brown, and black; hurrying, pushing multitudes jostling one another; tired-looking travelers at the end of their journeys; hopeful-looking travelers braving the possibilities of the unknown; luggage-porters, in caps of flaming red and blouses of blue, staggering under Broddingnagian loads; parting messages drowned in the babel of sounds; shrill, warning whistles of departing trains; the clanking of iron wheels on the turn-tables—then,

suddenly, as if by magic, the multitude has vanished. Guards run along the lines of carriages, slamming doors and turning the brass keys. The door of one second-class carriage at the end of the line is open. Into this I pitch my rug and valise, and scramble in after them; the guard slams the door, screams out a hoarse word, and the long train glides out of the Rhijn Spoorweg Station at Rotterdam on its way to Paris.

A person who was curled up in the corner let his feet down upon the floor and helped me to stow my valise in the racks, and, when this preliminary was settled, produced a cigar-case, and inquired in tolerable English if I affected tobacco. We exchanged cigars. His was excellent, while the one from my case was an ordinary three-center that I had purchased in Amsterdam. Still, he did not complain. I could see in the dim light of the winter evening that he was short. He could hardly have been five feet in height, but the feature that most impressed itself upon me was his head, which was entirely out of proportion to his body, and surmounted by a fanciful traveling-cap.

Between the puffs of his cigar, which he consumed furiously, he informed me that he had been in America, in New York, several years before; indeed, he was a great traveler, I fancy, for he had some sort of yarn of half a dozen countries to relate, in his queer English, which was broken with as fully queer French and Italian. He longed for "gompany," he said, and was delighted

that we were to be traveling companions. While he was rather inquisitive, there was nothing in his questions at which one could take offense; indeed, he was quite as amusing as voluble, and all I had to do was to listen quietly, with an occasional "Yes" or "No" for politeness' sake.

Soon, however, his mood changed, and as we were crossing the trestle over the Hollands-Diep he began a sort of sermon upon life, delivered, it seemed to me, in order to show his familiarity with the English tongue, and apropos of nothing. "As t'e eye of t'e morninck to t'e larg, as t'e honey to t'e pee, or as garrison to t'e future, efen such iss life undo t'e heart of mangind." This was profound, but ere long it became also tiresome, as I endeavored to show him politely, by extracting a yellow-covered Tauchnitz of one of Bret Harte's latest stories from my shawl-strap, and burying myself therein—quite a transparent subterfuge, for it had become entirely too dark to read. He had curled his legs up under him, and I fancied and hoped that he might be preparing to go to sleep. He made me nervous with his drone, and with his immense head with the ridiculous cap perched upon it. It seemed as if I could not keep my eyes away from him. We were slowing up at a small station, and finally, with a grinding of the brakes, stopped altogether. There came a pounding noise of feet on the roof of the carriage, a crash, and then a lamp was thrust into its socket overhead, and the footsteps passed on.

My companion looked positively hideous in the dim yellow light of the lamp overhead, which feebly illuminated the carriage. Where I knew his eyes to be were two huge, black patches, from which now and again came a flash, and his cheek-bones stood out with ghastly prominence. As the train gathered momentum his singsong voice rang above the noise of the swiftly moving wheels. "Gomplain nod vith the fool off t'e shordness off dy time. Rememper—" Confound the man! Was I to be annoyed with this sort of thing all the way to Brussels? "Vishest dou to haf an obbtunity off more wices—" I turned in the seat, and, resting my head against the cushioned side, pretended to close my eyes as if to sleep. Of no avail. Still the hissing s's rang upon my senses with maddening reiteration. I fancy that in spite of my nervousness I must have dropped off to sleep for an instant, for a touch awoke me, and, starting to my feet, I found that my companion had moved to the seat exactly opposite my own, and with his hand upon my knee,—a large, bony hand it was, with enlarged joints, and nails bitten to the quick,—had thrust his face forward until it was not more than six inches from my own. He was still chanting his infernal proverbs: "Not life a telusion, a zeries off mizatventures, a bursuit off ewils linked togedder on all sides—" I thrust him away from me with an exclamation of disgust. "In heaven's name, man, what ails you? I wish you would oblige me by stopping your infernal gabble!"

"Softly, friend," he said, leaning back against the cushions. "You are a younk man, and I am an alt man. I haf seen moch off t'e world. T'e t'oughtless man pridleth not his tongue; je speaketh at random; and is gaught in the voolishness off his own vords."

"What do I care what you have seen!" I exclaimed petulantly, now thoroughly exasperated. "Have the goodness to keep to your own end of the carriage, and I will keep to mine."

In a moment I was sorry I had spoken so harshly to the man, and the more I sought to justify my words, the more inexcusable did they become. He had really done nothing at which I could take offense. The garrulousness of age, and the very natural desire to exercise his knowledge of the English language — I began to cast about in my mind for some means with which to soften and undo in a measure that which I now considered my extreme irritability; but, at the same time, I had no desire to stimulate the now happily pent-up flood of proverbs to renewed activity. I gave a sidelong glance toward the corner to which he had retired, and where he sat with his legs drawn up under him, motionless save for a certain nervous activity of his two thumbs, which revolved one over the other. I could not tell whether he was watching me, for his eyes were invisible in the deep shadows made by his overhanging eyebrows.

Upon second thought I determined to let well enough alone, and, lighting my little pocket-lantern, hung it to the hook at my shoulder, and attempted to read; but I was unable to fix my mind upon the story. Over the left-hand corner of the book I held, those long, bony, large-jointed thumbstirelessly, incessantly revolved. Hold the book as I might, I could not drive the impression from my mind. I was forced to count the revolutions of those dreadful thumbs. My mind was fully made up to seek another compartment at the first stop we made. Still the thumbs turned and twisted, their size exaggerated in the light from above. I fell to counting their revolutions, almost unconsciously at first. He seemed to have a system — nine times outward toward me, ten times inward toward himself. Again and again I counted — always the same, with a maddening regularity. On we sped through the night. It was raining now, and huge drops chased one another down the window-pane. The "rackety-tack" of the wheels, the easy swaying of the carriage to the left and then to the right, and the turn and twist of those immense thumbs — I closed the book in despair, and was in the act of thrusting it into the shawl-strap, when with the rapidity of a thunderclap there

came a grinding crash, and the carriage left the track, and, after bumping along over the sleepers, fell upon its side. My companion was thrown upon me.

He grasped me with his long arms, and wound his legs about my body. We were shaken about like pills in a box.

There was an interval of silence,

then the hissing of escaping steam, and shrill screams, all of which I heard in my struggles to escape from

the octopus-like grasp of my companion. At length I succeeded in breaking away, and with a strength incredible and incomprehensible to me now, I forced the door above my head (for the carriage was lying upon its side) just as a number of men came up with lanterns. We soon had the little Frenchman, or whatever he was, out of the wreck, which was not a very bad one, only two carriages having left the track in consequence of a spreading rail. He was quite insensible, but when we got him to the flagman's hut, some distance down the track, he came to himself, and we speedily discovered that he was only a bit shaken up. However, to my extreme embarrassment, he threw himself upon his knees at my feet, hailed me as his deliverer, and called me by many other highfalutin names. His gratitude was boundless, and in vain did I explain to him with all the emphasis at my command that I had done nothing to earn it. He would hear nothing of the sort, waved away my explanations as "motesty," "prafe motesty," and, to my dismay, insisted upon embracing me at intervals.

I will not dwell upon the uncomfortable details of the rest of the journey to Paris. Suffice it, that I was unable to escape from my *bête noire* until I reached the Gare du Nord, where I succeeded in eluding him, it is true, but only

for seven sweet days, after which blessed period he found me, and, embracing me in a paroxysm of joy, took up his lodging in the building where I had my apartment and studio — a huge, rambling brick building in a quarter somewhat frequented by painters.

Then followed a period upon which I look back with a shudder; days when

I kept my studio door (which at intervals resounded with that hated, timid knock) locked and barred even to my best friends, fearing the entrance of my grateful

*bête noire*. I remember the unreasonable shudder of disgust I felt one night when I had gained the court in fancied security, only to meet him coming in the opposite direction, feel the grasp of that horrible hand upon my arm, and hear the hissing s's in my ear. I could not work; it was out of the question. My picture, which I had intended for the Salon, was barely begun. My *bête noire* showered delicacies upon me. The concierge, for example, who did my cooking, would bring me game out of season when I expected a chop, until at last I forbade him to receive the things from "la tête énorme," as he styled him. I fancy the villain lived well in the interval.

Each morning expensive cut flowers were left at my door by the florist, who refused to carry them away, saying that he had been ordered to leave them, and had no further knowledge in the matter. So there they stayed in the hallway, heaped up against the wall as if for a tomb in Père La Chaise, until swept away by the concierge, with semi-pious ejaculations. Can you imagine my position, then, with such unmerited gratitude thrust upon me? Finally I determined to end it all, and wrote to London, asking a friend to look me up quarters, as I would leave Paris at once. Carefully, but with a great show of carelessness, I let the concierge understand that I would attend the opera that evening, in order to cover my outgoing. I intended to take the night train for Boulogne, thence go by boat to Folkestone.

Finally we arrived at Boulogne. The night was a stormy one. Overhead the moon struggled with ragged clouds. It had been raining, for the pavement was wet, and the long lines of yellow gas-lamps were reflected prettily.

There was a rush of the passengers toward the boat, which lay rocking and plunging at the jetty, and when we reached the gang-plank the mail-bags were already being taken aboard, and a huge derrick was creaking and groaning as the deck-hands hoisted some heavy cases over

the side. I hugged myself with delight, thinking that I had escaped from my admirer.

For an instant I fancied I saw the pallid face and shrunken figure of the little old man among the crowd already gathered upon the deck, and I sickened at the thought that my long and tiresome night journey had been endured for naught. Determined to know the worst, I jumped down from the plank to the deck where the face had appeared in the glare of the electric light, only to see it vanish over the companion-ladder leading below to the freight deck. I could not be sure that it was my *bête noire*, but I was bound to follow the figure and to satisfy my fears. Groping my way among the piled-up luggage and boxes, I reached a clear space only to feel strong hands grasp me from behind. I heard a scuffle, the arms were wrenched from about my neck, and, turning, I saw the little old man being forced up the gang-plank to the pier by two muscular-looking fellows. Before I could well collect my senses, the bell clanged noisily, the gang-plank was drawn up, and with increasing speed we left the jetty. I could make out a number of people seemingly struggling with some one under the brightly gleaming electric lights, and I fancied I heard a scream; but in less time than it takes to read this we had passed beyond the end of the jetty, with its final red and green lights, and were on our way across the Channel. In looking over the papers at breakfast one morning several days after my arrival in London, I came upon the following:

#### LUCKY CAPTURE.

On Wednesday night last, as the express-boat from Boulogne for Folkestone was about to leave the jetty, a person of singular aspect was observed by the officers acting in a manner fitted to arouse suspicion. He was seen to scrutinize the faces of the passengers, and finally to follow a gentleman on board the steamer, where he secreted himself in a dark passageway, from which he leaped upon the back of the unsuspecting traveler and attempted to strangle him. Doubtless he would have succeeded in his murderous purpose, but for the vigilance of the "sergeant de ville," who promptly called assistance, and after a severe struggle with the assassin, who seemed to be possessed of herculean strength, succeeded in placing the nippers upon him. Taken before the police, he was unable to give an account of himself, and acted in a very violent manner. It is thought that the author of many mysterious crimes has at length been secured.

LATER.—The individual captured on the Boulogne boat on Wednesday proves to be a certain exalted personage of unsound mind who made his escape from a private "maison de santé" at The Hague. The sergeant de ville has been handsomely rewarded for making the capture of the unfortunate, who, in company with four keepers, left for The Hague this morning.

THE SHOOTING-MATCH.

## A MOUNTAIN EUROPA.

IN TWO PARTS.—PART I.

PICTURES BY E. W. KEMBLE.

AS Clayton rose to his feet in the still air, the tree-tops began to tremble in the gap below him, and a rippling ran through the leaves up the mountain-side. Drawing off his hat, he stretched out his arms to meet it, and his eyes closed with delight as the cool, soft wind struck his throat and face and lifted the hair from his forehead. About him the mountains lay like a tumultuous sea—the Jellico Spur, stilled gradually on every side into vague, purple shapes against the broken rim of the sky, and Pine Mountain and the Cumberland Range racing in like breakers from the north. Beneath him lay Jellico Valley, and just visible in a wooded cove, whence Indian Creek crept into sight, was a mining-camp—a cluster of white cabins—from which he had climbed that afternoon. At that distance the wagon-road narrowed to a bridle-path, and the figure moving slowly along it and entering the forest at the base of the mountain was shrunk to a toy. For a moment Clayton stood with his face to the west, drinking in the air; then tightening his belt, and grasping the pliant

body of a sapling that grew within reach, he swung himself from the rock. His dog, stirred from sleep by the crackling branches, sprang after him. The descent was sharp. At times he was forced to cling to the birch-tops till they lay flat upon the mountain-side.

Breathless, he reached at last a boulder from which the path was easy to the valley below. With quivering muscles he leaned against the soft rug of moss and lichens that covered it. The shadows had crept from the foot of the mountains, darkening the valley, and slowly lifting up the mountain-side beneath him a long, wavering line in which met the cool, deep green of the shade and the shining bronze where the sunlight still lay. Lazily following this line, his gaze rested on two moving shadows that darted long, jagged shapes into the sunlight and as quickly withdrew them. As the road wound up toward him, two figures were vaguely visible through the undergrowth. Presently a head bonneted in blue rose above the bushes, and as they parted for an instant Clayton's half-shut eyes suddenly opened wide and were fixed with a look of amused expectancy where a turn of the path must bring rider and beast into plain sight. Apparently some mountain

girl, wearied by the climb or in a spirit of fun, had mounted her cow while driving it home; and with a smile at the thought of the confusion he would cause her, Clayton stepped around the boulder and awaited their approach. With the slow, easy swing of climbing cattle, the beast brought its rider into view. A bag of meal lay across its shoulders, and behind this the girl—for she was plainly young—sat sidewise, with her bare feet dangling against its flank. Her face was turned toward the valley below, and her loosened bonnet half disclosed a head of bright yellow hair.

Catching sight of Clayton, the beast stopped and lifted its head, not the meek, patient face he expected to see, but a head that was wrinkled and vicious—the head of a bull. Only the sudden remembrance of a dead mountain custom saved him from utter amazement. He had heard that long ago, when beasts of burden were scarce, cows and especially bulls were worked in plows and ridden by the mountaineers, even by the women. But this had become a tradition, the humor of which greater prosperity and contact with a new civilization had taught even the mountain people to appreciate. The necessities of this girl were evidently as great as her fear of ridicule seemed small. When the brute stopped, she began striking him in the flank with her bare heel, without looking around, and as he paid no attention to such painless goading, she turned with sudden impatience and lifted a switch above his shoulders. The stick was arrested in mid-air when she saw Clayton, and then dropped harmlessly. The quick fire in her eyes died suddenly away, and for a moment the two looked at each other with mutual curiosity, but only for a moment. There was something in Clayton's gaze that displeased her. Her face clouded, and she dropped her eyes.

"G' long," she said, in a low tone. But the bull had lowered his head, and was standing with feet planted apart and tail waving uneasily. The girl looked up in alarm.

"Watch out thar!" she called out sharply. "Call thet dog off—quick!"

Clayton turned, but his dog sprang past him and began to bark. The bull, a lean, active, vicious-looking brute, answered with a snort.

"Call him off, I tell ye!" cried the girl, angrily, springing to the ground. "Git out o' ther way. Don't you see he 's a-comin' at ye?"

The dog leaped nimbly into the bushes, and the maddened bull was carried on by his own impetus toward Clayton, who, with a quick spring, landed in safety in a gully below the road. When he picked himself up from the uneven ground where he had fallen, the beast

had disappeared around the boulder. The bag had fallen and had broken open, and some of the meal was spilled on the ground. The girl, flushed and angry, stood above it.

"Look thar, now," she said. "See whut you 've done. Why didn't ye call thet dog off?"

"I could n't," said, Clayton, politely. "He would n't come. I'm sorry, very sorry."

"Can't ye manage yer own dog?" she asked, half contemptuously.

"Not always."

"Then ye oughter leave him ter home, and not let him go round a-skeerin' folks' beastis." With a little gesture of indignation she stooped and began scooping up the meal in her hand.

"Let me help you," said Clayton. The girl looked up in surprise.

"Go 'way," she said.

But Clayton stayed, watching her helplessly. He wanted to carry the bag for her, but she swung it to her shoulder, and moved away. He followed her around the boulder, where his late enemy was browsing peacefully on sassafras-bushes.

"You stay thar," said the girl, "and keep thet dog back."

"Won't you let me help you get up?" he asked.

Without answering, the girl sprang lightly to the bull's back. Once only she looked around at him. He took off his hat, and a puzzled expression came into her face. Then without a word or a nod she rode away. Clayton watched the odd pair till the bushes hid them.

"Well," he thought, as he sat down upon a stone in bewilderment, "if that kind of girl was partial to bull-riding in mythological days, I don't know that I envy the old furioso of Olympus when he carried off Europa."

She seemed a very odd creature, singularly different from the timid mountain women who shrank with averted faces almost into the bushes when he met them. She had looked him straight in the face with steady eyes, and had spoken as though her sway over mountain and road were undisputed and he had been a wretched trespasser. She had paid no attention to his apologies, and had scorned his offers of assistance. She seemed no more angered by the loss of the meal than by his incapacity to manage his dog, which seemed to typify to her his general worthlessness. He had been bruised severely by his fall, and she did not even ask if he were hurt. Indeed, she seemed not to care, and she had ridden away from him as though he were worth no more consideration than the stone on which he rested.

He was amused, and a trifle irritated. How could there be such a curious growth in the mountains, he questioned, as he rose and con-

tinued the descent? There was an unusual grace about her, in spite of her masculine air. Her features were regular, almost classic in outline, the nose straight and delicate, the mouth resolute, the brow broad and intelligent, and the eyes intensely blue,—tender, perhaps, when not flashing with anger,—and altogether without the listless expression he had marked in all other mountain women, and which, he had noticed, deadened into pathetic hopelessness later in life. Her figure was erect and lithe, and her imperious manner, despite its roughness, savored of something high-born. Where could she have got that bearing? She belonged to a race whose descent, he knew, was unmixed English; upon whose lips still lingered words, phrases, and forms of speech that Shakspeare had heard and used. Who could tell what blood ran in her veins?

Musing, he had come almost unconsciously to a spur of the mountains beneath which lay the little mining-camp. It was six o'clock, and the miners, grim and black, each with a pail in hand and a little oil-lamp in his cap, were going down from work. A shower had passed over the mountains above him, and the last sunlight, coming through a gap in the west, struck the rising mist and turned it to gold. On a rock which thrust from the mountain its gray, somber face, half-embraced by a white arm of the mist, Clayton saw the figure of a woman. He waved his hat, but the figure stood motionless, and he turned into the woods toward the camp.

It was the girl, and when Clayton disappeared she too turned and continued her way. She had stopped there because she knew he must pass a point where she might see him again. She was little less indifferent than she seemed; her motive was little more than curiosity. She had never seen that manner of man before. Evidently he was a "furriner," she thought, from the "settlemints." No man in the mountains had a smooth, round face like his, or wore such a queer hat, such a soft, white shirt, and no "galluses," or carried such a shiny, weak-looking stick, or owned a dog that he could n't make mind him. She was not wholly contemptuous, however. She had felt vaguely the meaning of his politeness and deference. She was puzzled and pleased, she scarcely knew why.

"He was mighty accommodatin'," she thought. "But whut," she asked herself, as she rode slowly homeward—"whut did he take off his hat fer?"

## II.

LIGHTS twinkled from every cabin as Clayton passed through the camp. Outside the kitchen doors, miners, bare to the waist, were

bathing their blackened faces and bodies, with children, tattered and unclean, but healthful, playing about them; within, women in loose gowns, with sleeves uprolled and with disordered hair, moved like phantoms through clouds of savory smoke. The commissary was brilliantly lighted. At a window close by improvident miners were drawing the wages of the day, while their wives waited in the store with baskets unfiled. In front of the commissary a crowd of negroes were talking, laughing, singing, and playing pranks like children. Here two, with grinning faces, were squared off, not to spar, but to knock at each other's tattered hat; there two more, with legs and arms indistinguishable, were wrestling; close by was the sound of a mouth-harp, a circle of interested spectators, and, within, two dancers pitted against each other, and shuffling with a zest that labor seemed never to affect.

Immediately after supper Clayton went to his room, lighted his lamp, and sat down to a map he was tracing. His room was next the ground, and a path ran near the open window. As he worked, every passer-by paused a moment to look curiously within. On the wall above his head a pair of fencing-foils were crossed beneath masks. Below these hung two pistols, such as courteous Claude Duval used for side-arms. Opposite were two old rifles, and beneath them two stone beer-mugs, and a German student's pipe absurdly long and richly ornamented. A mantel close by was filled with curiosities, and near it hung a banjo unstrung, a tennis-racket, and a blazer of startling colors. Plainly they were relics of German student life, and the odd contrast they made with the rough wall and ceiling suggested a sharp change in the fortunes of the young worker beneath. Scarcely six months since he had been suddenly summoned home from Germany. The reason was vague, but having read of recent American failures, notably in Wall street, he knew what had happened. Reaching New York, he was startled for an instant by the fear that his mother was dead, so gloomy was the house, so subdued his sister's greeting, and so worn and sad his father's face. The trouble, however, was what he had guessed, and he had accepted it with quiet resignation. The financial wreck seemed complete; but one resource, however, was left. Just after the war Clayton's father had purchased mineral lands in the South, and it was with the idea of developing these that he had encouraged the marked scientific tastes of his son, and had sent him to a German university. In view of his own disaster and the fact that a financial tide was swelling southward, his forethought seemed almost an inspiration. To this resource Clayton turned eagerly; and after a few weeks at home, which were made

intolerable by straitened circumstances, and the fancied coldness of friend and acquaintance, he was hard at work in the heart of the Kentucky mountains.

The transition from the careless life of a student was swift and bitter; it was like beginning a new life with a new identity, though Clayton suffered less than he anticipated. He had become interested from the first. There was nothing in the pretty glen, when he came, but a mountaineer's cabin and a few gnarled old apple-trees, the roots of which checked the musical flow of a little stream. Then the air was filled with the tense ring of hammer and saw, the mellow echoes of axes, and the shouts of ox-drivers from the forests, indignant groans from the mountains, and suddenly a little town sprang up before his eyes, and cars of shining coal wound slowly about the mountain-side.

Activity like this stirred his blood. Busy from dawn to dark, he had no time to grow miserable. His work was hard, to be sure, but it made rest and sleep a luxury, and it had the new zest of independence; he even began to take in it no little pride when he found himself an essential part of the quick growth going on. When leisure came, he could take to woods filled with unknown birds, new forms of insect life, and strange plants and flowers. With every day, too, he was more deeply stirred by the changing beauty of the mountains—hidden at dawn with white mists, faintly veiled through the day with an atmosphere that made him think of Italy, and enriched by sunsets of startling beauty. But strongest of all was the interest he found in the odd human mixture about him—the simple, good-natured darkies who slouched past him, magnificent in physique and picturesque with rags; occasional foreigners just from Castle Garden, with the hope of the New World still in their faces; and now and then a gaunt mountaineer stalking awkwardly in the rear of this march toward civilization. Gradually it had dawned upon him that this last, silent figure, traced through Virginia, was closely linked by blood and speech with the common people of England, and, molded perhaps by the influences of feudalism, was still strikingly unchanged; that now it was the most distinctively national remnant on American soil, and symbolized the development of the continent; and that with it must go the last suggestions of the pioneers, with their hardy physiques, their speech, their manners and customs, their simple architecture and simple mode of life. It was soon plain to him, too, that a change was being wrought at last—the change of destruction. The older mountaineers, whose bewildered eyes watched the noisy signs of an unintelligible civilization, were passing away. Of the rest, some, sullen and restless,

were selling their homesteads and following the spirit of their forefathers into a new wilderness; others, leaving their small farms in adjacent valleys to go to ruin, were gaping idly about the public works, caught up only too easily by the vicious current of the incoming tide. In a century the mountaineers must be swept away, and their ignorance of the tragic forces at work among them gave them an unconscious pathos that touched Clayton deeply.

As he grew to know them, their historical importance yielded to a genuine interest in the people themselves. They were densely ignorant, to be sure; but they were natural, simple, and hospitable. Their sense of personal worth was high, and their democracy—*or* aristocracy, since there was no distinction of caste—absolute. For generations son had lived like father in an isolation hardly credible. No influence save such as shook the nation ever reached them. The Mexican war, slavery, and national politics of the first half-century were still present issues, and each old man would give his rigid, individual opinion sometimes with surprising humor and force. He went much among them, and the rugged old couples whom he found in the cabin porches—so much alike at first—quickly became distinct with a quaint individuality. Among young or old, however, he had found nothing like the half-wild young creature he had met on the mountain that day. In her a type had crossed his path—had driven him from it, in truth—that seemed unique and inexplicable. He had been little more than amused at first, but a keen interest had been growing in him with every thought of her, and to-night, as he laid aside his pencil, the incidents of the encounter on the mountain came minutely back to him till he saw her again as she rode away, her supple figure swaying with every movement of the beast, and dappled with quivering circles of sunlight from the bushes, her face calm, but still flushed with color, and her yellow hair shaking about her shoulders—not lusterless and flaxen, as hair was in the mountains, he remembered, but catching the sunlight like gold. There was an undefinable charm about the girl. She gave a new and sudden zest to his interest in mountain life. She filled a lack unnoticed before, and he made up his mind to see her again as soon as possible.

As he leaned almost unconsciously from his window to lift his eyes to the dark mountain he had climbed that day, the rude melody of an old-fashioned hymn came faintly up the glen, and he recognized the thin, quavering voice of an old mountaineer, Uncle Tommy Brooks, as he was familiarly known, whose cabin stood in the midst of the camp, a pathetic contrast to the smart new houses that had sprung up around it. The old man had lived in the glen

for nearly three quarters of a century, and he, if any one, must know the girl. With the thought, Clayton sprang through the window, and a few minutes later was at the cabin. The old man sat whittling in the porch, joining in the song with which his wife was crooning a child to sleep within. Clayton easily identified Europa, as he had christened her; the simple mention of her means of transport was sufficient.

"Ridin' a bull, was she?" repeated the old man, laughing. "Well, that was Easter Hicks, old Bill Hicks's gal. She 's a sort o' connection o' mine. Me and Bill married cousins. She 's a cur'us critter ez ever I seed. She don' seem ter take atter her dad nur her mammy nuther, though Bill allus hed a quar streak in 'im, and was the wust man I ever seed when he was disguised by licker. Whar does she live? Oh, up thar, right on top o' Wolf Mountain, with her mammy."

"Alone?"

"Yes; fer her dad ain't thar. No; 'n' he ain't dead. I 'll tell ye,"—the old man lowered his tone,—“thar used ter be a big lot o' moonshinin' done in these parts, 'n' a' off'cer came in hyar ter see 'bout it. Well, one mornin' he was found layin' in the road with a bullet through him. Bill was s'pected. I ain't a-sayin' ez Bill did it, but when a whole lot more rode up thar on horses one night, they did n't find Bill. They hain't found him yit, fer he 's out in the mountains somewhar a-hidin'."

"How do they get along without him?" asked Clayton.

"Why, ther gal does the work. She plows with that bull, and does the plantin' herself. She kin chop wood like a man. 'N' ez fer shootin', well, when huntin' 's good 'n' thar 's shootin'-matches roundabout, she don't hev ter buy much meat."

"It 's a wonder some young fellow has n't married her. I suppose, though, she 's too young."

The old man laughed. "Thar 's been many a lively young feller thet 's tried it, but she 's ez hard to ketch ez a wildcat. She won't hev nuthin' to do with other folks, 'n' she never comes down hyar inter the valley, 'cept ter git her corn ground er ter shoot er turkey. Sherd Raines goes up ter see her, and folks say he air tryin' ter git her inter the church. But the gal won't go nigh a meetin'-house. She air a cur'us critter," he concluded emphatically, "shy ez er deer till she air stirred up, then she air a caution; mighty gentle sometimes, and ag'in ez stubborn ez a mule."

A shrill infantile scream came from within, and the old man paused a moment to listen.

"Ye did n't know I hed a great-grandchild, did ye? Thet 's it a-hollerin'. Talk about Easter bein' too young to merry! Why, hits mother

air two year younger 'n Easter. Come in and take a peep." The old mountaineer rose and led the way into the cabin. Clayton was embarrassed at first. On one bed lay a rather comely young woman with a child by her side; on a chest close by sat another with her lover, courting in the most open and primitive manner. In the corner an old granddam dozed with her pipe, her withered face just touched by the rim of the firelight. Near a rectangular hole in the wall which served the purpose of a window stood a girl whose face, silhouetted against the darkness, had in it a curious mixture of childishness and maturity.

"Whar 's ther baby?" asked Uncle Tommy.

Somebody outside was admiring it, and the young girl leaned through the window and lifted the infant within.

"Thar 's a baby fer ye!" exclaimed the old mountaineer, proudly, lifting it in the air and turning its face to the light. But the child was peevish and fretful, and he handed it back gently. Clayton was wondering which was the mother, when, to his amazement, almost to his confusion, the girl lifted the child calmly to her own breast. The child was the mother of the child. She was barely fifteen, with the face of a girl of twelve, and her motherly manner had struck him as an odd contrast. He felt a thrill of pity for the young mother as he called to mind the aged young wives he had seen who were haggard and careworn at thirty, and who still managed to live to an old age. He was indefinitely glad that Easter had escaped such a fate. When he left the cabin, the old man called after him from the door:

"Thar 's goin' ter be a shootin'-match among the boys ter-morrer, 'n' I jedge that Easter will be on hand. She allus is."

"Is that so?" said Clayton. "Well, I 'll look out for it."

The old mountaineer lowered his voice.

"Ye hain't thinkin' about takin' er wife, air ye?"

"No, no!"

"Well, ef ye air," said the old man, slowly, "I 'm a-thinkin' ye 'll hev ter buck up ag'in' Sherd Raines, fer ef I hain't like a goose a-pickin' o' grass by moonshine, Sherd air atter the gal fer hisself, not fer the Lord. Yes," he continued, after a short, dry laugh; "'n' mebbe ye 'll hev ter keep an eye open fer old Bill. They say thet he air mighty low down, 'n' kind o' sorry 'n' skeary, fer I reckon Sherd Raines hev told him he hev got ter pay the penalty fer takin' a human life; but I would n't sot much on his bein' sorry ef he was mad at me and hed licker in him. He hates furriners, and he has a crazy idee thet they is all off'cers 'n' lookin' fer him."

"I don't think I 'll bother him," said Clay-

ton, turning away with a laugh. "Good night!" With a little cackle of incredulity, the old man closed the door. The camp had sunk now to perfect quietude; but for the faint notes of a banjo far up the glen, not a sound trembled on the night air.

The rim of the moon was just visible above the mountain on which Easter — what a pretty name that was! — had flashed upon his vision with such theatric effect. As its brilliant light came slowly down the dark mountain-side, the mists seemed to loosen their white arms, and to creep away like ghosts mistaking the light for dawn. With the base of the mountain in dense shadow, its crest, uplifted through the vapors, seemed poised in the air at a startling height. Yet it was near the crest that he had met her. Clayton paused a moment, when he reached his door, to look again. Where in that cloud-land could she live? he wondered.

### III.

As the great bell struck the hour of the next noon, mountaineers with long rifles across their shoulders were already moving through the camp. The glen opened into a valley, which, blocked on the east by Pine Mountain, was thus shut in on every side by wooded heights. Here the marksmen were gathered. All were mountaineers, lank, bearded men, coatless for the most part, and dressed in brown home-made jeans, slouched, formless hats, and high, coarse boots. Sun and wind had tanned their faces to sympathy, in color, with their clothes, which had the dun look of the soil. They seemed peculiarly a race of the soil, to have sprung as they were from the earth, which had left indelible stains upon them. All carried long rifles, old-fashioned and home-made, some even with flint-locks. It was Saturday, and many of their wives had accompanied them to the camp. These stood near, huddled into a listless group, with their faces half hidden in check bonnets of various colors. A barbaric love of color was apparent in bonnet, shawl, and gown, and surprisingly in contrast with such crudeness of taste was a face when fully seen, so modest was it. The features were always delicately wrought, and softened sometimes by a look of patient suffering almost into refinement.

On the other side of the contestants were the people of the camp, a few miners with pipes lounging on the ground, and women and girls, who returned the furtive glances of the mountain women with stares of curiosity and low laughter.

Clayton had been delayed by his work, and the match was already going on when he reached the grounds.

"Ye hev missed some mighty fine shootin',"

said Uncle Tommy Brooks, who was squatted on the ground near the group of marksmen. "Sherd's been a-beatin' everybody. I'm afeard Easter hain't a-comin'. The match air almost over now. Ef she 'd been here, I don't think Sherd would 'a' got the ch'ice parts o' that beef so easy."

"Which is he?" asked Clayton.

"Thet tall feller thar loadin' his gun."

"What did you say his name was?"

"Sherd Raines, the feller thet 's goin' ter be our circuit-rider."

He remembered the peculiar name. So this was Easter's lover. Clayton looked at the young mountaineer, curiously at first and then with growing interest. His quiet air of authority among his fellows was like a birthright; it seemed assumed and accepted unconsciously. His face was smooth, and he was fuller in figure than the rest, but still sinewy and lank, though not awkward; his movements were too quick and decisive for that. With a casual glance Clayton had wondered what secret influence could have turned to spiritual things a man so merely animal-like in face and physique; but when the mountaineer thrust back his hat, an elemental strength and a seriousness of character were apparent in the broad, square brow, the steady, fearless glow of the eye, a certain poise of the head, and in lines around the strong mouth and chin in which the struggle for self-mastery had been traced.

As the mountaineer thrust his ramrod back into its casing, he glanced at the woods behind Clayton, and said something to his companions. They, too, raised their eyes, and at the same moment the old mountaineer plucked Clayton by the sleeve.

"Thar comes Easter now."

The girl had just emerged from the edge of the forest, and with a rifle on one shoulder and a bullet-pouch and powder-horn swung from the other, was slowly descending the path.

"Why, how air ye, Easter?" cried the old man, heartily, as she approached. "Goin' ter shoot, air ye? I 'lowed ye would n't miss this. Ye air mighty late, though."

"Oh, I only wanted er turkey," said the girl.

"Well, I'm a-comin' up ter eat dinner with ye ter-morrer," he answered, with a laugh, "fer I know ye 'll git one. Ye air on hand fer most o' the matches now. *Wild* turkeys must be a-gittin' skase."

The girl smiled, showing a row of brilliant white teeth between her thin, red lips, and, without answering, moved toward the group of mountain women. Clayton had raised his hand to his hat when the old man addressed her, but he dropped it quickly to his side in no little embarrassment when the girl carelessly glanced over him with no sign of recognition. Her rifle

was an old flint-lock of light build, but nearly six feet in length, with a shade of rusty tin two feet long fastened to the barrel to prevent the sunlight from affecting the marksman's aim. She wore a man's hat, which, with unintentional coquetry, was perched on one side of her head. Her hair was short, and fell as it pleased about her neck. She was barefooted, and apparently clad in a single garment, a blue homespun gown, gathered loosely at her uncorseted waist, and showing the outline of the bust and every movement of the tall, supple form beneath. Her appearance had quickened the interest of the spectators, and apparently was a disturbing influence among the contestants, who were gathered together, evidently in dispute. From their glances Clayton saw that Easter was the subject of it.

"I guess they don't want her ter shoot — them thet hain't won anything," said Uncle Tommy.

"She hev come in late," Clayton heard one say, "'n' she ought n' ter shoot. Thar hain't no chance shootin' agi'n' her anyway, 'n' I 'm in favor o' barrin' her out."

"Oh, no; let her shoot," — the voice was Raines's. "Thar hain't nuthin' but a few turkeys left, 'n' ye 'd better bar out the gun 'stid o' the gal, anyway, fer thet gun kin outshoot anything in the mountains."

The girl had been silently watching the group as if puzzled by their actions, and when Raines spoke, her face tightened with sudden decision, and she strode swiftly toward them in time to overhear the young mountaineer's last words.

"So hit 's the gun, is hit, Sherd Raines?" The crowd turned, and Raines shrank a little as the girl faced him with flashing eyes. "So hit 's the gun, is hit? Hit *is* a good gun, but ye ought ter be ashamed ter take all the credit 'way from me. But ef you air so *certain* hit 's the gun," she continued, "I 'll shoot yourn, 'n' ye kin hev mine ef I don't beat ye with yer own gun."

"Good fer you, Easter!" shouted the old mountaineer.

Raines had recovered himself, and was looking at the girl seriously. Several of his companions urged him aloud to accept the challenge, but he paid no heed to them. He seemed to be debating the question with himself, and a moment later he said quietly:

"'N' you kin hev mine ef I don't beat you."

This was all he said, but he kept his eyes fixed on the girl's face; and when, with a defiant glance, she turned toward the mountain women, he followed and stopped her.

"Easter," Clayton heard him say in a low, slow voice, "I was tryin' ter git ye a chance ter shoot, fer ye hev been winnin' so much thet

it 's hard to git up a match when ye air in it." The hard look on the girl's face remained unchanged, and the mountaineer continued firmly:

"'N' I told the truth; fer ef ye pin me down, I think hit is the gun."

"Jes you wait 'n' see," answered the girl, shortly, and Raines, after a questioning look, rejoined the group.

"I won't take the gun ef I win it," he said to them; "but she air gittin' too set up 'n' proud, 'n' I 'm goin' ter do my best ter take her down a bit."

There was nothing boastful or malicious in his manner or speech. He had taken the task of subduing the girl's pride from a sense of duty, and nobody doubted that he would do it, for there were few marksmen in the mountains his equal, and he would have the advantage of using his own gun.

"Look hyar," said a long, thin mountaineer, coming up to the group, "thar ain't but one turkey left, 'n' I 'd like ter know what we air ter shoot at ef Sherd 'n' Easter gits a crack at him."

In the interest of the match no one had thought of that, and a moment of debate followed, which Clayton ended by stepping forward.

"I 'll furnish a turkey for the rest of you," he said.

The girl turned when he spoke and gave him a quick glance, but averted her eyes instantly.

Clayton's offer was accepted, and the preliminary trial to decide who should shoot first at the turkey was begun. Every detail was watched with increasing interest. A piece of white paper marked with two concentric circles was placed sixty yards away, and Raines won with a bullet in the inner circle. The girl had missed both, and the mountaineer offered her two more shots to accustom herself to the gun. She accepted, and smiled a little triumphantly as she touched the outer circle with one bullet and placed the other almost in the center. It was plain that the two were evenly matched, and several shouts of approval came from the crowd. The turkey was hobbled to a stake at the same distance, and both were to fire at its head, with the privilege of shooting at fifty yards if no rest were taken.

Raines shot first without rest, and, as he missed, the girl followed his example. The turkey dozed on in the sunlight, undisturbed by either. The mountaineer was vexed. With his powerful face set determinedly, he lay down flat on the ground, and, resting his rifle over a small log, took an inordinately long and careful aim. The rifle cracked, the turkey bobbed its head unhurt, and the marksman sprang to his feet with an exclamation of surprise and chagrin.

As he loaded the gun and gravely handed it to the girl, the excitement grew intense. The crowd pressed close. The stolid faces of the mountain women, thrust from their bonnets, became almost eager with interest. Raines, quiet and composed as he was, looked anxious. All eyes followed every movement of the girl as she coolly stretched her long, active figure on the ground, drew her dress close about her straight, strong limbs, and, throwing her yellow hair over her face to shade her eyes from the slanting sunlight, placed her cheek against the stock of the gun. A long suspense followed. A hush almost of solemnity fell upon the crowd.

"Why don't the gal shoot?" asked a voice impatiently.

Clayton saw what the matter was, and, stepping toward her, said quietly, "You forgot to set the trigger."

The girl's face colored. Again her eye glanced along the barrel, a puff of smoke flew from the gun, and a shout came from every pair of lips as the turkey leaped into the air, and fell beating the ground with its wings. In an instant a young mountaineer had rushed forward and seized it, and, after a glance, dropped it with a yell of triumph.

"Shot plum' through the eyes!" he shouted, "Shot plum' through the eyes!"

The girl arose, and handed the gun back to Raines.

"Keep hit," he said steadily. "Hit 's yourn."

"I don't want the gun," she said, "but I did want that turkey—'n'" — a little tauntingly — "I did want to beat you, Sherd Raines."

The mountaineer's face flushed and darkened, but he said nothing. He took no part in the shooting that followed, and when, after the match was over, the girl, with her rifle on one shoulder and the turkey over the other, turned up the mountain path, Clayton saw him follow her.

#### IV.

A FORTNIGHT later Clayton, with rifle in hand, took the same path. It was late in May. The leafage was luxuriant, and the mountains, wooded to the tops, seemed overspread with great, shaggy rugs of green. The woods were resonant with song-birds, and the dew dripped and sparkled wherever a shaft of sunlight pierced the thick leaves. Late violets hid shyly beneath canopies of May-apple; bunches of blue and of white anemone nodded from beneath fallen trees, and water ran like hidden music everywhere. Slowly the valley and the sounds of its life—the lowing of cattle, the clatter at the mines, the songs of the negroes at work—sank beneath him. The chorus of

birds dwindled until only the cool, flute-like notes of a wood-thrush rose faintly from below. Up he went, winding around great oaks, fallen trunks, loose boulders, and threatening cliffs until light glimmered whitely between the boles of the trees. From a gap where he paused to rest a bare spot was visible close to the crest of the adjoining mountain. It was filled with the charred, ghost-like trunks of trees that had been burned standing. If a cultivated field, Clayton thought, Easter's home must be near that; and he turned toward it by a path that ran along the top of the mountain. After a few hundred yards the path swerved sharply through a dense thicket, and Clayton stopped in wonder at the scene before him.

Some natural agent had hollowed the mountain, leaving a level plateau of several acres. The earth had fallen away from a great somber cliff of solid rock, and clinging like a swallow's nest in a cleft of this was the usual rude cabin of a mountaineer. The face of the rock was dark with vines, and the cabin was protected as by a fortress. But one way of approach was possible, and that straight to the porch. From the cliff the vines had crept to roof and chimney, and were waving their tendrils about a thin, blue spiral of smoke. The cabin was gray and tottering with age. Above the porch the branches of an apple-tree hung leaves that matched in richness of tint the thick moss on the rough shingles. Beneath it an old woman sat spinning, and a hound lay asleep at her feet. Easter was nowhere to be seen, but her voice came from below him in a loud tone of command; and presently she appeared from behind a knoll, above which the thatched roof of a stable was visible, and slowly ascended the path to the house. She had evidently just finished work, for a plow stood in the last furrow of the field, and the fragrance of freshly turned earth was in the air. On the porch she sank wearily into a low chair, and, folding her hands, looked away to the mountains.

Pausing but a moment, Clayton climbed the crumbling fence. As he sprang to the ground a dead twig snapped, and, startled by the sound, the girl began to rise; but, giving him one quick, sharp look, dropped her eyes to her hands, and remained motionless.

"Good morning," said Clayton, lifting his hat. The girl did not raise her face. The wheel stopped, and the spinner turned her head.

"How air ye?" she said, with ready hospitality. "Come in an' hev a cheer."

"No, thank you," he answered, a little embarrassed by Easter's odd behavior. "May I get some water?"

"Sartinly," said the old woman, looking him over curiously. "Easter, go git some fresh."

The girl started to rise, but Clayton, picking up the bucket, said quickly:

"Oh, no; I won't trouble you. I see the spring," he added, noticing a tiny stream that trickled from a fissure at the base of the cliff.

"Who air thet feller, Easter?" the mother asked in a low voice, when Clayton was out of hearing.

"One o' them furriners who hev come into Injun Creek," was the indifferent reply.

"That 's splendid water," said Clayton, returning. "May I give you some?" The old woman shook her head. Easter's eyes were still on the mountains, and apparently she had not heard him.

"Hit air good water," said the mother. "The spring never does go dry. You better come in and rest a spell. I suppose ye air from the mines?" she added, as she turned to resume spinning.

"Yes," answered Clayton; and feeling that some explanation was due for his sudden arrival away up in that lone spot, he continued:

"There is good hunting around here, is n't there?"

There was no answer. Easter did not look toward him, and the spinning stopped.

"Whut did you say?" asked the old woman.

Clayton repeated his question.

"Thar used ter be prime huntin' in these parts when my dad cleared off this spot more 'n fifty year ago, but the varmints hev mostly been killed out. But Easter kin tell you better 'n I kin, for she does all our huntin', 'n' she kin outshoot 'mos' any man in the mountains."

"Yes; I saw her shoot at the match the other day down at the mines."

"Did ye?"—a smile of pleasure broke over the old woman's face—"whar she beat Sherd Raines? Sherd wanted to mortify *her*, but she mortified *him*, I guess."

The girl did not join in her mother's laugh, though the corners of her mouth twitched faintly.

"I like shooting, myself," said Clayton. "I would go into a match; but I 'm afraid I would n't have much chance."

"I reckon not, with thet short thing?" said the old woman, pointing at his repeating-rifle. "Would ye shoot with thet?"

"Oh, yes," answered Clayton, smiling; "it shoots very well."

"How fer?"

"Oh, a long way."

A huge shadow swept over the house, thrown by a buzzard sailing with magnificent ease high above them. Thinking that he might disturb its flight, Clayton rose and cocked his rifle.

"Ye 're not goin' to shoot at thet?" said the old woman, grinning. The girl had looked toward him at last, with a smile of faint derision.

Clayton took aim quickly and fired. The huge bird sank as though hit, curved downward, and with one flap of his great wings sailed on.

"Well, ef I did n't think ye hed hit him!" said the old woman, in amazement. "Ye kin shoot, fer a fac'."

Easter's attention was gained at last. For the first time she looked straight at him, and her little smile of derision had given way to a look of mingled curiosity and respect.

"I expected only to scare him," said Clayton. "The gun will carry twice that far."

"Hit 's jest ez well ye did n't hit him," said the old woman. "Hit air five dollars fine to kill a buzzard around here. I'd never thought thet little thing could shoot."

"It shoots several times," said Clayton.

"Hit does whut?"

"Like a pistol," he explained, and, rising, he directed several shots in quick succession at a dead tree in the plowed field. At each shot a puff of dust came almost from the same spot.

When he turned, Easter had risen to her feet in astonishment, and the mother was laughing long and loudly.

"Don't ye wish ye hed a gun like thet, Easter?" she cried.

Clayton turned quickly to the girl, and began explaining the mechanism of the gun to her, without appearing to notice her embarrassment, for she shrank perceptibly when he spoke to her.

"Won't you let me see your gun?" he asked.

She brought out the old flint-lock, and handed it to him almost timidly.

"This is very interesting," he said. "I never saw one like it before."

"Thar hain't but one more jest like thet in the mountains," said the old woman, "'n' Easter's got that. My dad made 'em both."

"How would you like to trade one for mine, if you have two?" said Clayton to the girl. "I 'll give you all my cartridges to boot."

The girl looked at her mother with hesitation. Clayton saw that both wondered what he could want with the gun, and he added:

"I 'd like to have it to take home with me. It would be a great curiosity."

"Well," said the mother, "ye kin hev one ef ye want hit, and think the trade 's fa'r."

Clayton insisted, and the trade was made. The old woman resumed spinning. The girl took her seat in the low chair, holding her new treasure in her lap, with her eyes fixed on it, and occasionally running one brown hand down its shining barrel. Clayton watched her. She had given no sign whatever that she had ever seen him before, and yet a curious change

had come over her. Her imperious manner had yielded to a singular reserve and timidity. The peculiar beauty of the girl struck him now with unusual force. Her profile was remarkably regular and delicate; her mouth small, resolute, and sensitive; heavy, dark lashes shaded her downcast eyes; and her brow suggested a mentality that he felt a strong desire to test. Her feet were small, and so were her quick, nervous hands, which were still finely shaped, in spite of the hard usage that had left them brown and callous. He wondered if she were really as beautiful as she seemed; if his standard might not have been affected by his long stay in the mountains; if her picturesque environment might not have influenced his judgment. He tried to imagine her daintily slippered, clad in white, with her loose hair gathered in a Psyche knot; or in evening dress, with arms and throat bare: but the pictures were difficult to make. He liked her best as she was, in perfect physical sympathy with the natural phases about her, as much a part of them as tree, plant, or flower, embodying the freedom, grace, and beauty of nature as well and as unconsciously as they. He questioned whether she had ever felt herself to be apart from them, and he wondered if there might be in her a recognition of her kinship to them.

She had lifted her eyes now, and had fixed them with tender thoughtfulness on the mountains. What did she see in the scene before her, he wondered: the deep valley, brilliant with early sunshine; the magnificent sweep of wooded slopes; Pine Mountain and the peak-like Narrows, where through it the river had worn its patient way; and the Cumberland Range, lying like a cloud against the horizon, and bluer and softer than the sky above it. He longed to know what her thoughts were; if in them there might be a hint of what he hoped to find. Probably she could not tell them, should he ask her, so unconscious was she of her mental life, whatever that might be. Indeed, she seemed scarcely to know of her own existence; there was about her a simplicity to which he had felt himself rise only in the presence of the spirit about some lonely mountaintop or in the heart of deep woods. Her gaze was not vacant, not listless, but the pensive look of a sensitive child, and Clayton fancied there was in it an unconscious love of the beauty before her, and of its spiritual suggestiveness a slumbering sense, perhaps easily awakened. Perhaps he might awaken it.

The drowsy hum of the spinning-wheel ceased suddenly, and his dream was shattered. He wondered how long they had sat there saying nothing, and how long the silence might continue. Easter, he believed, would never address him. Even the temporary intimacy that

the barter of the gun had brought about was gone. The girl seemed lost in unconsciousness. The mother had gone to her loom, and was humming softly to herself as she passed the shuttle to and fro. Clayton turned for an instant to watch her, and the rude background, which in the interest of his speculations he had forgotten, thrust every unwelcome detail upon his attention: the old cabin, built of hewn logs, held together by wooden pin and auger-hole, and shingled with rough boards; the dark, windowless room; the unplastered walls; the beds with old-fashioned high posts, mattresses of straw, and cords instead of slats; the homemade chairs with straight backs, tipped with carved knobs; the mantel filled with utensils and overhung with bunches of drying herbs; a ladder with half-a-dozen smooth-worn steps leading to the loft; and a wide, deep fireplace—the only suggestion of cheer and comfort in the gloomy interior. An open porch connected the single room with the kitchen. Here, too, were suggestions of daily duties. The mother's face told a tale of hardship and toil, and there was the plow in the furrow, and the girl's calloused hands folded in her lap. With a thrill of compassion Clayton turned to her. What a pity! what a pity! he thought. Just now her face had the peace of a child's; but when aroused, an electric fire burned from her calm eyes and showed the ardent temperament that really lay beneath. If she were quick and sympathetic,—and she must be, he thought,—who could tell how rich and infinite the development possible for her with this latent fire properly directed?

"You hain't seen much of this country, I reckon. You hain't been here afore?"

The mother had broken the silence at last.

"No," said Clayton; "but I like it very much."

"Do ye?" she asked in surprise. "Why, I 'lowed you folks from the settlements thought it mighty scraggy down hyar."

"Oh, no. These mountains and woods are beautiful, and I never saw lovelier beech-trees. The coloring of their trunks is so exquisite, and the shade is so fine," he concluded lamely, noticing a blank look on the old woman's face. To his delight the girl half turned toward him, was listening with puzzled interest.

"Well," said the old woman, "beeches is beautiful ter me when they 's mast enough ter feed ther hogs."

Carried back to his train of speculations, Clayton started at this abrupt deliverance. There was a suspicion of humor in the old woman's tone that showed an appreciation of their different standpoints. It was lost on Clayton, however, for his attention had been caught by the word "mast," which, by some accident, he had never heard before.

"Mast," he asked, "what is that?"

The girl looked toward him in amazement, and burst into a low, suppressed laugh. Her mother explained the word, and all laughed heartily.

Clayton soon saw that his confession of ignorance was a lucky accident. It brought Easter and himself nearer common ground. She felt that there was something after all that she could teach him. She had been overpowered by his politeness and deference and his unusual language, and, not knowing what they meant, was overcome by a sense of her inferiority. The incident gave him the key to his future conduct. A moment later she looked up covertly and, meeting his eyes, laughed again. The ice was broken. He began to wonder if she really had noticed him so little at their first meeting as not to recognize him, or if her indifference or reserve had prevented her from showing the recognition. He pulled out his note-book and began sketching rapidly, conscious that the girl was watching him. When he finished, he rose, picking up the old flint-lock.

"Won't ye stay and hev some dinner?" asked the old woman.

"No, thank you."

"Come ag'in," she said cordially, adding the mountaineer's farewell, "I wish ye well."

"Thank you, I will. Good day."

As he passed the girl he paused a moment and dropped the paper into her lap. It was a rude sketch of their first meeting, the bull coming at him like a tornado. The color came to her face, and when Clayton turned the corner of the house he heard her laughing.

"What air ye a-laughin' at?" asked the mother, stopping her work and looking around.

For answer Easter rose and walked into the house, hiding the paper in her bosom. The old woman watched her narrowly.

"I never seed ye afeard of a man afore," she said to herself. "No, nur so tickled 'bout one, nuther. Well, he air ez accommodatin' a feller ez I ever see, ef he air a furriner. But he was a fool to swop his gun fer hern."

## V.

THEREAFTER Clayton saw the girl whenever possible. If she came to the camp, he walked up the mountain with her. No idle day passed that he did not visit the cabin, and it was not long before he found himself strangely interested. Her beauty and fearlessness had drawn him at first; her indifference and stolidity had piqued him; and now the shyness that displaced these was inconsistent and puzzling. This he set himself deliberately at work to remove, and the conscious effort gave a pe-

culiar piquancy to their intercourse. He had learned the secret of association with the mountaineers to be as little unlike them as possible, and he put the knowledge into practice. He discarded coat and waistcoat, wore a slouched hat, and went unshaven for weeks. He avoided all conventionalities, and was as simple in manner and speech as possible. Often when talking with Easter, her face was blankly unresponsive, and a question would sometimes leave her in confused silence. He found it necessary to use the simplest Anglo-Saxon words, and he soon fell into many of the quaint expressions of the mountaineers and their odd, slow way of speech. This course was effective, and in time the shyness wore away and left between them a comradeship as pleasant as unique. Sometimes they took long walks together on the mountains. This was contrary to mountain etiquette, but they were remote even from the rude conventionalities of the life below them. They even went hunting together, and Easter had the joy of a child when she discovered her superiority to Clayton in woodcraft and in the use of a rifle. If he could tell her the names of plants and flowers they found, and how they were akin, she could show him where they grew. If he could teach her a little more about animals and their habits than she already knew, he had always to follow her footsteps in the search for game. Their fellowship was, in consequence, never more complete than when they were roaming the woods. In them Easter was at home, and her ardent nature came to the surface like a poetic glow from her buoyant health and beauty. Then appeared all that was wayward and elfin-like in her character, and she would be as playful, wilful, evanescent as a wood-spirit. Sometimes, when they were separated, she would lead him into a ravine by imitating a squirrel or a wild turkey, and, as he crept noiselessly along with bated breath and eyes peering eagerly through the tree-tops or the underbrush, she would step like a dryad from behind some tree at his side, with a ringing laugh at his discomfiture. Again, she might startle him by running lightly along the fallen trunk of a tree that lay across a torrent, or, in a freak of wilfulness, would let herself down the bare face of some steep cliff. If he scolded her, she laughed. If he grew angry, she was serious instantly, and once she fell to weeping and fled home. He followed her, but she barricaded herself in her room in the loft, and would not be coaxed down. The next day she had forgotten that she was angry.

Her mother showed no surprise at any of her moods. Easter was not like other "gals," she said; she had always been "quar," and she reckoned would "allus be thet way." She

objected in no wise to Clayton's intimacy with her. The "furriner," she told Raines, was the only man who had ever been able to manage her, and if she wanted Easter to do anything "ag'in' her will, she went to him fust," a simple remark that threw the mountaineer into deep thoughtfulness.

Indeed, this sense of power that Clayton felt over the wilful, passionate creature thrilled him with more pleasure than he would have been willing to admit; at the same time it suggested to him a certain responsibility. Why not make use of it, and a good use? The girl was perhaps deplorably ignorant, could do but little more than read and write; but she was susceptible of development, and at times apparently conscious of the need of it and desirous for it. Once he had carried her a handful of violets, and thereafter an old pitcher that stood on a shelf blossomed every day with wild flowers. He had transplanted a vine from the woods and taught her to train it over the porch, and the first hint of tenderness he found in her nature was in the care of that plant. He had taken her a book full of pictures and fashion-plates, and he had noticed a quick and ingenious adoption of some of its hints in her dress.

One afternoon, as he lay on his bed in a darkened corner of his room, a woman's shadow passed across the wall, returned, and a moment later he saw Easter's face at the window. He had lain quiet, and watched her while her wondering eyes roved from one object to another, until they were fastened with a long, intent look on a picture that stood upon a table near the window. He stirred, and her face melted away instantly. A few days later he was sitting with Easter and Raines at the cabin. The mother was at the other end of the porch, talking to a neighbor who had stopped to rest on his way across the mountains.

"Easter air a-gittin' high notions," she was saying, "'n' she air a-spendin' her savin's, 'n' all mine she kin git hold of, ter buy fixin's at the commissary. She must hev white crockery, 'n' towels, 'n' new-fangled forks, 'n' sich-like." A conscious flush came into the girl's face, and she rose hastily and went into the house.

"I was afeard," continued the mother, "that she would hev her hair cut short, 'n' be a-flyin' with ribbins, 'n' spangled out like er rainbow, like old 'Lige Hicks's gal, ef I had 'n' hearn the furriner tell her it was 'beastly.' Thar hain't no fear now, fer what thet furriner don't like, Easter don't nuther."

For an instant the mountaineer's eyes had flashed on Clayton, but when the latter, a trifle embarrassed, looked up, Raines apparently had heard nothing. Easter did not reappear until the mountaineer was gone.

There were other hopeful signs. Whenever

Clayton spoke of his friends, she always listened eagerly, and asked innumerable questions about them. If his attention was caught by any queer phrase of the mountain dialect or custom, she was quick to ask in return how he would say the same thing, and what the custom was in the "settlements." She even made feeble attempts to model her own speech after his.

In a conscious glow that he imagined was philanthropy, Clayton began his task of elevation. She was not so ignorant as he had supposed. Apparently she had been taught by somebody, but when asked by whom, she hesitated answering, and he had taken it for granted that what she knew she had puzzled out alone. He was astonished by her quickness, her docility, and the passionate energy with which she worked. Her instant obedience to every suggestion, her trust in every word he uttered, made him acutely and at times uncomfortably conscious of his responsibility. At the same time there was in the task something of the pleasure that a young sculptor feels when, for the first time, the clay begins to yield obedience to his fingers, and something of the delight that must have thrilled Pygmalion when he saw his statue tremulous with conscious life.

## VI.

THE possibility of lifting the girl above her own people, and of creating a spirit of discontent that might embitter her whole life, had occurred to Clayton; but at such moments the figure of Raines came into the philanthropic picture forming slowly in his mind, and his conscience was quieted. He could see them together; the gradual change that Easter would bring about in him, the influence of the two on their fellows. The mining-camp grew into a town with a modest church, having a cottage on the outskirts, where Raines and Easter were installed. They stood between the old civilization and the new, understanding both, and protecting the native strength of the one from the vices of the other, and training it after more breadth and refinement. But Raines and Easter did not lend themselves to the picture so readily, and gradually it grew vague and shadowy, and the figure of the mountaineer was blurred.

Clayton did not bring harmony to the two. At first he saw nothing of the mountaineer, and when they met at the cabin Raines remained only a short time. If Easter cared for him at all, she did not show it. How he was regarded by the mother, Clayton had learned long ago, when, in answer to one of his questions, she had said, with a look at Easter, that "Raines was the likeliest young feller in thet region"; that "he knew more 'n anybody

round thar"; that "he hed spent a year in the settlemint, was mighty religious, and would one day be a circuit-rider. Anyhow," she concluded, "he was a mighty good friend o' theirs."

But as for Easter, she treated him with unvarying indifference, though Clayton noticed she was more quiet and reserved in the mountaineer's presence; and what was unintelligible to him, she refused to speak of her studies when Raines was at the cabin, and warned her mother with an angry frown when the latter began telling the mountaineer of "whut a change hed come over Easter, and how she reckoned the gal was a-gittin' eddicated enough fer ter teach anybody in the mountains, she was a-studyin' so much."

After that little incident, he met Raines at the cabin oftener. The mountaineer was always taciturn, though he listened closely when anything was said, and, even when addressed by Easter's mother, Clayton noticed that his attention was fixed on Easter and himself. He felt that he was being watched, and it irritated him. He had tried to be friendly with the mountaineer, but his advances were received with a reserve that was almost suspicion. As time went on, the mountaineer's visits increased in frequency and in length, and at last one night he remained so long that, for the first time, Clayton left him there.

Neither spoke after the young engineer was gone. The mountaineer sat looking closely at Easter, who was listlessly watching the moon as it rose above the Cumberland Range and brought into view the wavering outline of Pine Mountain and the shadowed valley below. It was evident from his face and his eyes, which glowed with the suppressed fire of some powerful emotion within, that he had remained for a purpose; and when he rose and said, "I guess I 'd better be a-goin', Easter," his voice was so unnatural that the girl looked up quickly.

"Hit air late," she said, after a slight pause.

His face flushed, but he set his lips and grasped the back of his chair, as though to steady himself.

"I reckon," he said, with slow bitterness, "thet hit would 'a' been early ez long ez the furrin was here."

The girl was roused instantly, but she said nothing, and he continued in a determined tone:

"Easter, thar 's a good deal I 've wanted to say to ye fer a long time, but I hev kept a-puttin' hit off until I 'm afeard maybe hit air too late. But I 'm a-goin' to say hit now, and I want ye to listen." He cleared his throat huskily. "Do ye know, Easter, what folks in the mountains is a-sayin'?"

The girl's quick insight told her what was coming, and her face hardened.

"Hev ye ever knowed me, Sherd Raines, to keer what folks in the mountains say? I reckon ye mean ez how they air a-talkin' about me?"

"Thet 's what I mean," said the mountaineer—"you 'n' *him*."

"Whut air ye a-sayin'?" she asked defiantly. Raines watched her narrowly.

"They air a-sayin' ez how he air a-comin' up here mighty often; ez how Easter Hicks, who hev never keered fer any man, is in love with this furriner from the settlemints."

The girl reddened, in spite of her assumed indifference.

"They say, too, ez how he is not in love with her, 'n' thet somebody oughter warn Easter thet he air not a-meanin' good to her. Ye hev been seen a-walkin' in the mountains together."

"Who hev seen me?" she asked, with quick suspicion. The mountaineer hesitated.

"I hev," he said doggedly.

The girl's anger, which had been kindling against her gossiping fellows, blazed out against Raines.

"Ye hev been a-watchin' me," she said angrily. "Who hev gin ye the right ter do it? What call hev ye ter come hyar and tell me whut folks is a-sayin'? Is it any o' yer business? I want to tell ye, Sherd Raines,"—her utterance grew thick with anger,—"thet I kin take care o' myself; thet I don't keer what folks say; 'n' I want ye to keep away from me. 'N' ef I sees ye a-hangin' round 'n' a-spyin', ye 'll be sorry fer it." Her eyes blazed, she had risen and drawn her lithe figure straight, and her hands were clenched.

The mountaineer had stood motionless. "Thar 's another who hez seen ye," he said quietly—"up thar," pointing to a wooded mountain the top of which was lost in mist. The girl's attitude changed instantly into vague alarm, and her eyes flashed upon Raines as though they would sear their way into the meaning hidden in his quiet face. Gradually his motive seemed to become clear, and she advanced a step toward him.

"So ye hev found out whar dad is a-hidin'?" she said, her voice tremulous with rage and scorn. "'N' ye air mean and sorry enough to come hyar 'n' tell me ye 'll give him up to the law ef I don't knuckle down 'n' do whatever ye wants me?"

She paused a moment. Was her suspicion correct? Why did he not speak? She did not really believe what she said. Could it be true? Her nostrils quivered; she tried to speak again, but her voice was choked with passion. With a sudden movement she snatched her rifle from its place, and the steel flashed in the moonlight

and ceased in a shining line straight at the mountaineer's breast.

"Look hyar, Sherd Raines," she said in low, unsteady tones, "I know ye air religious, 'n' I know ez how, when ye hev gin yer word, ye will do what you say. Now, I want ye to hold up yer right hand and sw'ar that ye 'll never tell a livin' soul that you know whar dad is a-hidin'."

Raines did not turn his face, which was as emotionless as stone.

"Air ye a-goin' ter sw'ar?" she asked, with fierce impatience. Without looking at her, he began to speak—very slowly:

"Do ye think I'm fool enough to try to gain yer good will by a-tellin' on yer dad? We were on the mountains, him 'n' me, 'n' we saw ye 'n' the furriner. Yer dad thought hit was a' officer, 'n' he whipped up his gun 'n' would 'a' shot him dead in his tracks ef I had n't hindered him. Does thet look like I wanted ter hurt ther furriner? I hev knowed yer dad was up in the mountains all the time, 'n' I hev been a-totin' things fer him ter eat. Does thet look like I wanted ter hand him over ter the law?"

The girl had let the rifle fall, and, moving away, stood leaning on it in the shadow, with her face downcast.

"Ye hev wanted ter know what call I hev ter watch ye, 'n' see thet no harm comes to ye. Yer dad hev gin me the right. Ye know how he hates furriners, 'n' whut he would do ef he should run across this furriner atter he hez been drinkin'. I'm a-meddlin' because I hev told him thet I am goin' ter take keer o' ye, 'n' I mean ter do it—ef ye hates me fer it. I'm a-watchin' ye, Easter," he continued, "'n' I want ye ter know it. I knowed the furriner begin comin' here because ye air not like gals in the settlemint. Ye air as cur'us to him as one o' them bugs an' sich-like thet he's always a-pickin' up in the woods. I hev n't said nuthin' ter yer dad, fer fear o' his harmin' the furriner; but I hev seen thet ye like him, an' hit's time now fer me ter meddle. Ef he was in love with ye, do ye think he would marry ye? I hev been in the settlemint. Folks thar air not ez we citizens air. They air bigoted 'n' high-heeled, 'n' they look down on us. I tell ye, too, 'n' hit air fer yer own good, he air in love with somebody in the settlemint. I hev hearn it, 'n' I hev seen him a-lookin' at a picter in his room ez a man don't look at his mother nur his sister. They say hit's her.

"Thar's one thing more, Easter," he concluded, as he stepped from the porch. "He is a-goin' away. I heard him say it yestiddy. What will ye do when he's gone ef ye lets yerself think so much of him now? I hev warned ye now, Easter, fer yer own good, though ye mought think thet I'm a-workin' fer myself. But I know

I hev done my duty. I hev warned ye, 'n' ye kin do whut ye please, but I'm a-watchin' ye."

The girl said nothing, but stood as rigid as a statue, with eyes wide open and face tense and white, as the mountaineer's steps died away. She was bewildered by the confused emotions that swayed her. Why had she not indignantly denied that she was in love with the "furriner"?

ENGRAVED BY J. F. JUNGLING.

THE OLD WOMAN.

Raines had not hinted it as a suspicion. He had spoken it outright as a fact, and he must have thought that her silence confirmed it. He had said that the "furriner" cared nothing for her, and had dared to tell her that she was in love with him. Her cheeks began to burn. She would call him back and tell him that she cared no more for the "furriner" than she did for him. With a quick movement she threw the rifle to its place, but paused, straining her eyes through the darkness. It was too late, and, with a helpless little cry, she began pacing the porch. She had scarcely heard what was said after the mountaineer's first accusation, so completely had that enthralled her mind; but now fragments came back to her. There was something about a picture—ah! she remembered that picture. Passing through the camp one afternoon, she had glanced in at a window and had seen a rifle once her own. Turning in rapid wonder about the room, her eye lighted upon a picture on a table near the window. She had felt the refined beauty of the girl, and it had impressed her with the same timidity that Clayton did when she first knew him. Fascinated, she had looked till a movement in the room made her shrink away. But the face had clung in her memory ever since, and now it came before her vividly.

EASTER.

ENGRAVED BY H. DAVIDSON.

Clayton was in love with her. Well, what did that matter to *her*?

There was more that Raines said. "Goin' away"—she recalled these words too. Raines meant the "furriner," of course. How did he know? Why had Clayton not told her? She did not believe it. But why not? He had told her that he would go away some time, and why not now? But why—why did not Clayton tell her? Perhaps he was going to *her*. She almost stretched out her hands in a sudden, fierce desire to clutch the round throat and sink her nails into the soft flesh that rose before her mind. She had forgotten that he had ever told her that he must go away, so little had it impressed her at the time, and she had never thought of a possible change in their relations or in their lives. She tried to think what her life would be after he was gone, and she was frightened; she could not imagine her old life resumed. When Clayton came, it was as though she had risen from sleep in a dream and had lived in it thereafter without questioning its re-

ality. Into his hands she had delivered her life and herself with the undoubting faith of a child. She had never thought of their relations at all. Now the awakening had come. The dream was shattered. For the first time her eye was turned inward, where a flood of light brought into terrible distinctness the tumult that began to rage so suddenly within.

One hope flashed into her brain—perhaps Raines was mistaken. But no, the mountaineer would never lie. But even if he were mistaken, Clayton must go some time; even *he* had told her that. In the recognition of this fact every thought became centered. It was no longer how he came, the richness of the new life he had shown her, the barrenness of the old, Raines's accusation, the shame of it—the shame of being pointed out and laughed at after Clayton's departure; it was no longer wonder at the strange, fierce emotions racking her brain and heart for the first time: her whole being was absorbed in the recognition which slowly forced itself into her brain and

took possession of it—some day he must go away; some day she must lose him. She could not realize it. She lifted her hands to her head in a dazed, ineffectual way. The moonlight grew faint before her eyes; mountain, sky, and mist were indistinguishably blurred; and the girl sank down slowly upon her trembling knees, down till she lay crouched on the floor with her white, tearless face buried in her arms.

The moon rose high above her and sank down in the west. The shadows shortened and crept back to the woods, night noises grew fainter,

and the mists floated up from the valley and clung around the mountain-tops; but she stirred only when a querulous voice came from within the cabin.

"Easter," it said, "ef Sherd Raines air gone, ye hed better come in ter bed. Ye hev got a lot o' work ter do ter-morrer."

The voice called her to the homely duties that had once filled her life and must fill it again. It was a summons to begin anew a life that was dead, and the girl lifted her haggard face in answer and rose wearily.

(To be concluded.)

*John Fox, Jr.*

## A BACHELOR'S COUNSELINGS.

BY RICHARD MALCOLM JOHNSTON.

WITH PICTURES BY E. W. KEMBLE.

"The meek will he guide in judgment."

I.

CURIOUS is the inequality often noticed in human friendships. Indeed, as a rule, the most devoted seem to exist between unequals, superiors submitting complacently to be loved, indulged, and waited on, inferiors content to submit and serve, sometimes even thankful to do so. How uncomplainingly Theseus accepted the love and sacrifices of Pirithoüs! How touching to David the devotion of Jonathan, "passing the love of women"!

Of a kind similar, although upon a lower plane, were the loves of Jones Kindrick, the greater, and Simeon Newsome, the less. Four miles south of our village, at the crossing of the county-seat road by one leading from the west toward Ivy's Bridge on the Ogeechee River, dwelt the Newsomes. Their large square mansion kept within plenty of good things for their enjoyment, and that of others who came there with or without special invitation. A mile and a half east, near the road last mentioned, in a dwelling somewhat smaller but whiter, lived the Kindricks. The heads of these families had died some years before, and their widows, who were cousins, had been managing the estates well during the time it took the boys to grow old enough for such responsibilities. As for Sim (nobody except his mother ever called him Simeon), as long as he had been any thing, he had been as steady as any clock. He seldom laughed, except when politeness so required. Not that he was morose; it was only

that he rarely saw or heard things which to him seemed worthy of laughing about. He had tried to take to schooling with the fondness desired by his parents, but while in the midst of demonstrative and other adjective pronouns in the forenoons, and of tare and tret and the double rule of three in the afternoons, not seeing his way clear, he pleaded fatigue, after such fruitless endeavors, and begged of his father to be let go to plowing.

A set-off to Sim's humility was the pride he felt in the abilities of his cousin Jones, a year older than himself. This had been going on from childhood until now, when each had reached his majority. While at school Sim was looked upon as better than Jones in little things like spelling and reading, for which Jones expressed contempt that had much influence upon Sim's imagination of his greatness. This was exalted higher when Sim broke down, and Jones, misliking the plow with which he had been threatened, dashed forward, and got along whether or no, cajoling where he could not delay to conquer, hopping over where he could not cajole, or, with connivance of the master (who liked not to lose a good-paying scholar), slipped through behind others who had opened the way for themselves, and always looked and talked like one who was moving from victory to victory. In time he had acquired a stock of words, many of them new, which filled Sim with admiration not less fond than awful. Of middle height, brown, brawny, solemn-faced, he never felt a pulsation of envy when he looked at the tall, slender, fair, ever-smiling Jones.

It went on thus after they had taken control of the plantations. Sim's sense of inferiority ought to have subsided when it appeared how much better he understood and conducted business; but knowing that the soul of Jones was too high to let itself be entirely engrossed in mere agriculture, he was pleased when the latter from time to time let him offer counsel—and followed it.

For a time Jones had been circulating himself and his vocabulary among the girls, and his mother and his sister Maria, the latter two years older than himself, plain of feature, sensible of mind, and industrious of body, wished that he would get married and settle down to steady work. He let them urge, and answered that his matrimonial cogitations had not yet come to a head.

"Yes," said his mother one day, "you think you must be a mighty picker and chooser; and if you don't look out, you'll go clean through the woods and then have to be satisfied with a crooked stick. If you only knew it, S'phrony Miller is the girl for you—that is, if you could get her."

"As for the ability of sophisticating S'phrony Miller into the chains of matrimony, ma, I—no; perhaps I ought n't to use the words."

"I would n't if I were in your place," said Miss Maria. "It would be a good thing for you to get S'phrony, if you could. If you'd marry, Cousin Sim would. I really believe he's waiting to see when you are going to settle before starting out himself, intending to keep himself entirely out of your way."

"Sim! He's a dear good fellow, is n't he? I wish Sim had a better gift of languages; but—oh, old Sim will get on well enough, I hope. As for me and myself, you and ma, and, I may say, all other ladies, ha! ha! will have to wait till my mind comes to judgment."

"I say *judgment!*" retorted his mother, probably not knowing herself precisely all that she intended to convey by the remark.

It was different with Sim. Having reached manhood safely, soundly, and honorably, it began to occur to him that it might be a good thing to get a wife. At first there was no eagerness in the notion. He had been too busy to go about much, and it was only when riding to Horeb meeting-house and back again,—sometimes perhaps during a long sermon within,—that he had begun to throw, with moderately heightened interest, speculative eyes among the pretty girls who were there in such profusion. Then his observations of the life led by Mr. Billy Downs, the most respectable old bachelor among his acquaintances, backed by numerous kind admonitions bestowed upon him by the latter, were leading gradually to the decision that, on the whole, married life was

preferable to single, when one took the pains to study their several promises of results, general and special.

## II.

Now when, with this thought on his mind, Sim next went to the Millers', whose place joined both the Newsomes' and the Kindricks', and looked at S'phrony from his new point of view, he felt that he was content to rest there. S'phrony, who was a tall, rather blonde, pensivish, sweet-looking girl, and her young sister were the only offspring of their parents. Their dwelling was yet smaller than the Kindricks', but whiter, and more shrubby was in the yard than in both the other places put together. If the plantation had less acreage, the land was fresher, and it would not have been easy to say of the two sides, one adjoining the Newsomes', and the other the Kindricks', which was the better.

When S'phrony noticed that the remarks lately made by Sim at the house, although not numerous, seemed to have been intended mainly for herself, she felt the interest usually rising on such occasions, and from that time her talk, the way she dressed, the increased perfume of flowers, and one thing and another about the room, the non-appearing of her sister and parents when he called, all tended to confirm him in the thought that he was attempting what, if successful, would be a good and sensible thing.

Mr. Billy Downs, between whom and himself was an intimacy which, on the part of the former, was warmly fond, urged him to be as quiet as possible, but correspondingly speedy. The reasons for his advice he had sufficient grounds for not fully disclosing. Yet Sim's instincts convinced him that it was good, and at his fourth visit he was not far from putting to S'phrony a question as pointed as he knew how to frame it. He fully resolved that he would do so at the next, and but for one thing this would have been done. That thing—not meaning, by use of such a word, to be openly offensive to his memory—was Jones Kindrick. For—don't you know?—no sooner had he found that Sim was going to the Millers' in suspicious circumstances, than he went to running there himself. More than that, he made it his business to come over to the Newsomes', and, not finding Sim at the house, to follow him out to the very field where Sim was overseeing the hands. When he found him, thousands upon thousands of words were used by him, of which I shall here put down a few:

"Ma and sister Maria have been for some time past specified. They have both been going on to me about S'phrony Miller in a way and to an extent that in some circumstances might be called even obstreperous; and to quiet their conscience, I've begun a kind of a

MR. BILLY DOWNS.

visitation over there, and my mind has arriv at the conclusion that she 's a good, nice piece of flesh, to use the expressions of a man of the world and society. What do you think, Sim, of the matter under consideration, and what would you advise, as I like to have your advice sometimes, and I 'd like to know what it would be under all the circumstances and appurtenances of a case which, as it stands, it seems to have, and it is n't worth while to conceal the fact that it *does* have, a tremendous amount of immense responsibility to all parties, especially to the undersigned, referring, as is well known in books and newspaper advertisements, to myself. What would you say to the above, Sim, in all its parts and parties?"

It was fortunate for Sim that his hopes had not been lifted so high that their sudden fall would be too extremely painful. Through the hints of Mr. Downs he had been feeling some apprehension as to what Jones might do when he heard of his visits to S'phrony, and he held his feelings in restraint. He now drew a long breath, the significance of which was lost upon his cousin; then answered:

"I did n't—that is, I never quite got all your languages, Jones; but my opinion of S'phrony is, that she 's the equil of—I may say—yes, of any of 'em. Ahem!"

"Your advice then, Sim, is not to the contrary, in all the circumstances?"

"You mean—is it your meaning to the courting of S'phrony, Jones?"

"You may say words to that effect, for the sake of the whole argyment."

"My advice," answered Sim, after swallowing the air that had accumulated in his mouth—"my advice would be to *anybody*—that is, I mean any *marrin'* man—that *wanted* S'phrony, if I was asked for my advice, I should give it to git S'phrony if he can. I have no hization about that, nor not a doubt."

"Of course, Sim, in an affair magnified as we are on now, your opinion is worth more than ma's and sister Maria's both put together, although it 's a satisfaction that, as the case now stands, you colide with 'em perfect. I have not yet represented to S'phrony any open remarks; but I have insinooated a few pleasant words to her, and her looks on those occasions were that she were expecting more of the same sort; and now, since I 've had this highly interesting conversation with you, I rather think I shall govern myself according. Still, there can be no doubt, I don't suppose, but what the future is before us, just like the past is behind us, and I can't but thank you for your kind remarks, so entire coliding with ma and sister Maria."

Brave man was Simeon Newsome, and in most things self-reliant enough; but he believed that he knew perfectly well that nothing could be more vain than for such as he to essay to rival a man of such vast sentiments and such boundless powers of expression. Never had Jones appeared so great before his eyes, what time he could take them off the ground and look up his full length. In his mind he bade S'phrony Miller farewell, except as a prospective cousin, and when Jones, after oceans of other words, went away, he tried to go to thinking about something else. The long habit of submission to his superior, and somewhat of the old gratification of seeing him an easy leader in movements of his genius and inclination, soon induced a condition of moderate resignation. Had it not been so with Piri-thois after the success of the joint endeavors of Theseus and himself in that first "rape of Helen" in the temple of Diana Orthia? Did he not foresee that the lots cast for her would fall to the greater? As far back as that one understood well enough how such things go, and so, uncomplaining, even congratulatory, the subordinate went away to seek the less fair Kore among the Molossians.

Far less content with the condition of things was Mr. Billy Downs. A brief description must serve for the outside of him. He was a rather small, grizzly, thin, but wiry gentleman, somewhere between forty-five and fifty. He lived in a double log house a mile nearer the village

than the Newsomes. He could have afforded to put up a far better mansion, making and laying up as he had been doing for the last twenty-five years. Everybody liked him, and he liked everybody except Jones Kindrick; but this exception was because he loved Sim Newsome better than anybody else. According to neighborhood tradition, Mr. Downs had reason to feel peculiar tenderness for Sim. In his youth he had wanted, and in his unskilful way had tried to get, Sim's mother when she was Miss Fortner. Failing in this, he drew himself in, and stayed there until this son had grown old enough to make acquaintance beyond the domestic circle, since when, notably since the death of Mr. Newsome, he had been indulging for him a feeling somewhat like parental, and it grieved him to see that he was rather dwarfed by his admitted inferiority to Jones Kindrick. The process of affiliation was slow, because Mr. Downs seldom went to the house in Mr. Newsome's lifetime, and after his death, from feelings of delicacy, never. When this good man saw how things had gone in the matter of S'phrony Miller, he decided to throw out a few words, holding back others to a later day. Using a name fonder than that by which Sim was commonly addressed, he said:

"Simyul, if it have been me, when I see Jones a-beginnin' to use over there at the Millers', with his striped kervats and them dictionary words, that was above my inf'mation, I should have done like you and drawn in my horns. You ain't the pushin' feller Jones Kindrick is, and my expe'unce is, it take pushin' with female young women to make much headway among 'em. I did hope it were yourn and S'phrony's lot, because she 's a fine young woman. But it seem like it were n't; special as Jones is a kind of a cousin, and have always let you give up to him, which people says he ought n't too—that is, everlastin'. But now, Simyul, if it was me, I should spread out, and maybe git up a still-hunt outside o' Jones's range, and see what 's to come of him and S'phrony. For two things is absolute certain. One of 'em is, S'phrony ain't the onlest girl in the State o' Georgy, and the other is, they ain't no tellin' the final upshot of her and Jones, *and*—well, if it was me, I should peeruse around at conven'ent times, and maybe ride over t' other side the river—we 'll say up, in, and along there about Williams Creek meetin'-house, where Jes Vinson live, and he have a big plantation and a daughter besides. But I should make a still-hunt if it was me, because they ain't any countin' on Jones, and special when he see you a likely to git ahead of him. Of course I got nothin' ag'inst Jones Kindrick, only I *do* wish that Jones Kindrick could git to understand that he ain't to have

*every* girl in the whole State, and special them that he see you a-buckin' up to."

Upon these words, apparently wise and evidently forbearing, Sim felt that he ought at least thoughtfully to ponder.

### III.

On a Saturday not long afterward, as Mr. Jesse Vinson, one of the deacons, was listening with subdued attention to the sermon then being delivered by the pastor of Williams Creek meeting-house, he observed a young man come in softly, take a seat decorously, and with proper solemnity keep his eyes on the preacher during the remainder of the discourse. When a recess was taken prior to the meeting of the regular conference, Mr. Vinson, having learned that the stranger was the son of his old friend and church brother Eli Newsome, asked if he would go and spend the night with him. Sim naturally answered yes. Arrived at the Vinson mansion, a respectable brick two-story, a mile away, he found, as Mr. Downs had said, that a young girl was there, and that she was not unlike S'phrony Miller, only taller, dressier, and more chatty. With such a girl a bashful young man can make his way more easily than with one like himself. Alley Vinson kindly led him along paths which she discovered he could tread with least embarrassment. When he went to bed that night, he felt that perhaps he had done a good thing by venturing there. So he felt next morning on the way to meeting, and so when the congregation was dispersing, and he bade her good-by, and thanked her for the invitation to come again.

I don't remember if it was ever known positively how Jones Kindrick found out that Sim had been to Williams Creek: but Mr. Billy Downs afterward said that he was glad of it, although he never admitted that he had contributed anything leading to the information. At all events, at the next meeting-day at Horeb, two weeks thereafter, Jones hardly more than spoke to Sim and the latter was surprised, after the people were going back home, to see nobody in this wide world riding along with S'phrony but her father and sister, and S'phrony all the while looking as if she felt as lonesome as she could be. Mr. Downs and Sim traveled along together. The former was as punctual at religious services as the very deacons. Conscious of being a bachelor and a sinner, and therefore unmeet for the kingdom of heaven, he had never applied for membership, but he hoped, by the use of other outward means, to make his case as mild as possible at the final judgment, which naturally he hoped would be put off as long as possible.

"It look like a onlucky accident, Simyul, but

my hopes is it 'll turn out for the best. Jones have a evident a struck on to your trail acrost the river; and now look at him yonder among them men, a-wavin' of his tongue and the balance o' hisself, and S'phrony along of her pa and her sister by her lone self. Somethin's up betwix' him and her; and if it was me, I should n't go to no Williams Creek next meetin'-day, but I should wait to see where the cat 's goin' to jump."

"I 've done made up my mind that I ain't a-goin' there for yet a while."

"Of course you ain't; I knewed all the time you were n't. Now, if it was me, I should feel like givin' my horse a cut and gallopin' up, and sidlin' in there by S'phrony, betwix' her and her pa; but I don't think I'd do it quite yit a while, so public like that, when her feelin's has been hurt, that is, provided she have 'em for Jones, which I always can *not* but has had my doubts, and special now when he 's a open neglectin' of her in that kind o' style. And if it was me, I should let Jones have all the rope he want."

Other talk they had on the way. Mr. Downs had not command of what he called Jones Kindrick's dictionary words, but when he felt like it, he could be equally voluminous. Stammering had been the language in which the single love of his youth had been conveyed, but now in the romance of this young man whom his imagination had adopted for a son, uncertain, unfixed though it was, he felt an interest equal to that of the most impassioned lover.

Mr. Downs had wished heartily for Sim to marry S'phrony. In his mild way often he had remonstrated with him for his habitual yielding to Jones. Sim had listened to his praise without objecting; for to the humblest as to the vainest sweet are the panegyrics of a friend. Yet it would have been too painful, therefore it was not possible, to part from the exalted estimate that he had had of Jones all his life. Mr. Downs recognized this; and therefore instead of blaming, he seemed rather to ratify his withdrawal from his little stage when Jones with his paraphernalia of every sort stepped upon the boards. It was for this also that he sent Sim upon the expedition across the river. He believed that Alley Vinson would be an entirely

safe investment, yet the main motive was to excite in Jones curiosity first, and afterward jealousy, and so lead him away from the Millers'. He believed now that he had succeeded. His last words to Sim were:

"You lay low, Simyul; keep a-layin' low as you can git. They ain't no tellin' what Jones 'll do, nor what he won't do. But one thing is certain: Jones Kindrick can't do *everything*, a includin' the marryin' of everybody. You may stick a pin right there among them words."

"YOU TALK LIKE I WAS A PIECE OF POUND-CAKE, OR A TUMBLER OF SILLIBUB."

He rode on home, his mind occupied with all the wistful thoughts and the sweet thoughts of a true lover. Bless his old heart!

#### IV.

AMONG the rural folk of that generation courtships and espousals were for the most part brief. Of the two, Sim and Jones, Alley's father liked better the former; but Sim, acting on the counsel of Mr. Downs, was lying low on his side of the river, and perhaps Alley felt a tiff for such neglect. At all events, about two months afterward, Jones went over there in the family carriage, and brought her back with him to stay.

It was pleasant to see Mr. Downs when Jones was taken out of all rival possibilities with his dear Simyul.

"Simyul, it have come egzact as I wanted. Now you can come out and breathe the a'r free. And now you got the whole S'phrony Miller field before you, and if it was me I should go

in, and I should go in speedy, and I should go in bold."

Sim began at once to feel like a new man, and congratulated himself for following the salutary counsels of Mr. Downs. On the very next meeting-day S'phrony seemed to him nicer and sweeter than ever before. There was a merriness not habitual in her face and in her words when, after the start home, she referred to the new couple.

"Jones and his bride looked quite cozy and bright. Did n't you think so, Sim?"

right straight, like I wanted to do, and was a-goin' to do when I see Jones a-comin' and—and—and a-barkin' up the same tree."

Her laugh, unused as she was to great hilarity, rang loud.

"I—I declare I 'm glad to hear it, that I was mistaken."

"Did I say you were mistaken?"

"No; but you laughed, which go to show that you ain't been a-pesterin' your mind about Jones."

"No, indeed; I never put in any sort of

"I KNOW EGZACT HOW YOU FEEL, SIMYUL."

"Well, yes. Jones special looked very comfortable. I 'm glad he 's located at last."

"So am I."

"You? I—I 'm glad to hear it, S'phrony."

"What for?"

"Because I—I did n't know exactly how you and Jones stood."

"Stood? Why, we stood always as we 're standing now. What do you mean?"

"I—fact is, S'phrony, I thought Jones been a-wantin' of you."

"I hope you have n't been thinking that I wanted Jones."

She looked at him in mild, smiling reproach, and her lips were so red and her teeth so white that Sim was thankful that they did not and now never could belong to Jones.

"I did n't know—why, of course I did n't know, S'phrony."

"I knew you did n't. I suppose you did n't care."

"Oh, yes, I did; yes, I did."

"And suppose you had known that I did n't, then what?"

"Why, I should have put in then myself,

bid for Jones Kindrick. You always set a higher value on your cousin Jones than anybody else did—except Alley Vinson."

"And I 'm mighty glad she done it. Because," he said almost fretfully—"because ever since my mind been in a condition to want anybody for myself, I been a-wantin' of you."

"Why, then, did n't you come out like a man and tell me so?"

"It were because Jones—law me, S'phrony, I done told you about Jones."

"And then you thought you 'd go over to the Vinsons'."

She looked at him searchingly.

"It were Uncle Billy Downs sent me over there."

"For what?"

"Well, Uncle Billy say that it might s'gashuate Jones away from you."

"What in this world is that? *S'gashuate!* That word 's beyond me."

"It were Uncle Billy's word. He meant that Jones would be for puttin' out my tracks over there, like he put 'em out over here.

If I had have knew that Jones had called off from you, I declare on my word and honor, S'phrony, I 'd never went nigh there."

"Suppose you had thought that Jones jilted me, what would you have done then?"

"I 'd 'a' come at you jes the same, S'phrony, jes the same."

"Then I say, bless your heart, and Mr. Downs's too."

"I 'm glad to hear it."

He looked at her wistfully, and said not another word.

"Well?" at length she inquired.

"I—I got no more to say, but, soon as Jones were off the track for good, Uncle Billy and me we made up our minds for me to court you."

"Well, why don't you?"

"Ain't I been a-tryin' to do it, S'phrony, ever sence we left the meetin'-house?"

"Oh! now I think I understand you. What do you want me to say?"

"I want you to say yes, and then, waitin' like I been a-doin', I don't want you to put it off too fur."

"Well, sir, I 'll tell you now plain, Sim Newsome, that there is n't a man living that I would get married to inside of two months, and you need n't to ask me."

"Let me see; that would fetch it to middle of December. That 'll suit me, S'phrony. It 'll come in nice for Christmas."

"Laws help my heart, Sim! You talk like I was a piece of pound-cake, or a tumbler of sillibub."

"No comparison to them, S'phrony; not to a whole oven full o' pound-cake, nor a whole stand o' sillibub."

"Hush! And now let me tell you one thing, my young man. If I am to marry you, you have got to quit letting Jones Kindrick top you in every everlasting thing. I have been mad many a time to see how he has run over you, when you were worth ten times as much. Do you hear me?"

"I hear every word you say, S'phrony. Betwix' me and you and Uncle Billy Downs, I know Jones can be made to—to shinny on his own side."

"No, sir; I shall have nothing to do with it; and your uncle Billy Downs, as you call him, shall have nothing to do with it. If you can't keep yourself on a level with Jones Kindrick, I 'll—I think we 'd just as well drop it, and go to talking about something else. It 's right cool to-day, don't you think so, for the middle of October?"

"S'phrony, please don't go to drappin' all my feelin's down on the very ground, talkin' about the weather! I hain't been a-studyin' about the weather, nor thinkin' nor keerin' one

single continental whether it 's cool or hot. I ought n't to brought in you and Uncle Billy, and if you say so, the first time I ketch Jones Kindrick out of his house, I 'll whirl in on him and maul some of his big languages out of him. S'phrony, please take back what you said about the weather, won't you?"

She looked at him affectionately, and said:

"My dear Sim, I 'm not afraid that you won't assert your manhood. I take back all I said about the weather, and everything else that hurt you."

"I 'm glad to hear it. I hain't never been afraid of Jones. It 's his big languages which I never learnt that has made me keep out of his way. Jones know I can out-farm him, out-run him, fling him down, and can whip him, if it come to that; and now since I find you don't like my givin' up to him, which ma and Uncle Billy has always ruther scolded me for doin', he better keep some of his languages to himself, for me."

"There 'll be no need of any fussing. Jones will see that hereafter you intend to be your own man, and that will be all that is needed."

"I 'm glad to hear it."

"Is that all you have to say? If it had been Jones, he would have used some of his biggest words in saying what sort of wife I 'd make."

"Confound Jones!"

V.

It is a goodly sight, the influence of a good woman on a husband who needs it. Fortified by the support of S'phrony, Sim felt, if in some respects not yet the full equal of Jones, at least sufficient to all usual responsibilities. It delighted Mr. Downs to see him lift up his head among men, even in the presence of Jones, and not much less when the Newsome fence was extended in order to take in such a beautiful slice of the Miller land. In the next year Sim's mother died, after which Mr. Downs, his embarrassment being now all gone, visited freely at the house, and contributed his part to Sim's development into a big, solid, respectable farmer.

When the novelty with Jones was about over, he seemed to feel somewhat the constraint of being confined in his attentions to just one wife, especially when Alley showed herself to be a person who would not be willing to submit to any very great amount of foolishness. Her father's indebtedness was more than had been suspected, and the dowry that had come along with her was much less than what Jones had counted upon. Alley made up, at least she tried to make up, for this deficit by industry and self-assertion, which, if he only had known it, were the very things that, for his sake, were best

for her to have. It is curious how a man who long has towered among men can be let down by one woman, not oversized or aggressive, only firm and ladylike. His lofty gait, exuberant gaiety, and overflowing verbosity declined in the constant presence of a wife who estimated him at his comparative conjugal value, and not much more. Alley and S'phrony were very friendly, ostensibly affectionate. Yet it cut Alley, who was more ambitious, to suspect that S'phrony felt that she had the better husband; for not until after her marriage had she learned that it was not for the want of trying that Jones had not gotten S'phrony; then she remembered, with a sting of more than one kind, how lightly, before their marriage, he had spoken of Sim, whom she now saw was regarded by everybody except Jones as the latter's superior. Her very loyalty imparted to these stings a sharper painfulness. Stimulated by her influence, Jones became much more energetic in business, and, like all such persons, hoped to recover his lost ascendancy. At the death of his mother, intestate, a year afterward, he persuaded his sister Maria to forego a property division, as they were to continue to live together. Upon this arrangement Mr. Downs expressed his opinions, but only to Sim.

"It ain't people's own fau't when they hain't the beautiful face of other people, Simyul. I know that from expe'unce, but that ain't no reason for them to be runned over, and they 'd 'a' been a fuss if any o' my people had wanted to keep me out o' *my* sheer o' *my* father's prop'ty because I were n't their equil in pooty and sizeable. As for Jones, he 's bound to be above *somebody*. He have lit off o' you, and he can't git the up-hand o' his wife, and now he have lit on to Miss M'ria. He hain't got what he expected to git by Alley, and now I suppose he think he 'll make it up out of Miss M'ria."

Miss Maria was as good as she was plain. She had great respect for her sister-in-law, but she loved best S'phrony, with whom she sometimes held chats more or less confidential.

"Brother thought it was n't worth while to have a division, as we were all together, and I did n't care about it, as I never expect to go away from there. Alley said not one word about it, no way; for she 's a good, honor'ble woman, Alley is, but it cut her sometimes, I suspicion, that brother don't make and manage equil to cousin Sim. She treats me just like her own sister, which as for brother, he hain't always done; that is, not to that extent. He know I never expect to change my condition, and so I suppose he think it ain't worth while. And then, you know, the little baby 's named Maria, which of course it 's after ma, although the same name as me, and it 's a' sweet a little thing as it can be, and it take to me a'most the

same as it take to Alley, and so on the whole I told brother, at least for the present, and till I said different, to let things stay as they are."

Things went on with reasonable smoothness for two years longer, at the end of which, after the birth of her second child, S'phrony died. It was very hard on poor Sim, who, for all he thought about it, and grieved about it, and did everything about it that is usually done in such painful emergencies, was not able to see how, if ever, the loss was to be repaired.

## VI.

IN this while everything about Mr. Downs had grown more dry, not rapidly, but perceptibly. No; there was one exception—his love for Sim.

"Been my own daughter," he said often, as tears were in his eyes, "I would n't 'a' felt more miser'ble, special for poor Simyul. The good Lord always know what 's for the best; but sech as that never struck me that way. I no doubt S'phrony have gone to mansions in the sky, for she was as good as they ever make 'em; but what poor Simyul is to do, I has yit to see."

For several months he watched and tended him closely; he waited such time as was respectful to S'phrony's memory, and then decided that in a manner as delicate as possible he would put forth a feeler.

"Simyul, M'ria Kindrick may n't be as handsome as some, nor she may n't be quite as young; but that nor them don' hender her from bein' a oncommon fine female, and I have been stud'in' on it, and my mind have arriv at the conclusion that M'ria Kindrick would make the best sort of a companion to them that has lost who they oncet had, and is left with two little motherless children."

Sim shuddered slightly; then in his heart he thanked Mr. Downs, whose motives he knew to be all kindness, for only hinting his thoughts, instead of blurting them out, as is sometimes done by people who seem to have not a particle of delicacy. He looked at his children, one waddling about on the piazza, the other in the nurse's arms, and said:

"Uncle Billy, it appears like to me that since S'phrony 's been gone I feel like I don't keer one blessed thing— that is, for myself."

"I know egzact how you feel, Simyul, though I ain't never been in them conditions, a-owin', I suppose, to my not a never havin' a wife to lose o' no sort. But if it was me, I should have my eye on them childern, a-knowin' no *man* person can always see which sech as them, inner-cept if they be, is obleeged to have."

"The good Lord know how sorry I am for

'em," and Sim looked at them with much generosity.

"Of course you are, a-bein' they 're your own childern; but a young man like you, he ought to be sorry for hisself too."

Then Sim candidly admitted that he was.

"I'm thankful for that much," said Mr. Downs, heartily, "and if it was mè, I should try my level best to requiperate, like the doctor say; I should try to polish myself up in all mod'rate ways, and let people see that I had n't give up, not by a long shot; and to save my life, I can't keep out of my head, if Jones was to divide with Miss M'ria, which, bein' his own dear sister, he's bound to do, and this side o' the plantation was to fall to her, how compack every thing would be, provided people had the mind to make it so by jindin' and nunitin' o' theirselves and it and them."

After several talks on this line, Sim lifted up his head as well as he could. It was not strange that he should drop in at the Kindricks' occasionally, and listen thankfully to what consolation the family offered. After the first outpour, Jones did little in that way; but Alley, and especially Miss Maria, were earnestly sympathetic and kind. Sim soon began to come there quite often, so often that Jones considered it necessary to say something about it. One morning at the breakfast-table he looked up from his plate and said:

"M'ria, Sim Newsome comes here oftener than I can see fit to take any stock in his travelings and in his visits."

At that moment both ladies had their coffee-cups in their hands, Miss Maria's touching her lips, and Alley's on its way. These were set down promptly, Miss Maria's so abruptly that some of its contents splashed into the saucer. She looked straight at Jones for a second or so, then rose, and left the room.

Contrariwise with Alley. Her face reddened with generous shame, and she said:

"I have heard you make many imprudent, not to say foolish and shameless, speeches, but never one equal to that."

Her disgust was so manifest that he avoided the look which she gave him, and said sullenly:

"I jest wanted to inform M'ria that Sim Newsome was not fooling nor hidwinking me, sneaking over here with his moanin' talks and conversations."

"Mr. Newsome has not been coming here in any such way, Mr. Kindrick, and if he has been coming here at all with the notion which you showed Maria that you believe, I don't see, for my life, how you could study up a better way to drive her to accept him at the first offer he makes to her."

"My Lord! for a gentleman's own wife to converse in that way, and on a subject of the

vitalest importance to him as the man of the house."

"Gentleman! Man of the house! Pshaw!" Then she rose also, and left him to himself. Going to Maria's chamber, she said:

"Maria, do please try not to mind Mr. Kindrick. I am deeply mortified; but I hope you understand your brother well enough to not let his reckless, insulting words distress you too much."

"Law, my dear child! I left the table to keep from seeing the trouble that I knew such outrageous words would give you. Cousin Sim, I don't suppose, has been thinking about me as brother hinted. But brother ought to know that if cousin Sim was foolish enough to want me, the way to make me take him would be to talk about him in that way."

"Let us kiss, and say no more about it."

And so they did.

In a case of this sort, which inevitably must grow worse if it does not grow better, and that soon, there was one of two things for a man like Jones Kindrick to do. One was to amend himself. But people like him cannot learn to yield entirely a supremacy after it has been admitted so long. When his control over Sim had ceased, he thought to transfer it to Alley. Failing here, except so far as a loyal wife will always submit to any sort of husband, he now sought to domineer over his patient sister, and we have seen what was likely to come of that. Jones, although not an old man, was too old to amend. Perhaps he had so decided in his mind. Then, not so intending, however, he took the other alternative. To make short an unpleasant recital, he went into a decline, and when he foresaw that he was not to retrace his steps, he asked Sim, as a cousin and a friend, to be as liberal as he could with Alley and the baby when division of his mother's estate should be had between them and Maria. And Sim promised solemnly that whatever influence he should have in that matter should be exerted on the line of the wishes just declared. Jones thanked him and the rest for all that they had done and promised, and then went his way.

"On the whole," said Mr. Downs, kindly, "it were as honor'ble thing as Jones could do, poor feller."

#### VII.

"No, Simyul," said Mr. Downs, feeling the sweetness which we all have when in forgiving mood, "they ain't a thing I has to say ag'inst poor Jones. He were a fine young man, if he have only knowed how to act different."

A generous man, Sim felt becoming regrets. He was touched by the appeal in behalf of Alley and her baby, and he resolved to befriend them

to the degree comporting with other claims. He had not intimated to Miss Maria that if she should choose, she might have the place left vacant by S'phrony. Once or twice, constantly stimulated by Mr. Downs and the needs of his children, he had not been very far from doing it. But, somehow, S'phrony's image or lack of ardent desire had hindered. When Jones had gotten out of everybody's way, Sim gradually began to ask himself if he were quite as sorry as he used to be; for somehow, when he was at the Kindricks', he had somewhat of a notion that Jones, wherever he was (and he sincerely hoped it was a good place), had his eye upon him. Alley behaved with entire decorum, exhibiting neither too much nor too little of unavailing sorrow. Both ladies accepted thankfully his counsels about the management of their business. Seeing how much these were needed in the comparatively run-down condition in which things had been left, he went over often, because, business man that he was, he knew it to be necessary.

This seems a fitting place to mention the somewhat changed relations of Sim and Mr. Downs toward each other. Latterly their confidential chattings had been getting into rather dwindling condition. Perhaps neither did so deliberately; but at all events they seemed to have decided simultaneously that the future, better than they, would know how to take care of itself.

Mr. Downs's land joined both properties. One day it occurred to him that the Downs-Kindrick line of fence, being rather crumbling, ought to be reset. While walking alongside he discovered an ancient mark which showed that the fence had been put by mistake on the hither side of his line. Knowing that right was nothing but right, he resolved to ride over and have a friendly talk upon the subject with one or both of the Kindrick ladies. But he did not do so immediately after making the discovery. No; he first went to town and purchased some very nice cloth and other materials, had everything cut out by the tailor, and afterward,—on that same day, bless you,—rode away up to Miss Faithy Wimpy, whom he, as well as everybody else, knew to be the best maker-up in that whole region. When all was finished and brought back, it was then that he went to the Kindricks'. Yet he did not travel by the public road, which would have taken him by the Newsome place. He rode over his own ground until reaching the fence aforementioned. This he laid down, and, after passing over, traveled on quietly and thoughtfully. The ladies were sitting on the piazza, each moderately busy at some sort of needlework, when they heard from behind the house the opening and shutting of a gate that led into the lower portion of the plantation.

"Wonder who can be there at that gate," said Miss Maria, suspending her work; "the hands ain't anywhere in that part of the plantation." Rising, she walked to the end of the piazza, and, looking back, said: "Alley, do come here. It 's Mr. Downs's horse, I *think*, but who in this world it is that 's on him, I can't tell."

The horseman came on alongside the garden and the yard. Proceeding thence to one of the trees near the gate, he alighted, hitched his beast, and, opening the gate, advanced modestly up the walk. Even then Miss Maria did n't dream who it was.

"Why, Maria," said Alley, "it 's Mr. Downs himself." And she smiled; for by this time, poor thing, she could pick up a little sprightliness.

"What in this world," said Miss Maria in low tones, "can he be coming here for, and from the back way? that is, if it 's him, which I don't—why, how d' ye, Mr. Downs? I did n't know you at first."

"You knewed *me*, Miss Maria," he answered, as he was shaking hands, "but you knewed not these strange clothes, special comin' up the back way of a sudent like."

"Might have been something in that," she answered, trying to ignore another faint smile on Alley's face.

"Come on business," he said when seated, and with many carefully selected words he proceeded to tell what it was, looking at one and the other alternately. They answered promptly that they had not a doubt of the verity of his statements, and that the fence should be made to conform to the newly ascertained line.

"Well," said the visitor, with as much heartiness as he could command, "if you two had been a couple o' men, which I 'm thankful you ain't, I 'd 'a' had to palarver and palarver about that line, and then maybe not satisfy 'em. But bein' women, it 's done settled in short order. I 'll git Simyul Newsome to ride down there with me some time soon, so he can see they ain't no doubts about it. You can trust Simyul, I know."

"Certainly," answered Miss Maria; "but we can trust you just as well, Mr. Downs."

"I 'm much obleged;" and afterward he thought of a thousand more words which he could and would have said, but that they did not occur to him until after he had left the house.

When he reached home, he gave some swift orders to his foreman, and then, after putting off his finery, and getting into his every-day things, rode straight to the Newsome's. When he got there, if it had been to save his own life, or even that of Sim, he could not have told exactly how he felt. He began as coolly as it was possible to try to assume to be:

"I 'v been over to the Kindricks' this mornin', Simyul."

"Ah? I 'm glad to hear it, Uncle Billy. I hope you found all well."

"Yes; I heard no complaint. No; I were down there by me and their fence, and I concluded I 'd peeruse on up to the house and let them females know that I acc'dental found out that the fence were n't exactly on the line betwix' us, but it run a leetle on my side. When I told 'em, they said they was perfect riconciled to have it sot right. I told 'em I 'd see you about it first, so you could see I were n't mistakened, as I could show a cross-mark on a tree plain as open and shet. They 'lowed they was willin' to trust ary one of us, me and you."

"Of course, Uncle Billy. I would have known they 'd 'a' said that. About what difference does it make?"

"I should say five acres, more or less, by the look of my eye."

"All right; when you git ready, I 'll speak to them, and they 'll help you move the fence. I 'll take your word for it."

"That 's what I sha'n't do, Simyul, and that 's what I come to see you about."

"Why, it 's nothing but right."

But in the tone of Mr. Downs and in his look was a firmness which convinced Sim that it would be useless to insist.

"No, Simyul; not with the feelin's and the respects I has for them females. You want to know what I done soon as I got home from there? I called for Sam, I did, and I told him to let the hands drap everything, and go down there and tear down that fence, and then set it up again with sound rails, top to bottom, eend to eend, on the same line as before."

"I cannot understand you, Uncle Billy."

"I don't wonder at you, Simyul, for nother can I understand myself, not square, straight up and down. But let me tell you fur as I can see down into my own insides."

Here Mr. Downs felt his eyes begin to tremble; so he turned them away from Sim, and thus proceeded:

"When I got there in the cool o' the mornin' like, and I see them couple o' fine women a-settin' there in the piazzer, busy as two bees, and it look like the bein' of a widder have improved Alley to that, I could n't but say to myself, if it was me, and I was a young man, it seem like the sight of her would perfect blind a feller's eye. And then I say to myself, what a pity! because, when the time come, and Simyul Newsome and Miss M'ria Kindrick may see it their juty to be pardners, if for nothin' else, for conven'ence, and then when the prop'ty is divided, I said to myself, I sha'n't fence in that land, but I 'll leave it right whar it is, vallible as

it is, and the timber that 's on it, I 'll leave it thar for the survivor."

"Why, law, Uncle Billy! I and cousin Maria have no such notion."

"What?" cried Mr. Downs, turning upon Sim, his eyes dancing and his face aglow with smiles. "Well, well, well! Now my mind *is* easy, Simyul, which it hain't been before not sence they told me the breath were out o' poor Jones's body for good. I knewed it were n't egzact the thing to be thinkin' about it so yearly, but the good Lord know I could n't he'p it, and I say to myself it do look like the good Lord have flung another chance in your way, after givin' up so many times to Jones, which, poor feller, I hain't nary a word to say ag'inst him, now he 's dead and goned; but facts is facts, and I am now a-talkin' to you as a man o' jedgment in this world, which no man, and I may say no nobody else, ever deparches from it tell they time come, and when it do, you can't no more hender 'em from goin' than you can hender the sun from settin', and if he ever had a wife, the said wife is then cut loose, and that for good. Why, the very 'postle Paul writ that. Of course, you know, I ain't sayin' ary thing ag'inst Jones, a-layin' where he is, and a-leavin' of a wife which for beautiful I never see but one which was beyant her; but that was before you was borned. Let that all go now."

Then with a gentle gesture he waved back the image of the love of his youth, and proceeded:

"But to begin where we lef' off. When they told me that Jones, poor feller, have give up, it flash in my mind quick as thunder that it do look like Jones Kindrick have gone away peaceable and honor'ble, and flung his widder and his innercent infant on to you, a-knowin' that you would forgive him and do the best you could by both of 'em, and special when I did think on my soul this mornin' she was pooty as a pink, spite o' all her moanin' caliker, I say to myself, there 's Simyul Newsome's chance. As for the last survivor, Miss M'ria, I 'll yit leave that line fence jest as it is."

Sim promised to ponder these words.

#### VIII.

WHEN one approaches and foresees the end of a story, detail is tiresome. Sim had promised to ponder, and he did so with entire fidelity and some rapidity. Even yet he had not parted from all sense of the vast superiority of Jones over himself, and he looked with some dread upon the attempt to be a successor to such a man; but he remembered that he had given his promise to him to aid in having justice done to his widow and child; then Alley was more

beautiful, and looked sweeter than ever before, and — yes, he was obliged to admit that he loved her. Sim Newsome, notwithstanding his humility, was a man who, when his mind was made up to do a thing, could go right along to it. So one day he went over there, and as soon as he had taken her hand and said good morning, he told her that he had come to ask if she would have him. Alley did not answer immediately, but stepped back to bring out a chair for him, and to see if Miss Maria had gone out, as she knew that she was expecting to do. It was then that, holding her eyes down, and looking at her hands folded in her lap, she answered that she would.

And now there were left Miss Maria and Mr. Downs. It would be a tedious recital of her lonesomeness all by herself in that big house, and the increased sense of it that lately had come to Mr. Downs in the smaller mansion which hitherto had been large enough to contain him and all his simple familiar things and ambitions. I could not say what influence interest in two romances had exerted upon a mind long unused to such things. But Jones

Kindrick having gotten out of Sim's way for good and all, and the latter no longer needing help to withstand his encroachings, Mr. Downs began to feel lonesome both for himself and for Miss Maria. I could not tell, because I never knew, nor did anybody else, precisely how these two got together. In the economy of the world, provision is made somewhere for all legitimate wants. We have been taught by microscopic investigation that even the protoplasm, which has neither eyes, nor mouth, nor ears, nor hands, nor feet, not inside, nor outside, yet knows how to seek and find affiliation with its kind, if for nothing else, for comfort in its solitude. By some sort of quasi-involuntary, but always friendly movements, executed in a comparatively brief time after Alley and her baby had been taken to the Newsome house, these two became one. Some people said that the continued multiplication of poor kin around them had something to do with it; but others argued that the winning card in the hands of Mr. Downs, so intended when he slipped it out of the pack, was that generous sacrifice which he had made for the survivor.

*Richard Malcolm Johnston.*

## PHYLLIDA'S MOURNING.

BLUFF overlooking the turbid, swiftly flowing river, low hills rolling away beyond, a gray sky broken by one yellow streak in the west, and hot, breathless twilight hanging over all.

A wilderness of neglected paths, some for horse and some for man, crowned the bluff, separating from one another small irregular plats the tangled grass and shrubbery of which half hid the uneven clay mounds they contained. Over the hillocks were scattered, in more or less orderly arrangement, shells and broken china and glass, footless vases stuck into the earth, the bowls of old lamps, and marble images without noses. There was even a dilapidated doll or two among the medley. One would have imagined that children had chosen the spot for "playing house" on an abnormally large scale, had it not been for its distance from all habitations, and its air of desolation.

Two figures were outlined against the sky on the edge of the bluff. The taller was that of a slim, shapely mulatto girl of eighteen, who watched listlessly the busy fingers of the small figure squatted at her feet, very brown as to face, hands, bare legs, and curtailed gown. The only high lights in this sketch of nature were the whites of the eyes.

The child was planting a slip of geranium in a broken-spouted tea-pot of the Rebecca-at-the-well brand. "What mus' I name it, Phyllida?" she asked, pressing down the earth around the green stem. "I 'm 'bliged to name it to make it grow good."

"Name it de 'Miss Lucy,' I reckon," said Phyllida, with a sigh so deep that it was almost a groan; "ol' Mis' give it to yo'. She would n' 'a' give it to me." She stooped and, taking the tea-pot, placed it carefully in a commanding position at the head of one of the low mounds, where it overlooked a happy combination of three tea-cups, a water-pitcher without a handle, a blue glass pickle-dish, two lamp-stands, and some broken vases. As she rose, she stepped back a pace or two to get the full effect, while an expression of satisfaction slowly dawned on her face.

"Dere now," she said, "dere ain' no prettier grave in de cemet'ry. Dey 's mo' t'ings on Sis' Charlotte's grave," pointing to an adjacent mound where a rusty tin coffee-pot and a large red-and-white-flowered bottle such as barbers use for bay-rum stood guard over the smaller articles that covered it entirely, "an' dey 's bigger t'ings on Unc' Joshua's," indicating a certain conspicuous white object in another direction, "but I would n' put no slop-jar on, don' care if did have a blue ban'. We on'y

got t'ings Mr. Brown love while he was 'live. I ain' dat kin' to stick t'ings on fo' show."

"Would n' all de bottles he done took de med'cine out'n look fine, Phyllida?" suggested the little sister. "Dey 's right smart of 'em."

"An' make it jus' like Brer Hayne's grave over dere?" said Phyllida, pointing the finger of scorn at a rough inclosure of barrel-staves and old wire, so slight that a stray calf might have knocked it down, but the small gate of which was carefully secured with a large padlock. Twelve medicine-bottles symmetrically adorned the one mound within, five on each side, one at the head, and one at the foot, all bearing the legend clearly blown in the glass, "Smith's Never-Failing Cure."

"No; I ain' got no trash on Mr. Brown's grave," continued Phyllida. "I gi' 'im de bes' I got in de house—seem like it 's all I *can* do," she added, turning away with a farewell glance of mingled pride and pathos.

"'Clar' to gracious, Phyllida," said the brown morsel, looking apprehensively over her shoulder as they walked on, "it 's gittin' pow'ful dark."

"All de better," returned the other, gloomily. "A widder dat has to wear a calico wid as many colors as Joseph's coat better go to de cemet'ry after dark."

Superstitious terror of the place was too strong for the child, however, and a cold shiver ran over her. She slipped her hand into her sister's. "I would n' 'a' come in de firs' dark fo' no one but you, Phyllida," she said quaveringly, "an' de black dark a-comin'. Heap better go early in de mo'nin'—nobody 'll see you den."

"Seem like de *trees* 'u'd be 'bliged to laugh at a widder wid no crape," said Phyllida, despairingly, stopping before a grave they were passing. The underbrush grew thickly over it, almost concealing a crockery wash-bowl, half filled with drifted pine straw, on which lay a rubber rattle and two little worn baby shoes, weather-beaten and shriveled by many storms.

"Dat was Sis' Nanny's baby; 'member dat baby, Nonsense?" The brown shadow had been christened Narcissus, but every-day use had shortened the name into a most inappropriate title for so grave a personage. "Sis' Nanny she put on crape fo' dat chile like 't was her husban'—a little no-'count baby!" Phyllida punctuated the sentence by walking on, greatly to her sister's relief. "An' when Brer Sampson die, look at de fun'al," she continued. "All de 'Gospel sisters' wid white hats an' crape ban's, an' de 'Chil'ren of Jerusalem' wid black hats an' white ban's, an' all wid deir society handkerchiefs—tell you, 't was mighty fine. An' de widder in de deepes' mo'nin'. An' was n' de Rev'end Mr. Brown as great a preacher as Brer Sampson, jus' yo'

tell me? Did Brer Sampson ever preach a sermon like dat one Brer Brown preach, 'bout de works of nature? Don' you 'member, Nonsense, how de No'the'n gen'l'man dat hear him write it all down? Don' you 'member how he draw himself up, an' whack de big Bible, an' say, 'O my bredren, we could any of us make de bumblebee, *but who could put on de yaller fuzz?*' An' here is Brer Brown's widder, dat ought 'a' be holdin' up her head in a crape bonnet and veil, sneakin' roun' in de dark to de cemet'ry, 'fraid to meet up wid somebody."

"I would n' min'," urged her faithful consoler, stoutly. "Brer Brown had a mighty fine fun'al, I hear ev'ybody say. De white preacher come—"

"Mighty fine fun'al, sure 'nough," interrupted Phyllida, "an' de widder 'bliged to hide in de back room 'cause she got no mo'nin'!" The play of "Hamlet" with *Hamlet* left out would have been the only adequate comparison to Phyllida's mind, had she but known it. "De mo'nin' 's de bigges' part of it, chile. When ole Unc' Paulus die, Aunt 'Liza mighty po'ly—so po'ly she can' git out'n de bed. An' she put her mo'nin' bonnet an' veil an' black gloves on, an' set up in de bed an' see ev'ybody. If ol' Mis'—"

"I done ask ol' Mis', like you tell me," said the child, wistfully, "an' she say —"

"Oh, I know what she say well 'nough. Ol' Mis' ain' never forgive me yet," said Phyllida, with a groan, and they went on their way in silence to the cabin that they called home.

It was on the "outside skirts" of town, Aunt Clotilda said. The girls' parents lived in it, and had given Phyllida one of its three rooms when her husband's paralytic stroke had forced him to quit preaching and become dependent on his newly married wife. Phyllida had worked her slender young fingers to the bone for him. She had taken in washing until her strength failed her for such heavy work; she had gone out sewing, cooking,—doing anything she could find,—to return at night to her half-helpless charge, whom his disease had made imbecile, and to care for him like a baby.

"Ol' Mis'" had given her scant help. "Phyllida," she had said to her two years before, when the girl of sixteen had been so flattered by the attentions of the aging preacher, and so proud to become his third wife—"Phyllida, I have told you once and again you are worse than foolish to think of marrying that old man. A preacher is not an angel, though you all seem to imagine so, and he is obliged to grow old like any other man. Does his being a preacher make him any younger? I tell you plainly, Phyllida, if you marry that old man, you must not expect me to do anything for you."

Phyllida had burst into tears, begged Mrs. Rutledge to forgive her, left the house, and married her preacher.

Mrs. Rutledge had relented sufficiently toward her favorite handmaiden, the daughter of one of her former slaves, to send her a substantial wedding present, but that was all. Phyllida did not dare go to see her, nor did she ever send for Phyllida. The fact that she took the younger daughter, Narcissus, and proceeded to train her up to fill her sister's place argued nothing more than that she preferred to have around her the "old-fashioned" kind of negroes, as she phrased it, respectful and docile, as any children of Aunt Clotilda were sure to be. Mrs. Rutledge had small patience for the class of flippant, impertinent young colored girls who announce a negro huckster to the mistress as a "gen'l'man who wants to see yo'," and refuse to live in a house where they cannot "call colored people ladies, and white folks *women*."

Narcissus lacked the cleverness and good looks of her sister, but she was quiet and industrious, at least. If Mrs. Rutledge revived the time-honored rule, relaxed in favor of the trustworthy Phyllida, of requiring a continuous whistling to be kept up while the raisins were being stoned for fruit-cake, it was not that she really doubted the child, but thought it as well to take precautions. Narcissus could whistle like any mocking-bird, and these involuntary concerts gave pleasure to everyone who overheard them. "Only Nonsense stoning raisins," Mrs. Rutledge would explain, with a quiet smile, to any visitor who remarked the music in the air.

As months went by, Narcissus so grew in favor that her mistress began to have a comically irreligious dislike to her going to church, fearing that a taste for preachers might run in the family. But Narcissus was too young to develop ministerial tendencies yet. The whole wealth of her heart was lavished in dog-like devotion upon her pretty, unlucky elder sister, who worked so hard for the helpless old man and had so little pleasure. I cannot say Nonsense was sorry when Brer Brown died. Her chief concern was Phyllida's sorrow that she had no mourning to wear for the much-revered preacher husband. Brer Brown had belonged to one of the colored burial aid societies, which provided for his funeral; but the little means of the family had been exhausted during his long illness, and even debts incurred that rendered any further outlay impossible.

In despair, Phyllida had instructed Nonsense to apply to "ol' Mis'," as if of her own motion, for the loan, just for the funeral, of the bonnet and veil which Mrs. Rutledge had herself worn during the first year of her widowhood, and which now lay unused. Mrs. Rutledge

had responded dryly that Phyllida's husband's departure was not to be mourned, and she would lend no countenance to such a proceeding. So Phyllida, attaching an overstrained importance to the matter, had hidden herself during the funeral, and refused to appear at church afterward, or even on the street, except after dark.

Meanwhile the devoted Narcissus silently turned the question over and over in the depths of her loving soul, and failed to discover any expedient, except one, before which she stood aghast at first. Her sense of meum and tuum was rather undeveloped, like that of many of the formerly enslaved race, but their sins are principally in the line of coveted food, and clothing is another and more awful matter. Yet there lay that bonnet and veil, and an old black gown besides, of no use to any one, in a trunk without a lock in the empty room at "ol' Mis's," and Narcissus could lay her little brown paws on them at any moment. "Ol' Mis'" would be very angry, to be sure, if ever she found it out, and "ol' Mis'" had been very good to her; but how had she treated her dear Phyllida? The small heart hardened.

She walked to her work the next morning with her usual companion, a "bright mulatto" girl, who, like herself, was a servant in one of the city families, and, following the Southern custom, went to her own home every night. Narcissus had much respect for her opinion, as that of an individual some years older than herself who had had the proud distinction of one term and a half at the "university."

"Lily," she said hesitatingly—"Lily, what you reckon 't is to steal?"

"Oh, go 'long, you no-'count nigger," returned Mentor, jocosely. "'T is mighty wicked to steal; dat 's all I know about it."

"Sutney 't is so," assented Narcissus; "but what yo' reckon 't is to steal? Takin' other folks's t'ings fo' yo'se'f?"

"'T ain't takin' your own t'ings, I reckon," said Lily, smartly, with a toss of the head.

"But 'lowin' yo' wants 'em mighty bad—'lowin' yo' *needs* 'em? Is dat stealin'?"

Lily scratched her head meditatively.

"An' 'lowin' dey is n' fo' yo'se'f at all, dat can' be sure 'nough stealin'?" continued Narcissus, anxiously.

The strain was too much for Mentor's patience and theological knowledge, and she changed the subject.

"Here come I on my two chips,"

she began to sing airily,

"Who 's goin' to kiss my ruby, ruby lips?"

"Nonsense, what you t'ink I heard Sunday evening? Bob Sims was inquiren' if 't was any use to try to fly roun' your Phyllida."

"Fly roun' our Phyllida?" repeated Narcissus, in dismayed perplexity. "Phyllida 's a widdler."

"Huh," said Lily, "dat 's it. I dunno wha' fo' all de men is plum' crazy after de widders. Bob Sims say he 'd be mighty proud of de chance, sure 'nough. Den Ike Buzzard, dat nigger f'om de sand-hills, say he got no show-ance; he picked out dat Phyllida fo' himself. Den Bob Sims say de lady, Rev'end Mrs. Brown, might have a word herself to say 'bout it. 'I hope,' he say, 'dat you have n't de least conception dat I t'ink you 're a gen'l'man, speakin' dat way 'bout a lady.' An' he hol' his head up mighty gran', an' walk off."

Narcissus listened to the recital of this thrilling episode with wide-open eyes and mouth. Before she could enter further protest against regarding her sister in any other light than that of a permanent widow, however, Lily arrived at her bourn, and disappeared in the gateway of one of the large old houses, with wide galleries half hidden in green luxuriance, that lined the shady street.

Narcissus went on a block farther, to the Rutledge place. It was a mansion-house of ante-bellum days, whose ample, vine-hung porch, two-storied verandas, and wide encircling old-fashioned garden, its paths outlined with tall hedges of box, gave it a grand air that such trifles as weather-worn paint, a broken step, or a paling or two gone from the fence, failed to disturb. She went in, and entered upon her day's work, but with a languid air which was not natural to her. It attracted Mrs. Rutledge's attention. "*Do*, don't be so slow, Nonsense," said she once. "Are n't you well, child?"

"Yes, Miss Lucy," returned Narcissus, ambiguously; and she made a desperate spurt for a moment, and then was slower than ever. The day was so oppressive, there was such an unspeakable dullness in the air, that after all it was not to be wondered at, Mrs. Rutledge thought.

The breathless morning wore itself out at last, and the still more breathless afternoon succeeded it. The glowing sun dropped wearily into the west, lighting up the fires of a gorgeous sunset. Mrs. Rutledge remarked it, as she sat in the great hall, where the doors at each end stood open in order that the draft might draw what air there was to be caught through the screen of rose-vines. It was usually comfortable here, even in the fiercest weather, but to-day not a fold of her voluminous white wrapper stirred.

"Oh, Nonsense!" she called from her rock-  
ing-chair.

"Yes, Miss Lucy," said Narcissus, appearing shadow-like in the doorway.

"Be sure you open the blinds up-stairs before you go."

"Yes, Miss Lucy," said Narcissus again, and slipped noiselessly up the ancient staircase running around three sides of the hall.

Mrs. Rutledge rooked on. A neighbor came in to chat for a few minutes, which prolonged themselves into the twilight before she took leave. "Do wait a moment," said Mrs. Rutledge. "I'll have Nonsense gather some figs for you. Oh, Nonsense!"

But no Nonsense answered. Mrs. Rutledge called again.

"We won't wait on her. She must have gone home," she said at last, rising ponderously, with a little sigh, "though I scarcely remember her coming down-stairs. Let me take you out into the yarden, where you can help yourself." And they passed out through the glass doors, under the great rose-vine, where a few summer Larmarques hung, white and beautiful, down the broad steps into the old-time garden.

The fire had long since burned itself out in the sky, and the darkness settled down, close, brooding, and sultry. Up-stairs in the empty room a little brown heap, fast asleep behind the trunk that contained the coveted bonnet, failed to wake when the first darkness would have covered a soft retreat. And the dull evening dragged on.

Something waked Narcissus at last. It might have been the continuous distressed lowing of the cow, or the wild barking of dogs, or the excited crowing of cocks far beyond the usual nocturnal serenade. It might have been the rumbling of a heavy train of cars on the railroad track near the house. In any case, her cramped position recalled to her instantly where she was, and the darkness warned her she had overslept. She sprang up and opened the trunk, while that portentous train came nearer and nearer.

Was the lid bewitched that it shook so in her hand? Every negro knew the old Rutledge place was haunted. Perhaps she was stealing, after all, and the ghost was going to appear to punish her. If she only had her daddy's graveyard rabbit-foot! But could a ghost shake the whole room till the windows rattled? What was happening?

With one spring, the child, clutching the ill-omened bonnet, landed in the entry, and essayed to go down the stairs. They rolled from side to side, like a ship in a storm, and the lighted lamp in the hall swung to and fro, pendulum-wise. The walls seemed to beat her against the balusters, and the balusters to toss her back against the walls, a helpless shuttlecock between two battledores. She threw the bonnet on her head, and clung to the rail, shrieking aloud in terror. From the negro settlement in the hol-

low below the house floated up cries of "Lohd, hab mercy!" and more inarticulate screams and howls of despair.

"'T is de Judgmen' Day!" gasped Narcissus, reeling down the rocking stairs, and falling at the feet of her mistress, who came hurrying from her chamber at that instant. The little brown figure, crowned by the preposterous bonnet with its veil trailing on the floor, clasped her knees with the strength of desperation and would not relax its hold.

"De Judgmen' Day! de Judgmen' Day!" she sobbed. "Sen' it away, Miss Lucy! sen' it away! It done come 'cause I so bad—I 'll never steal no mo'. Do sen' it away!"

"Let go, child," said Mrs. Rutledge, sharply, freeing herself by force. "We must get out of the house; it's an earthquake!"

But the event was equally terrifying, whatever name it bore, and Narcissus's knees gave way under her, so that she was dragged, rather than led, over the door and to the brink of the long flight of steps. Her foot caught in the long veil, she lost her balance and fell, jerking her hand from Mrs. Rutledge's grasp. Down, down, she went, over and over, wound and wrapped and twisted in the length of the fatal veil, striking each separate stair with a distinct thud, till she reached the bottom. Then dead silence.

Mrs. Rutledge, her eyes dazzled by coming from the lighted house, looked off into the darkness, and saw nothing. "Nonsense," she cried anxiously, "where are you?"

She descended by a more stately stepping than her handmaiden. "Narcissus!" she called again, as she set foot on *terra firma*, which now once more merited the name. Fright made her voice hoarse and unnatural.

Something low and dark raised itself up painfully before her. As her eyes became accustomed to the night, she could dimly discern her small servant kneeling at her feet with clasped hands, a little Samuel in bronze.

"Heah, Mars' Angel Gabriel," said she, solemnly.

"Narcissus!" said Mrs. Rutledge once more, fearing the fall had shaken the child's wits as well as her body.

"Heah I am, Mars' Angel Gabriel," repeated Narcissus in the same awe-struck tone, raising her eyes to the tall white figure looming over her. Mrs. Rutledge had been forced to appear on the scene in a somewhat impromptu costume. "O good Mars' Angel Gabriel, I *did* reckon 't was n't plum' stealin' when 't was for Phyllida, but now I s'pect it was. I never—"

"Nonsense!" cried Mrs. Rutledge, giving her a little shake. "Don't you know me?"

What are you talking about? What did you have on your head in the hall?"

Narcissus started as the voice became once more familiar to her. She stooped and felt about on the ground for something which she at last found and held up toward her mistress—a something battered and shapeless, from which a long ragged tail dangled dismally.

"Dis!" she said.

All the tragedy of the crime that thwarts its own ends was in her tone.

Some months afterward, one bright afternoon when the great earthquake was a thing of the past, a light tap sounded at the door of Mrs. Rutledge's room.

"Come in," she said. There was a slight hesitation, and then, to her surprise, Phyllida entered,—a transformed, glorified Phyllida, whose fresh crape bonnet and veil framed in a face bewitching with suppressed excitement. Her long eyelashes swept the dark-olive cheek with a certain demure consciousness, and betrayed the radiance of the downcast eyes.

"Phyllida! I had no idea it was you," said Mrs. Rutledge, not unkindly, though a remnant of her old deep-seated wrath at the notion of mourning for Brother Brown stirred in her breast.

"Howdy, Miss Lucy?" said Phyllida, with some traces of embarrassment. "How's all?"

"We're right well. I know you are all well at home, or Nonsense would have told me."

"We're to'ble," said Phyllida, fingering her handsome black dress with nervous hands.

"I suppose you have come to show me your new mourning?" said Mrs. Rutledge, relenting somewhat, touched by the girl's evident discomfort. "It becomes you, Phyllida. How did you contrive to get it?"

"My husban' give it to me, Miss Lucy," said Phyllida, without raising her eyes.

"*Your husband!*" echoed Mrs. Rutledge, not without a blood-curdling premonition of a new species of ghost-story.

"Yes, Miss Lucy. Bob Sims. He was married to him last Saturday. He give me de mo'nin' fo' a weddin' gif'. I tol' Nonsense not to tell yo'. I wanted to surprise yo'. I thought yo' 'd be please dis time?"—pleadingly.

Mrs. Rutledge was silent for a moment as she bent her head over her work. Then she said, her voice tremulous with some sort of emotion, "Phyllida, I—I congratulate you. There can be no doubt that such a considerable bridegroom will make a good husband."

And Nonsense, standing in the doorway, shadowlike but triumphant, felt that the awful memory of the night of the earthquake was the one flaw in the splendor of this scene.

## TOPICS OF THE TIME.

A New Edition of  
"The Century's" Cheap-Money Papers.

IN compliance with many requests for an edition in larger type and more enduring form, the articles on "Cheap-Money Experiments," which appeared originally in this department of *THE CENTURY*, and were afterward collected and republished in a pamphlet, have been again republished by The Century Co. in an attractive volume. It is printed in large, clear type, and neatly bound in cloth. Some additional chapters, which have appeared in *THE CENTURY* since the publication of the pamphlet, have been added. In its amended form the book is, even more than the pamphlet was, a compact and comprehensive handbook of the most notable attempts which have been made in past and present times to attain State or national prosperity by making money "cheap and plentiful." No similar compilation is to be found in the whole range of economic literature.

In calling attention to this new publication of the "Cheap-Money" articles, it is pleasant to record the fact that since their first publication a death-blow has been formally administered to the Free-Silver heresy, which, in many respects, was the most dangerous "cheap-money" delusion that ever confronted the American people.

In writing about the evils which free silver coinage would entail, in *THE CENTURY* for May last, we said:

No great party in the United States, in national convention assembled, will dare make itself responsible for the distress that would fall upon the masses of our population from free and unlimited silver coinage.

The national conventions of the two great parties have verified this prediction by putting into their platforms such explicit declarations against free silver coinage as to eliminate the question completely from the campaign. After their action it is safe to say that the danger of the free and unlimited coinage of a debased silver dollar has passed away, probably forever. The question has been taken out of politics, and it would be well for the country if all other financial questions could be taken out with it. In a thoughtful, intelligent, and patriotic address which he made on "The Silver Question in its Relations to Legislation," before the Iroquois Club of Chicago, in March of last year, Mr. James Herron Eckels stated this point in words which we cannot do better than quote as summing up accurately and forcibly the only sound view to be taken:

I am not unconscious of the fact that in and of itself this question has no place in politics. Under right and proper circumstances, its solution belongs to the professed financier, and not to the professed politician; but, unfortunately, those circumstances do not now surround it. Through an error that in the past has been costly, and in the future bids fair to be fraught with disaster, it has been taken out of the list of business issues and thrust among those of a political character; and with regard to its political bearing rather than with reference to its effect upon the material interests of our country, it is being presented to the people.

The French Assignats and Mandats.

It would have been reasonable to suppose that the experience which France had with cheap money under John Law's guidance in the early part of the eighteenth century, as described lately in these columns, would have imparted a lesson not soon forgotten. But such was not the case. Before the end of the century a new and not dissimilar experiment was made in the same direction, ending, like its predecessor, in failure and almost boundless confusion and disaster.

One of the first and most serious troubles which confronted the republic established by the French Revolution of 1789 was the scarcity of money. This was due to many causes, but chiefly, says Thiers, to the "want of confidence occasioned by the disturbances." The same authority adds the following general truth about circulation, which is applicable to all countries and in all times: "Specie is apparent by the circulation. When confidence prevails, the activity of exchange is extreme; money moves about rapidly, is seen everywhere, and is believed to be more considerable because it is more serviceable: but when political commotions create alarm, capital languishes, specie moves slowly; it is frequently hoarded, and complaints are unjustly made of its absence." To increase the supply of circulating medium, it was proposed that the National Assembly issue paper money based on the Church lands which had been confiscated by the Government. These lands were yielding no revenue, but were a heavy burden. The money, to be called assignats, was really a form of titles to the confiscated lands; for it was receivable in payment for them, and was designed, in addition to furnishing revenue to the Government, to bring about a distribution of those lands among the people. The debates of the National Assembly upon the proposition showed that John Law's experiment had not been entirely forgotten. There was strong opposition, but it was overcome by arguments that bear a curious resemblance to some which are heard in our day in favor of various forms of cheap money which are advocated for the United States. "Paper money," said one of the advocates of the assignats, "under a despotism is dangerous; it favors corruption: but in a nation constitutionally governed, which takes care of its own notes, which determines their number and use, that danger no longer exists." How like that is to the argument heard here, and in the Argentine Republic as well, that a great and rich and prosperous and free nation could make its own economic laws, invent its own monetary systems, and even defy the teachings of all other nations with entire safety! These curious arguments carried the day in the National Assembly, and a first issue of assignats, to the value of 400,000,000 francs, was issued in December, 1789. They bore interest, and were made payable at sight, but no interest was ever paid, and subsequent issues had no interest provision. The first issue represented about one fifth of the total value of the confiscated lands.

Yet with this solid basis of value upon which to rest,

the assignats never circulated at par. A few months after the first issue, demands began to be made for a second issue, as is invariably the case in all experiments of this kind. Talleyrand opposed the second issue in a speech of great ability, many of whose passages have passed into economic literature as model statements of fundamental monetary principles. "The assignat," he said, "considered as a title of credit, has a positive and material value; this value of the assignat is precisely the same as that of the land which it represents: but still it must be admitted, above all, that never will any national paper be upon a par with the metals; never will the supplementary sign of the first representative sign of wealth have the exact value of its model; *the very title proves want, and want spreads alarm and distrust around it.*" And again: "You can arrange it so that people shall be forced to take a thousand francs in paper for a thousand francs in specie, but you never can arrange it so that the people shall be obliged to give a thousand francs in specie for a thousand francs in paper." Still again: "Assignat money, however safe, however solid, it may be, is an abstraction of paper money; it is consequently but the free or forced sign, not of wealth, but merely of credit." In answer to the arguments of Talleyrand, the most effective, because most "taking," argument, if argument it can be called, was the following by Mirabeau: "It is in vain to compare assignats, secured on the solid basis of these domains, to an ordinary paper currency possessing a forced circulation. They represent real property, the most secure of all possessions, the land on which we tread."

The advocates of money based on lands who are heard in our country to-day will recognize their own doctrine in this resounding phrase of Mirabeau. It carried the day in the National Assembly, and in September, 1790, a second issue of assignats, to the value of 800,000,000 francs, bearing no interest, was ordered.

The decree for this second issue contained a pledge that in no case should the amount of assignats exceed twelve hundred millions. But the nation was drunk with its own stimulant, and pledges were of no value. In June, 1791, a third issue of 600,000,000 was ordered. This was followed soon afterward by a fourth issue of 300,000,000, and by a new pledge that the total amount should never be allowed to exceed sixteen hundred millions. But this pledge, like two others that had been made before it, was broken as soon as a demand for more issues became irresistible. Fresh issues followed one another in rapid succession in 1792, and at the close of that year an official statement was put forth that a total of thirty-four hundred millions had been issued, of which six hundred millions had been destroyed, leaving twenty-eight hundred millions in circulation.

Specie had disappeared from circulation soon after the second issue, and the value of the assignats began to go steadily and rapidly downward. Business and industry soon felt the effects, and the inevitable collapse followed. Ex-President Andrew D. White, whose tract, "Paper Money Inflation in France," is the most admirable and complete statement of this experience which has been published, says of the situation at this stage:

What the bigotry of Louis XIV., and the shiftlessness of Louis XV., could not do in nearly a century, was accomplished by this tampering with the currency in a few months. Everything that tariffs and custom-houses could

do was done. Still the great manufactories of Normandy were closed; those of the rest of the kingdom speedily followed, and vast numbers of workmen, in all parts of the country, were thrown out of employment.

In the spring of 1791 no one knew whether a piece of paper money, representing 100 francs, would, a month later, have a purchasing power of 100 francs, or 90 francs, or 80, or 60. The result was that capitalists declined to embark their means in business. Enterprise received a mortal blow. Demand for labor was still further diminished. The business of France dwindled into a mere living from hand to mouth. This state of things, too, while it bore heavily against the interests of the moneyed classes, was still more ruinous to those in more moderate, and most of all to those in straitened, circumstances. With the masses of the people the purchase of every article of supply became a speculation — a speculation in which the professional speculator had an immense advantage over the buyer. Says the most brilliant apologist for French Revolutionary statesmanship, "Commerce was dead; betting took its place."

In the early part of 1792 the assignat was 30 per cent. below par. In the following year it had fallen to 67 per cent. below par. A basis for further issues was secured by the confiscation of lands of emigrant nobles, and a flood of assignats poured forth upon the country in steadily increasing volume. Before the close of 1794 seven thousand millions had been issued, and the year 1796 opened with a total issue of forty-five thousand millions, of which thirty-six thousand millions were in actual circulation. By February of that year the total issue had advanced to 45,500,000,000, and the value had dropped to one two-hundred-and-sixty-fifth part of their nominal value. A note possessing it was worth about \$20 of our money was worth about six cents.

The Government now came forward with a new scheme, offering to redeem the assignats, on the basis of 30 to 1, for mandats, a new form of paper money, which entitled the holder to take immediate possession, at their estimated value, of any of the lands pledged by the assignats. Eight hundred millions in mandats were issued, to be exchanged for the assignats, and the plates for printing the latter were destroyed. Six hundred millions more of mandats were issued for the public service. At first the mandats circulated at as high as 80 per cent. of their nominal value, but additional issues sent them down in value even more rapidly than the assignats had fallen, and in a very short time they were worth only one thousandth part of their nominal value. It was evident that the end had come. Before the assignats were withdrawn, the Government resorted to various expedients to hold up their value by legislative decrees. The use of coin was prohibited; a maximum price in assignats was fixed for commodities by law; the purchase of specie was forbidden under penalty of imprisonment in irons for six years; and the sale of assignats below their nominal value was forbidden under penalty of imprisonment for twenty years in chains. Investment of capital in foreign countries was punishable with death. All these efforts were as futile as similar efforts had been in John Law's time. The value of the assignats went steadily down. Bread-riots broke out in Paris, and the Government was compelled to supply the capital with provisions. When the mandats fell, as the assignats had fallen before them, the Government was convinced that it was useless to try to give value to valueless paper by simply printing more paper and calling it by another name; and on July 1, 1796, it swept away the whole mass by issuing

a decree authorizing everybody to transact business in any money he chose. "No sooner," says Mr. McLeod, in his "Economic Philosophy," "was this great blow struck at the paper currency, of making it pass at its current value, than specie immediately reappeared in circulation." In commenting upon this second experience of France with paper money, which lasted for about six years, Prof. A. L. Perry, in his "Elements of Political Economy," thus graphically and truthfully sums up the consequences:

The distress and consternation into which a country falls when its current measure of services is disturbed and destroyed, as it was in this case, is past all powers of description. The prisons and the guillotine did not compare with the assignats in causing suffering during those six years. This example is significant because it shows the powerlessness of even the strongest and most unscrupulous governments to regulate the value of anything. The assignats were depreciating during the very months in which Robespierre and the Committee of Public Safety were wielding the power of life and death in France with terrific energy. They did their utmost to stop the sinking of the Revolutionary paper. But value knows its own laws, and follows them in spite of decrees and penalties.

#### Campaign Blackmailing of Government Clerks.

MR. THEODORE ROOSEVELT, speaking in the name of the National Civil Service Commission, issued a timely warning in the July "Atlantic" against all levying of assessments upon governmental employees during the presidential campaign. He wrote with characteristic plainness and force, and set forth both the law in the case and the attitude of the Commission toward offenders with such clearness that his utterance cannot fail to have a restraining influence upon all persons tempted to violate the statute.

As he pointed out, the law seeks to provide both for the protection of the office-holder and for the punishing of the politician who seeks to get from him a portion of his salary. It provides, under heavy penalties, that no office-holder shall in any way solicit or receive assessments or contributions for political purposes from any other office-holder; that no person, office-holder or otherwise, shall solicit such contribution in any federal building; that no office-holder shall in any way be jeopardized in his position for contributing or refusing to contribute, as he sees fit; and that no office-holder shall give any money to another office-holder for the promotion of any political object whatever.

It is well to give these provisions the widest possible publicity at this time, in order that all men may become familiar with them and act accordingly. Mr. Roosevelt gives emphatic assurance that the Commission will protect all office-holders whose positions are threatened because of refusal to contribute, and will ask the indictment and recommend the dismissal of all superiors in the service who attempt any intimidation of subordinates. He invites complaints of all instances in which contributions are solicited, promising to treat them as confidential and to endeavor to punish the guilty person without revealing the identity of the informant. He also declares that it is the intention of the Commission during the present campaign, whenever it finds an individual or an organization trying to assess Government office-holders, publicly, through the press, to call the attention of everybody to what is being done,

and to invite any information which will enable the Commission to prosecute the offenders.

In regard to the practice which has prevailed in some recent campaigns, of sending circulars from State or National committees to the private residences of office-holders, instead of to the public buildings in which they are employed, thus evading the letter of the law, while violating its spirit, Mr. Roosevelt says the Commission will also call public attention to every case of this kind which it discovers, and will assure all Government employees that they can disregard all such appeals without fear of losing their places.

These are all public-spirited purposes, and no one familiar with Mr. Roosevelt will doubt that he will adhere to them with vigor and determination. The practice is an abominable injustice, and ought not to be allowed in a single instance. It does not prevail to anything like the extent to which it was carried before the present law was enacted, but the evil is by no means abolished. Fear of loss of place, or chance of promotion, impels many a clerk to give who would never contribute a penny could he feel assured that his refusal would have no effect upon his tenure or prospects. The hardship which such extortion entails is pictured vividly, but with entire truthfulness, by Mr. Roosevelt in the following passages:

Government employees, as a whole, are hard-working, not overpaid men, with families to support, and there is no meaner species of swindling than to blackmail them for the sake of a political organization. The contribution, moreover, is extorted from them at a time when it is often peculiarly difficult for them to pay. To take away two per cent. of a man's salary just at the beginning of winter may mean that he will have to go without a winter overcoat, or his wife and children without the warm clothing which is almost a necessity.

Moreover, it is the poorest and most helpless class who are most apt to be coerced into paying. In several investigations undertaken by the Commission, we found that it was women who were most certain to pay, and that the women opposed in political faith to the administration were even more apt to pay than the others.

Can any self-respecting person read that and not flush with indignation that such things are possible under a free, popular government? Could there be a meaner or more despicable business for a man or a party to be engaged in than this levying of political blackmail upon hard-working, deserving, and poorly paid men and women? Mr. Roosevelt is right in thinking that publicity will be a powerful weapon to use against all men caught in this business. The American people would be made of poor stuff indeed if they did not arise in wrath against such unworthy specimens of their race. The abuse has been tolerated only because the public attention has not been aroused to it. Let us have the names of the offenders, and specifications of their offenses, published to the world, no matter how high they may stand in official life, and the thorough extermination of the evil will be soon accomplished.

Mr. Roosevelt gives a valuable hint to the extortioners, at the close of his article, by reminding them that in case of a defeat of their party at the polls in November, it will be much easier to obtain evidence against them from their victims after election, than it would be were the party to succeed.

## OPEN LETTERS.

### The Crisis of the Civil War.

AT the celebration of the opening of the Northern Pacific Railroad, of which I was at that time the general manager, two of the guests present were President Chester A. Arthur and Secretary of War Robert Lincoln. Mr. Lincoln sent for me with a request for a brief interview, and stated that he desired information upon a subject that had elicited much discussion, and upon which a careful examination of the war records, both of telegrams and letters, failed to throw any light. He said that upon entering his father's room one morning, just after the battle of Gettysburg, he found him in great distress, and upon inquiring the cause, the President stated that information had just been received from General Haupt that General Meade had no intention immediately of following up his advantage; that he intended to rest for several days; that without an immediate movement of the army the enemy would be permitted to cross the Potomac and escape; that the fruits of victory would be lost and the war indefinitely prolonged. He asked if I had sent any letters, telegrams, or other communications in which this information had been given.

I replied that I had communicated such information either to the President or to General Halleck, but in what way I could not then remember.

Two years ago I commenced to write the memoirs of the operations of the Military Railroad Construction Corps, and in one of my letter-books found a full and satisfactory explanation. From this it appears that after spending the forenoon of Sunday, the day following Lee's retreat, with General Meade, I took an engine the same evening and repaired to Washington and as early as possible on Monday morning made personal report to General Halleck; informed him of the situation and the conclusions I had reached, that, unless General Meade could be induced to change his plans and move immediately, the enemy would certainly cross the river and escape. It was, no doubt, immediately after this interview that General Halleck called on the President and communicated the information that gave him so much distress.

The President and General Halleck have been severely criticized in some quarters for the words of censure sent to General Meade, which, it was claimed, did injustice to a gallant officer who had performed services of the highest value. Certain it is that the predictions in regard to the escape of Lee were verified: he was not disturbed for ten days; he crossed the Potomac July 14, 1863, and the war, which, in my opinion, might have been then substantially ended, was prolonged for two years with immense sacrifice of blood and treasure.

As the battle of Gettysburg was the turning-point in the great struggle, and as antecedent events with which no one now living is familiar except myself had apparently an important influence upon the result, my friends insist that it is a duty to place certain facts on record.

The position that I held in 1862 and 1863 was that of Chief of the Bureau of Military Railroads, charged with the duty of constructing, reconstructing, and operating all railroads used by the Government in the active operations of the war, but especially in Virginia, Maryland, and Pennsylvania, where I directed operations personally. I reported directly to the Secretary of War and to General Halleck, but necessarily kept in constant communication with the general in command of the army in the field, that I might know his plans, his requirements in the way of transportation, and the lines to be operated upon.

When Lee was moving toward the Potomac for the invasion of Pennsylvania, I supposed as a matter of course that General Hooker would follow him up and that, as a necessary consequence, the base of supplies must be changed and the rolling-stock transferred from the line of the Orange and Alexandria to the Baltimore and Ohio Railroad. I went to the front to consult with General Hooker, and found him under a tree two miles from Fairfax Station.

In answer to my inquiries, he replied that he did not intend to move until he got orders, and that he would follow them literally and let the responsibility rest where it belonged. He said that he had made suggestions that were not approved, and if he could not carry out his own plans he could not be held accountable for failure if he literally carried out instructions of which he disapproved.

Regarding the situation as critical, I returned as soon as possible to Washington and made report to General Halleck in person. General Halleck opened his desk and took out a bundle of papers, from which he selected several which he read to me. They were communications which had passed between General Hooker and the President, of which copies were always sent to General Halleck.

From these papers it appeared that Hooker's plan was to capture Richmond while the army of Lee was absent from it, and that the President had replied, in substance, that it would be a poor exchange to give Washington for Richmond; that if, as stated, the enemy was spread out in a long thin line, with one flank resting on Fredericksburg and the other on the Potomac, it would be much better to break through his line and beat him in detail. This was about the substance of these letters, as I remember them.

After reading these papers, General Halleck put on his cap and left the office, no doubt to confer with the President. In half an hour he returned, and quietly remarked, "Hooker will get his orders." This was all he said, but a few days after General Hooker was relieved at his own request, and the command conferred upon General Meade.

General Meade and I had been classmates at West Point, graduating in 1835. I appreciated the difficulties of his position. Called unexpectedly to the command of an army the several corps of which were scattered, and with no plan of operation required to

form his own plans and prosecute a campaign with but little time for consideration, it was certainly a most trying situation.

The following special orders were issued :

HEADQUARTERS OF ARMY,  
ADJUTANT-GENERAL'S OFFICE,  
WASHINGTON, June 27, 1863.

Special Orders, No. 286.

Brigadier-General H. Haupt, United States Volunteers, is hereby authorized and directed to do whatever he may deem expedient to facilitate the transportation of troops and supplies to aid the armies in the field in Virginia, Maryland, and Pennsylvania.

By command of Major-General Halleck.

E. D. TOWNSEND,  
Assistant Adjutant-General.

June 28, 1863, General Meade telegraphed General Halleck, acknowledging the receipt of the order placing him in command of the army, and stated that he was ignorant of the exact condition of the troops and the position of the enemy.

I repaired promptly to Harrisburg, as the best point at which to obtain reliable information as to the situation. I found Colonel Thomas A. Scott at the depot, showed him my orders, and asked for a full report. He informed me that Lee, who had occupied the opposite side of the river in full force, had that morning, June 30, begun to retreat precipitately, in some cases leaving provisions uncooked, and the artillery being on a trot. After hearing a full explanation, with many details unnecessary to repeat, I told Colonel Scott that he was entirely in error as to the cause of Lee's retirement. My explanation of the movement was that Lee had just received information that Hooker had been relieved and Meade placed in command; that Lee knew that our army corps were widely scattered, and that some days would be required before Meade could get them in hand; and that the movement of Lee was clearly not one of retreat but of concentration, with a view to fall upon the several corps and crush them in detail, in which case Washington, Baltimore, and Philadelphia would fall into his possession; and I added emphatically, "We are in the worst position that we have occupied since the commencement of the war, and nothing but the interposition of Providence can save us from destruction."

Colonel Scott replied: "I think you are right. What can be done?"

I immediately, at 10 P. M., sent this telegram :

HARRISBURG, PENN., June 30, 1863.

MAJOR-GENERAL HALLECK, General-in-Chief: Lee is falling back suddenly from the vicinity of Harrisburg and concentrating all his forces. York has been evacuated. Carlisle is being evacuated. The concentration appears to be at or near Chambersburg. The object, apparently, a sudden movement against Meade, of which he should be advised by courier immediately. A courier might reach Frederick by way of Western Maryland Railroad to Westminster. This information comes from T. A. Scott, and I think it reliable.

H. HAUPT,  
Brigadier-General.

Further information continued to be received, and at 12.45 A. M. I sent this second telegram :

HARRISBURG, PENN., July 1, 1863, 12.45 A. M.  
MAJOR-GENERAL H. W. HALLECK, General-in-Chief.  
Information just received, 12.45 A. M., leads to the belief that the concentration of the forces of the enemy will be

at Gettysburg, rather than at Chambersburg. The movement on their part is very rapid and hurried. They returned from Carlisle in the direction of Gettysburg by way of the Petersburg Pike. Firing about Petersburg and Dillsburg this P. M. continued some hours. Meade should by all means be informed and be prepared for a sudden attack from Lee's whole army.

H. HAUPT, *Brigadier-General*.  
(And repeat to General Meade and General Schenck.)

General Meade subsequently informed me that he received these telegrams by courier in his tent at about 3 A. M. on the morning of July 1.

On July 1, I returned to Baltimore via Philadelphia, as the Northern Central had been broken, and organized transportation over the Western Maryland Railroad. J. N. DuBarry, superintendent of the Northern Central Railroad, was relieved at his own request, and Adna Anderson placed in charge, under whose efficient management thirty trains per day were passed over this road under extraordinary difficulties; and, as General Ingalls, Chief Quartermaster, stated, so efficient was the service that at no time were the supplies insufficient for three days' rations in advance.

I then directed my attention to the reconstruction of the Northern Central Railroad, on which nineteen bridges had been destroyed, as also all the bridges on the branches between Hanover Junction and Gettysburg. Before midnight of July 5, all these bridges between Gettysburg and Baltimore had been reconstructed and the telegraph line restored, and on Monday morning, July 6, General Meade was in communication with Washington both by rail and telegraph.

On Sunday morning, the day of Lee's retreat, I rode to Gettysburg in a buggy, and repaired early to General Meade's headquarters, where I found Generals Meade and Pleasonton, and remained with them about three hours. The scene is vividly impressed upon my memory, as also the conversation. We were seated at a small table, upon which was a map of the country,—Meade and Pleasonton on one side, I on the opposite side. General Meade was much surprised to learn that the bridges and telegraph lines had nearly been reconstructed, and that in a few hours he could begin to send his wounded to the hospitals. He remarked that he had supposed that the destruction of the railroads had been so complete that three weeks would be required for their reconstruction. After many incidents connected with the battle had been related, General Pleasonton made the remark that if Longstreet had concentrated his fire more and had kept it up a little longer, we would have lost the day; to which Meade made no reply, and appeared to acquiesce in this opinion.

After other matters had been disposed of, I remarked to General Meade that I supposed he would at once follow up his advantages and capture the remains of Lee's army before he could cross the Potomac. The reply was, "Lee's pontoon-trains have been destroyed, and the river is not fordable. My army requires a few days' rest, and cannot move at present." I was greatly surprised, and said decidedly, "General, I have a construction-corps that could pass that army in less than forty-eight hours, if they had no material except such as could be procured from barns and houses and trees from the woods; and it is not safe to assume that the enemy cannot do what we can." All my arguments and remonstrances proved unavailing, and I left, when the interview ended, fully convinced

that Lee would be permitted to escape, and that the fruits of the glorious victory would be lost.

The situation can be briefly explained. The Federal army had been occupying the Cemetery Ridge for several days. They were not so foot-sore that a march of thirty-five miles would have been impossible; they had ample supplies for at least three days, as the chief quartermaster informed me; they would have moved toward, not from, their proper base of supplies, the Baltimore and Ohio Railroad; they had two good pontoon-trains with which to bridge the river at any desired point. I was quite familiar with the locations, having resided ten years at Gettysburg and made railroad surveys between it and the Potomac, and had walked over the same ground in one day ten miles further than it would have been necessary for the army to march.

The Confederates were depressed by defeat, short of ammunition, especially for artillery, they had a swollen stream not fordable in their front, no pontoon-bridges and no material immediately available for constructing others, no possibility of retracing their route up the Cumberland Valley, as that would have removed them further from their supplies on the south side of the Potomac, and, besides, the Cumberland Valley was occupied by the corps of General Couch, which had not been in action; they were apparently hemmed in a trap.

My opinion has always been that if Meade had moved at once to the Potomac, had occupied a defensible position below Lee's army, thrown bridges across and placed a moderate force with artillery on the south side, within supporting distance from the main army, it would have been impossible for Lee to receive supplies or reinforcements; the batteries, properly placed, would have prevented any attempts to construct bridges; and Lee would have been forced to capitulate. It would not have been necessary to risk an engagement; the enemy would have been checkmated.

I left Meade on Sunday, July 5, about noon, and the next morning, as I find from my records, I was in Washington and had a personal interview with General Halleck, in which the situation was fully explained; and this is the reason why no records were found of any letters or telegrams from me to General Halleck or the President referring to the Meade interview. I find, however, a letter to General Halleck, written from my office in Washington, Monday, July 6, referring to the interview with him in the morning, which throws light upon the subjects discussed at that interview. In this letter I assumed that Lee would escape, and suggested that, as a successful pursuit up the Shenandoah Valley would be hopeless, it was desirable at once to occupy the line of the Orange and Alexandria Railroad with a good cavalry force as far as Lynchburg, destroy telegraph lines and the bridges and tracks on both the roads leading from Richmond, occupy the passes of the Blue Ridge, isolate the army in the Shenandoah Valley, and attack when favorable opportunities offered. These were, of course, mere suggestions for the consideration of the General-in-Chief. The principal value of this letter at the present time is to show that as early as July 6 I had reached the conclusion that Lee would escape, and was occupied with plans of what should be done in that contingency.

The predictions were verified. Lee did escape, but not until July 14, on bridges constructed on the plans

that I had indicated as possible. Meade's army, instead of occupying the line of road east of the Blue Ridge and cutting the communications of the enemy, followed him in a hopeless chase up the Shenandoah Valley, and, when too late to be of efficient service, I was telegraphed to bring all my forces from the line of the Cumberland Valley Railroad and reconstruct with all possible expedition the Orange and Alexandria Railway, which again became the base of supplies.

The records show that even before the interview with General Meade I wrote to General Halleck, expressing apprehension that the pursuit would be so tardy as to lose the fruits of victory. On page 523 of Part III of the Gettysburg records there is a letter to General Halleck, dated Oxford, Pennsylvania, July 4, "11 A. M." This date is an error in the printed records; it should have been P. M., as the letter commences—"Night has overtaken me at Oxford. . . . Persons just in from Gettysburg report the position of affairs. I fear that while Meade rests to refresh his men and collect supplies Lee will be off so far that he cannot intercept him. A good force on the line of the Potomac to prevent Lee from crossing would, I think, insure his destruction."

This letter, it will be perceived, was written from Oxford, seven miles east of Gettysburg, before my interview with General Meade at an early hour the next morning. The fear expressed was so greatly intensified by my personal interview with General Meade that I felt it to be my duty to take an engine and proceed to Washington the same night, to make a personal report to General Halleck, who was my immediate superior.

Although the President seems to have been much exercised over the probability of Lee's escape, the communications between Generals Halleck and Meade, as published in the records, do not indicate disapprobation on the part of the authorities at Washington until the escape had been actually effected, on July 14, when the telegrams were of such character as to induce General Meade to ask to be relieved from the command of the army.

I can readily understand the situation from my relations to General Halleck and familiarity with his policy. Contrary to the generally received opinion, he was unwilling to give any other than very general instructions to the generals in the field. A single illustration will make this clear. At the battle of Fredericksburg I was with Burnside nearly all day in an upper room of the Phillips House overlooking the battle-field. After the battle I took an engine, ran to Aquia Creek, twelve miles, then boarded a steamer and proceeded as rapidly as possible to Washington. I called on President Lincoln and explained the situation. He asked me to walk with him to General Halleck's quarters on I street, near the Arlington. On arrival we found General Halleck at about 11 P. M. in his drawing-room with several officers. These were requested to withdraw, and the President then asked me to repeat my report to General Halleck, which I did. The President then directed General Halleck to telegraph orders to Burnside to withdraw his forces from the south side of the river. General Halleck rose from his seat, paced the room for some time in meditation, and then, standing in front of the President, said emphatically, "*I will do no such thing. If such orders are issued, you must issue them yourself. If we were personally present we might assume such responsibility. I hold that a general*

in command of an army in the field is, or ought to be, better acquainted with all the conditions than parties at a distance, and by giving peremptory orders a serious error might be committed." The President made no reply, but seemed much dejected. I then ventured the remark that I did not consider the situation so serious as he supposed. I explained more in detail the topographical features of the locality and the relative positions of the two armies. Our troops could not be fired upon, nor our bridges enfiladed by the batteries on Marye's Heights, without destroying the city, and I had no doubt that Burnside would retire his army during the night. When I finished, the President, with a deep sigh, remarked, "What you have just told me gives me a great many grains of comfort."

There can be, I think, no doubt that the President from the first shared with me the apprehension that Lee would escape and the war be indefinitely prolonged, but was deterred from interfering with General Meade by the position taken by General Halleck, who would not, unless personally present, assume the responsibility of giving orders.

General M. C. Meigs, Quartermaster-General, had great influence with the President, Secretary of War, and General Halleck, and was often present at their councils. I find among my papers a telegram to General Meigs, dated Frederick, July 8, in which I endeavored to secure his cooperation to induce more prompt action, in which this language is used, "I could build trestle-bridges of round sticks and floor with fence-rails. It is too much to assume that the rebels cannot do the same." I had previously made a similar remark to General Meade.

On July 9, General Halleck telegraphed to General Meade that "the evidence that Lee's army will fight north of the Potomac seems reliable."

This seems to me, under the circumstances, a very remarkable opinion for an officer of so much intelligence as General Halleck; but he may have had reasons for the opinion of which I am not advised. Lee was of necessity short of ammunition. With nearly 300 pieces of artillery in action for three days, it would seem to have been an impossibility for Lee to have retained sufficient ammunition to renew the offensive, and he could get neither ammunition, supplies, nor reinforcements until he could establish communications with the south side of the Potomac. In fact, it was not until July 10 that Lee succeeded in getting some ammunition to Martinsburg, probably carried over the river in rowboats, and this could have been intercepted by a small force on the south side. To me it seems extremely probable, in fact almost certain, that if Lee could have been prevented from getting ammunition to renew an attack, or from constructing bridges on which to cross the river, he would have been forced to capitulate without another battle. If he had attempted to escape by moving up the river, the difficulties of the position would not have been relieved. Meade, having the great advantage of pontoon-bridges, could always safely have maintained a sufficient force on the south side to intercept supplies. Lee's forces were certainly in no condition to renew the contest when they reached the Potomac, and although it might not have been wise to attack them in a strong, defensive position, it is certain that, without supplies, such position could not have been long maintained, and the Federal army could never again hope

for conditions more favorable for themselves. If no decisive move could be made north of the Potomac, it was vain to expect more favorable results on the south side, with the enemy reinforced, supplied, rested, and on their own territory, with communications intact and popular sympathy in their favor.

The records show that the opinions herein expressed are not afterthoughts, but were entertained at the time when the events occurred, and that no efforts were spared on my part to avert the great calamity of the escape of the Confederate army and the prolongation of the contest for two years, with the losses of life and treasure consequent thereon.

Soon after the battle of Gettysburg, for reasons not pertinent to this article, I ceased to be an active participant in the operations of the army; but the construction-corps that I had the privilege of organizing continued, under other officers, to perform most efficient service, and contributed greatly—perhaps it would not be too strong an expression to say was indispensable—to the success of General Sherman in his celebrated march to the sea. The facility with which bridges were reconstructed and broken communications restored enabled him to advance with confidence, leaving hundreds of miles of unprotected railroad communications in his rear.

Colonel Lazelle, formerly in charge of the publication of the records of the war, declared that the services of the Military Railroad Construction Corps had been of the greatest value to the Government, but that they had never been recognized or appreciated.

*Herman Haupt.*

Francis Davis Millet.

"BETWEEN TWO FIRES" is a good example of the work of one of the best-known of American painters. The story is well told, the painting is conscientious and unobtrusive, the figures are well drawn, and the composition is pleasing in color. It shows, perhaps, as well as any of Mr. Millet's pictures, what the qualities are that distinguish his work and have contributed to the painter's excellent position in contemporary art. He seems to have the same desire not to omit detail, and yet not to insist too much upon it, that appears in the work of the great Dutchmen. There is no dash or showy brush-work, though technically Mr. Millet's work is not tame; but the chief characteristic is a certain thoroughness, a straightforward earnestness of intention to be realistic, and the accomplishment of this purpose without making realism the only, or even the predominant, quality. There are charm of expression, healthy sentiment, very clever workmanship, and completeness in all that he does.

In a large picture of "Anthony Van Corlaer, the Trumpeter of New Amsterdam," a fine composition of six or seven figures; in "Rook and Pigeon," an excellent group of two men, with the scene in an English inn in the time of the Stuarts; in "A Waterloo Widow"; in "The Duet"; and in the picture of the traveler at the inn, which belongs to the Union League Club of New York, the painter's admirable qualities are well shown. The picture "Between Two Fires" has been purchased this year from the Royal Academy Exhibition by the Chantrey Fund.

In another line of subjects—those depicting scenes

of Greek and Roman life and single figures of women—Mr. Millet is as successful as in the treatment of English *genre*, and he has also won a reputation as a painter of portraits. Mr. Millet passes the winter season in New York, but lives the rest of the year in London and at his charming home at Broadway in Worcestershire, where he has for neighbors Alma-Tadema, Alfred Parsons, Sargent, and other Englishmen and Americans of note. He was born at Mattapoisett, Massachusetts, and was graduated at Harvard in the class of 1869. He is vice-president of the National Academy of Design, a member of the Society of American Artists, of the American Water Color Society, and of the Royal Institute of Painters of London. He obtained his art schooling at the Antwerp Academy, and received first-class medals at the Antwerp exhibitions in 1873 and 1874. A prize of \$2500 was awarded to him at the American Art Association Exhibition in 1886 for the picture, mentioned above, which is in the Union League Club, and at the Paris Exhibition of 1889 he received a silver medal in the British section. Mr. Millet is widely known as the brilliant war-correspondent of the London "Daily News" in the Russo-Turkish war, and as a clever writer of fiction and descriptive articles. In the field of illustration he has contributed to the magazines a large number of excellent drawings, those of

life and campaigns in the Balkans being particularly noticeable for freshness and vividness in transcription, and marked by great truth of observation and artistic feeling for the picturesque.

*William A. Coffin.*

#### Corrections with Regard to the Washington Family.

MR. THOMAS M. GREEN of Danville, Kentucky, writes to correct two errors in the article on "The Mother and Birthplace of Washington" in THE CENTURY for April, 1892. On page 833 it is stated that Augustine Washington died April 12, 1740, the writer having supplied the last figure, which is obliterated in the entry in the family Bible, with a cipher. Mr. Green quotes from General Washington's letter to Sir Isaac Heard to show that the correct date of Augustine Washington's death was April 12, 1743. Mr. Green also says:

In a note at the bottom of page 832 referring to the godmother of General Washington, who held him in her arms at the baptismal font, the statement is made that "the godmother, Mrs. Mildred Gregory, was an aunt of the infant. She was the daughter of Lawrence Washington, brother of Augustine." The word "brother" in the note was evidently an inadvertence or a misprint. Lawrence Washington was the father of Augustine and of Mildred.

EDITOR.

## IN LIGHTER VEIN.

### Lincoln's Goose Nest Home.

NEAR the graveyard where Lincoln's father and stepmother rest, seven miles south of Charleston, Illinois, in a place then known as Goose Nest, the Lincolns made their final settlement on removing from Indiana. Here Abraham Lincoln assisted his father in "getting settled," as they called it. He helped him build a log cabin, and cleared for him a patch of ground, and when he saw him "under headway" in the new country, bade him good-by and started north afoot. He found employment not far from Springfield, Illinois, where the active part of his early life was spent. Though he did not linger long in the Goose Nest cabin, he was there long enough to stamp his individuality on every heart for miles around, and many are the stories told of his sojourn among these people. It was my lot to be born and reared a few miles from the early home of the Lincolns, and the incidents I shall relate were picked up in conversation with the old settlers about our neighborhood, all of whom knew Lincoln well. I was shown a bridge he helped to build, and many other relics of his boyhood days.

One very old man told me that he once rode up to Thomas Lincoln's cabin and inquired if he could spend the night there. He was informed that the house afforded only two beds, and one of these belonged to a son who was then at home; but if he would get the consent of this boy to take him in as a bedfellow, he could stay. The stranger dismounted, and soon

found the six-foot boy in the back yard lying on a board reading. The boy consented, and the man slept with him that night. The boy was Abraham Lincoln, and the other never tires of telling how he spent the night with the future President.

Tarleton Miles, a veterinary surgeon of Charleston, told me that he had seen Lincoln driving an ox-team into town with cord-wood to sell. One night Lincoln was detained till late selling his wood. It grew dark, and "Abe" thought best not to attempt to drive home. As the Miles homestead was just out of town toward the Lincoln cabin, Lincoln stopped there overnight. His entire outfit, in the way of wearing-apparel, consisted of homespun jeans trousers, knit "galluses," a linsey shirt, and a straw hat. Miles's father sat up till midnight talking with Lincoln, and was amazed at the wisdom he displayed.

I spent four years in Charleston, as salesman in a large dry-goods house there, and as most of the country folks traded at this store, I often enjoyed rare treats in the way of chats with the old settlers about "Abe," as they loved to call him. As I measured off calico for them they measured off "yarns" for me. I said to one old settler, "Did you ever have a hint of Lincoln's greatness while he lived near you?" "No," he said, as he took a chew of "Lincoln green," "I never did. I had six boys, an' any one of 'em seemed as peart to me as Tom's Abe did—'cept perhaps in book-readin'. He always did take to that, an' on that account we uns uset to think he

would n't amount to much. You see, it war n't book-readin' then, it war work, that counted. Now, talkin' about rail-splittin', any of my boys could beat Abe any day he lived, an' any one of 'em could run him a middlin' tight foot-race; an' thess why he should beat 'em in the big race for fame, I can' tell."

"Uncle Johnny" Gordon is an odd character known in Charleston as the "Sassafras Man." In the spring months he may be seen offering for sale neat little bunches of sassafras root, which he has carefully gathered, and which he declares is a "balm for all wounds." For "yarns" of the early days on Goose Nest prairie, and for recollections of Thomas Lincoln, one has only to buy a bunch of sassafras, then make his wants known, and Uncle Johnny will supply them, heaped up and running over. The quality of Gordon's recollections may not be the best, but the quantity can't be questioned.

At the time the Lincolns settled at Goose Nest Dan Needham was the champion wrestler in Cumberland County. This county joins Coles, the one in which the Lincolns lived. Needham had often been told that he would find his match in Tom Lincoln's boy Abe, but he would boast that he could "fling him three best out of four any day he lived." At last they met. It was at a house-raising on the Ambraw River. "Raisin's" at that time brought "neighbors" from many miles around, and I am told that at this one they came from as far south as Crawford County, more than forty miles away. Thomas Lincoln came, and with him his boy Abe. After the work of the day, in which Abe and Dan matched handspikes many times, a "rassle" was suggested. At first Abe was unwilling to measure arms with Dan, who was six feet four and as agile as a panther; but when Thomas Lincoln said, "Abe, rassle 'im," Abe flung off his coat, and the two stood face to face. Four times they wrestled, and each time Needham was thrown.

At the close of the fourth round the combatants again stood face to face, Abe flushed but smiling, Dan trembling with anger. However, one glance at the honest, good-natured face of his opponent cooled his rage, and, extending his rough palm, he said, "Well, I'll be ——!" Ever after this they were warm friends. Needham survived Lincoln many years, and though he was a strong Democrat, he had nothing but good words for Abe. Several of his boys still live near the old homestead in Spring Point township, Cumberland County, Illinois. One daughter, the wife of W. P. Davis,—a brother of the writer,—resides on a farm near Roseland, Nebraska. Uncle Dan, as we called him, now sleeps in a quiet churchyard hidden away in a deep forest. A braver heart never beat; and though his life was humble, I am sure that he did not lack for a welcome into the Eternal City.

Alonzo Hilton Davis.

#### A Counter.

So knavishly they played the game of hearts,  
She counted him a victim to her arts,  
He thought her snared. So, pleased both went their way;  
And yet, forsooth, old strategists were they!

Edith M. Thomas.

#### An Experience.

##### *Tempo Moderato.*

I HAD a dream last night in which I seemed  
To see myself a man immortal deemed.  
My poems, lately placed upon the mart,  
Had gone straight home to every reader's heart,  
And fairly falling o'er each other's feet,  
Demanding copies, mortals thronged the street  
Before the doors of him who had to sell  
The dainty verses that I loved so well.  
Then, as I watched the scramble for my work,  
An angel came and beckoned — with a smirk —  
"Fitz-Alfred Massinger De Greene," she said,  
"Lift up your optics blue and look ahead."  
The which I did — for you must understand  
At all times I obey the soft command  
Of angels, whether winged ones or those  
Who here do lighten or increase our woes.  
And as I looked I saw a wondrous sight  
That dazzled, 't was so marvelously bright,  
As well it might be, for the scroll of fame  
Stood straight before my eyes, and there the name —  
Sensation sweet! Sensation, oh, how blest! —  
Fitz-Alfred M. De Greene led all the rest.

##### *Andante.*

I swooned with very joy, and then I woke  
As yonder church bells sounded forth the stroke  
Announcing morn!

I need not here unfold  
Just how I rose and dressed. The crisp and cold  
Of winter lingered in the atmosphere,  
Yet not for me could anything be drear.  
The while that dream of bliss did haunt my soul,  
Life was all joy unmix'd with tearful dole.

##### *Allegretto.*

But hist! What sound is that I seem to hear?  
The postman's whistle breaks upon my ear.  
A missive from my publisher he brings  
In confirmation of my dream — he flings  
It through the open door.

Be quick to open  
O trusty paper-knife, this envelope.

##### *Allegro.*

Egad, it must be true; a check falls out,  
And here 's a statement of the sales, no doubt.

##### *Crescendo Appassionato Presto.*

Let 's see: one thousand copies printed, two  
Hundred and sixty-seven for review,  
And still on hand when this year was begun —  
Ye Gods! no less than seven thirty-one.  
"Inclosed find twenty cents in royalty —  
Two copies sold!" Scott! *They were bought by me!*

##### *Doloroso.*

Roll on, drear world, nor stop to think of me.  
I go to-day across the salt, salt sea.  
I 'll head for Russia, where, the Czar defied,  
I 'll save myself th' expense of suicide.

John Kendrick Bangs.

MAUD. JANE.

*Afterward* COUSIN WALTER.

MAUD.

THE honeysuckle climbs about  
Outside the window on the trellis,  
The flower-clusters all are out —  
Just sniff and see how sweet their smell is.  
Come, let us go, and in the fields  
We 'll pass the afternoon together ;  
Come, work to pleasure always yields  
On days rejoicing in such weather.

JANE.

No, no ; I found this coat all torn.  
You know, 't is Walter's smoking-jacket,  
And there 's a button —

MAUD.

Oh, forlorn  
Excuse ! — a button ! — let it lack it !  
The rent *was* bad, but after all,  
Dear sister Jane, why should you sew it ?  
You 're not a servant at his call.  
Besides, 't is odds he 'll never know it.  
Come, drop the nasty thing and don  
Your dear old-fashioned muslin bonnet.

JANE.

No ; I must sew this button on.

MAUD.

*At window, seeing* COUSIN WALTER *approaching.*

Then go the while I work upon it.

JANE.

*Handing jacket to* MAUD.

Well, if you will, I 'll run and dress.  
You see the tear 's already mended.

*Exit* JANE *and enter* COUSIN WALTER.

COUSIN WALTER.

*After an admiring glance at* MAUD'S *occupation.*

Dear Maud 's an angel ! I confess  
I wonder why Jane 's more commended.

*William Bard McVickar.*

## An Undiscovered Country.

(IN 1892.)

YOU have no heart ? Ah, when the Genoese  
Before Spain's monarchs his great voyage planned,  
Small faith had they in worlds beyond the seas —  
And *your* Columbus yet may come to land !

*Samuel R. Elliott.*

## Joe Jefferson, our Joe.

JOE JEFFERSON, our Joe Jeff.,  
When first we knew your form,  
You traveled round the country,  
And took the barns by storm.  
But now 't is hearts you hold, Jeff. —  
You took them long ago ;  
God's blessings on your kindly phiz,  
Joe Jefferson, our Joe.

Joe Jefferson, our own Joe,  
We 'ye followed you around ;  
But though a trifle old now  
We yet in front are found.  
And still beyond this stage, Jeff.,  
We 'll follow where you go,  
And greet you when the curtain 's raised,  
Joe Jefferson, our Joe !

*Charles Henry Webb.*

## Never Despair.

UNTO a great big magazine I took one sunny day  
A light and airy symphony, and I was greatly shocked  
To hear the editor in honeyed accents softly say,  
" It is lovely, it is beautiful, but we are overstocked."

Then to another editor I took my symphony :  
He read it with a smile that showed his joy and hap-  
piness.  
" It is just the thing for August, and I like it, but you see  
Our August number 's all made up and ready for the  
press."

" I'll try again," I shouted in my dire extremity,  
As I took it to an editor who read it, all elate,  
While he murmured, " It 's delightful, oh, delightful, but,  
dear me,  
We printed something similar in eighteen sixty-  
eight."

I smiled a very wicked smile, and like the hand of fate  
Came down upon that editor who called my ode divine.  
" How could you, sir, have printed aught like this in  
sixty-eight,  
When your magazine first saw the light in eighteen  
sixty-nine ?"

The editor looked foolish, for he knew that he was  
caught,  
And he chuckled, oh, he chuckled like the greatest  
fiend alive ;  
But like a worthy man he sent me from him rapture-  
fraught,  
With my fingers wound about a purple checklet for  
a five.

*R. K. Munkittrick.*

## To an American Rab.

(FROM HIS FRIENDS.)

NOR Byron's " Boatswain " nor the silken " Flush "  
Of England's laureled poetess ; nor he  
That watched by dying Ailie's bed to see  
The knife's swift issue and to feel the hush  
Of life's still sea — I say thou need'st not blush  
With these to have compared thy pedigree,  
Thy virtues, or thy beauties rare. For we  
Know well thy Gordon line, thy sudden rush  
O'er stubbled field, thy quivering nose low-bent,  
Thy flag-like tail flung wide ; and well we know  
Thy deep-set, solemn eye aglow — attent  
Upon the family or the field. We owe  
Thee praise for love, and faith magnificent,  
And bless thy heart's perpetual overflow.

## WHAT I SAW OF THE PARIS COMMUNE.

### I.

DRAWN BY VIERGE.

THE Franco-German war was over. I had witnessed the great Kaiser's parade on the Longchamps race-course on the 1st of March, 1871, and then had accompanied the German troops who marched down the Champs Elysées into the Placedela Concorde and the wrecked gardens of the Tuileries. A week later I had ridden

behind the old Emperor and the Crown Prince of Saxony as the former reviewed the "Maas Armee," which the latter commanded, drawn up on the plateau between Champigny and Brie, among the grave-mounds beneath which lay the Germans and the Frenchmen who had fallen in the stubborn fighting of Ducrot's great sortie on the east side of Paris. Then my field-work was done, and I had hurried home to London to begin the task I had set myself of writing a book describing what I had seen of the great conflict.

I was toiling ten hours a day at this undertak-

ing when the Commune broke out. Promptly the manager of the "Daily News" dashed to me in a swift hansom, and urged me with all his force to start for Paris that same night. I refused; I was under contract to the publishers, and I burned to see my first book in print. For two months that peremptory manager gave me innumerable bad quarters of an hour, for he was not being served to his liking by the persons whom, in my default, he had commissioned to "do" the Commune for him. At length, on the afternoon of May 19, I finished the last revise of my book, and the same evening—to the great relief of my managerial friend, for a desperate crisis in Paris was clearly imminent—I left London by the Continental Mail.

In those troubled times the train service of the North of France railway was greatly dislocated, and it was nearly midday of the 20th when we halted in the St. Denis station. I foreboded no difficulty, since the halt at St. Denis was normal for ticket-collecting purposes; and I was chatting with a German officer of my acquaintance who commanded the detachment of the Kaiser Alexander Prussian Guard regiment in occupation of the St. Denis station. The collector serenely took up my ticket. There followed him to the carriage door two French gendarmes, who with all the official consequentialness of their species demanded to be informed of my nationality. I enlight-

ened them on that point, and turned to renew the conversation with Von Brockdorff. But the gendarmes were not done with me. They peremptorily ordered me to alight. I requested an explanation, and was told that no foreigners were now allowed to enter Paris, as the fighting force of the Commune was understood to be directed chiefly by foreigners. "But," said I, "I am a newspaper correspondent, not a fighting man." "*N'importe*," replied the senior gendarme; "you look, too, not unlike a military man. Anyhow, you must alight."

"What does this mean, Brockdorff?" I asked, when I had obeyed. "Surely you can do something for me, in charge as you and your fellows are of the station!" "No, my dear fellow," answered the Prussian; "we are here only to maintain order. Two days ago these swallow-tailed gentlemen came from Versailles, and our orders are not to interfere with them." The train went on, leaving me behind; the senior gendarme came up to me, and told me that I should have to return to Calais by the next outgoing train. A thought struck me, and I pleaded hard to be allowed to take instead a local train to Enghien-les-Bains, a few miles away, near the forest of Montmorency, where Brockdorff told me was still residing the Crown Prince of Saxony, to whose staff I had been attached during the siege of Paris. Brockdorff added his persuasions to my solicitations, and finally the gendarme thus far mitigated my sentence.

The Crown Prince of Saxony was at luncheon when I reached the château in which he had his quarters. He roared with laughter when I told him how the gendarme had served me. "These people at Versailles," he explained, "have been leaving the mouth of the trap open all these weeks, and pretty near all the turbulent blackguards of Europe have walked into it. Now they think all the blackguards are inside, and since they are just about to begin business, they have stopped both ingress and egress. Still," he continued musingly, "I am surprised that they did n't let you in!" The Prince has something of a sardonic humor, and he made his point; and I for my part made him my bow in acknowledgment of his compliment. Presently he added: "Mr. Forbes, when you were with us in the winter, we used to think you rather a *rusé* and ingenious man; but I fear now, since you are no longer with us, that you have become dull. Have n't you ever heard the proverb that there are more ways of killing a pig than by cutting its throat? There is a railway to Paris, my friend, and there is also a *chaussée* to Paris. On the railway there are these French gendarmes; on the *chaussée* there is only a picket of your friends of the Kaiser Alexander regiment, who have no orders to stop any one. Now, you join us at luncheon;

then we shall have coffee, and you will smoke one of those long corkscrew cigars which you may remember; and in the evening you will take the 'cocotte train' here in Enghien. If the gendarmes at the St. Denis fetch you out a second time, make them a polite bow, and walk into Paris by the *chaussée*; or, for that matter, you can take the bus from St. Denis."

It was already dusk when I boarded the "cocotte train," and ensconced myself between two young ladies of gay and affable manners, who promised so to cover me with their skirts, when we should reach St. Denis, that the gendarmes would not discover me. The train was full of the frail sisterhood of Paris, who were wont to pay afternoon visits to the German officers of the still envioning army, and were now returning to town. Fairly concealed as the ladies and I thought myself, the lynx-eyed gendarme detected me, and I again had to alight. A commissary of police in the station courteously offered me quarters for the night, but assured me that my entrance into Paris was impossible. I declined his offer, and went into the street, where I found the German soldiers enforcing the old curfew laws. "Everybody must be indoors by nine," said the grizzled sergeant, "else I take them prisoners, and they are kept for the night, and fined five francs in the morning." He did not interfere with me, because I spoke German to him; and I found a hay-loft where I slept. The charge for sitting in a room in St. Denis was ten francs; beds were luxuries impossible to casual strangers.

On the morning of the 21st I left St. Denis by road, and walked straight into Paris without hindrance. The national guards of La Chapelle were turning out for service as I passed through, and there seemed nothing to find fault with in either their appearance or conduct. Certainly there was no unwillingness apparent, but the reverse. Paris I found very somber, but perfectly quiet and orderly. It was the Sabbath morning, but no church-bells filled the air with their music. It was with a far different and more discordant sound that the air throbbled on this bright spring morning—the distant roar of the Versailles batteries on the west and southwest of the enceinte. "That is Issy which gives," quietly remarked to me the old lady in the kiosk at the corner of the Place de l'Opéra, as she sold me a rag dated the 22d and printed the 20th. I asked her how she could distinguish the sound of the Issy cannon from those in the batteries of the Bois de Boulogne. "Remember," she replied, "I have been listening now for many days to that delectable bicker, and have become a connoisseur. The Issy gun-fire comes sharper and clearer, because the fort stands high and nothing intervenes. The reports from the can-

PAINTED BY HUBERT HERKOMER.

ARCHIBALD FORBES.

non in the Bois get broken up for one thing by the tree-trunks, and then the sound has to climb over the enceinte, the railway viaduct, and the hill of Passy." She spoke as calmly as if she had been talking of the weather; and it seemed to me, indeed, that all the few people who were about shared the good lady's nonchalance. Certainly there seemed nowhere any indication of apprehension that the Versaillist hand was to be on the Communist throat before the going down of that Sabbath sun.

I had a horse in Paris, which I had left there since the days of the armistice. It was the same noble steed on which I had ridden in by the gate of St. Ouen, the first "outsider" into Paris after the capitulation, on which occasion the hungry Bellevillites had gazed upon the plump beast with greedy eyes. My first quest was after this animal. I found it, but there was a sentry on the stable. The Commune had requisitioned the horse, and the stable-keeper had resisted the requisition on the ground that it belonged to a foreigner. The matter had been compromised by the posting of a sentry over the animal until the authorities should have maturely weighed the grave question. The sentry declined to depart when I civilly entreated him, nor would he allow me to take out the horse; so I had in the mean time to leave the matter as it stood. From the stable I went to the War Ministry of the Commune, on the south side of the river. The utter absence of red tape and bureaucracy there was a shock to the system of the Briton. I remember being pervaded by the same sensation when years later I went to see General Sherman in the War Department at Washington. Ascending a staircase (not in Washington, but in Paris), I entered a big room full of sergeants and private soldiers bustling to and fro. Unheeded, I passed into an inner room, where I found the man whom I wanted writing among a number of other men in uniform, and a constantly changing throng of comers and goers. "Can I see the chief of staff?" I asked. "Of course you can; come with me." We went into a third room, a fine apartment, with furniture in the style of the First Empire; officers swarmed here, from commandants to lieutenants. Privates came in and had a word, and went away. Amid the bustle there was a certain order and also, seemingly, a certain thoroughness. Without delay I was presented to a gentleman who, I was told, was the *sous-chef* of the staff. I said I desired a pass to witness the military operations in the capacity of a correspondent. With a bow he turned to a staff-lieutenant, and bade him write me the order. The lieutenant set to work at once. He asked me whether I wanted an order for the exterior as well as for the interior operations, and said, "*Bon,*" approvingly when I

told him I wanted an order that would allow me to go anywhere and see everything. The *sous-chef* signed it with the signature "Lefebvre Toncier," told me if ever I wanted any favor or any information to come to him, and made me a civil bow. I think I may reckon that this was the last permit signed by Communist authority.

General Dombrowski was the last of the many generalissimos of the Commune; he had held the command for about a day and a half. His headquarters, I was told, were away out to the west in the Château de la Muette, just behind the enceinte and close to the railway station of Passy. I went to the cab-stand in the Place de la Concorde, and told the first cabman to drive me to the château. "No, monsieur; I have children!" was the reply. I got a *cocher* less timid, who agreed to drive me to the beginning of the Grande Rue de Passy. As we passed the Pont de Jéna the Communist battery on the Trocadéro began to fire. Mont Valérien replied. One, two, three shells from it fell on the grassy slope where I had seen the German soldiers on their entry into Paris lie down and drink their fill of its beauties. One shell felled a lamp-post on the steps close by, and burst on the flags. My cabman struck, and very nearly carried me back with him in his hurry to be out of what he evidently considered an unpleasant neighborhood. There was nothing for me but to alight, and to go on foot up the Grande Rue. Here there was hardly any resident population, but a large colony of shell-holes. National guards, sailors, and franc-tireurs had quartered themselves in the houses, and lounged idly about the pavements. There were no symptoms of fear anywhere, and the shells were coming into the vicinity pretty freely. At the further end of the street I turned to the right through a large gateway into a short avenue of fine trees, at the end of which I entered the Château de la Muette. Dombrowski gave me a most hearty and cordial greeting, and at once offered me permission to attach myself to his staff permanently, if I could accept the position as it disclosed itself. "We are in a deplorably comic situation here," said he, with a smile and a shrug, "for the fire is both hot and continuous."

Dombrowski was a neat, dapper little fellow of some five feet four inches, dressed in a plain, dark uniform with very little gold lace. His face was shrewd—acuteness itself; he looked as keen as a file, and there was a fine, frank, honest manner with him, and a genial heartiness in the grip of his hand. He was the sort of man you take to instinctively, and yet there were ugly stories about him. He wore a slight mustache and rather a long chin-tuft, which he was given to pulling as he talked. He

spoke no English, but talked German fluently. His staff consisted of eight or ten officers, chiefly plain young fellows who seemed thoroughly up to their work, and with whom, not to be too pointed, soap and water seemed not so plentiful as was their consummate coolness. Dombrowski ate, read, and talked all at once, while one could hardly hear his voice for the din of the cannonade and the whistle of the shells. He showed great anxiety to know whether I could tell him anything as to the likelihood of German intervention, and it struck me that he would be very glad to see such a solution of the strange problem. We had got to the salad when a battalion commandant, powder-grimed and flushed, rushed into the room and exclaimed in great agitation that the Versaillist troops were streaming inside the enceinte at the gate of Billancourt, which his command had been holding. The cannonade from Issy had been so fierce that his men had been all under shelter, and when the Versaillists came suddenly on, and they had to expose themselves and deliver musketry-fire, the shells fell so thick and deadly that they bolted, and then the Versaillists had carried the gate, and now held it. His men had gone back in a panic. He had beaten them — *sacré nom*, etc. — with the flat of his sword till his arm ached, but he had not

gate of Billancourt. Dombrowski waited until the gasping officer had exhausted himself, then handed him a glass of wine with a smile, and with a serene nod turned to his salad, and went on eating it composedly and reflectively. At length he raised his head:

“Send to the Ministry of Marine for a battery of seven-pounders; call out the cavalry, the *tirailleurs* [of some place or other, I did not catch where], and send such and such battalions of national guards. Let them be ready by seven o’clock. I shall attack with them, and lead the attack myself.”

The Ministry of Marine, I may remark, had been turned into an arsenal. It was a sign of the times that the officer to whom Dombrowski dictated this order, like himself a Pole, did not know where to find the Ministry of Marine. Directions having been given him as to its locality, the lieutenant suggested that he might not be able to get a whole battery.

“Bring what you can, then,” said Dombrowski; “two, three, or four guns, as many as you can, and see that the tumbrils are in order. Go and obey!”

“Go and obey” was the formula of this peremptory, dictatorial, and yet genial little man. He had a splendid commanding voice, and one might have judged him accustomed to dictat-

ASSASSINATION OF GENERALS CLEMENT THOMAS AND JULES LECOMTE, AT MONTMARTRE, MARCH 18, 1871.

succeeded in arresting the panic, and his battalion had now definitely forsaken the enceinte. The Versaillists were massing in large numbers to strengthen the force that had carried the

ing, for he would break off to converse and take up the thread again, as if he had been the chief clerk of a department.

While Dombrowski was eating his prunes

A BURSTING BOMB.

ENGRAVED BY CHARLES STATE.

after his salad,—like most Poles, he seemed a miscellaneous feeder,—there came bustling in a fussy commandant with a grievance. His grievance was thus expressed: “General, I have been complained against because I have too large a staff, and have been ordered to bring the return to you.” Dombrowski took the return, and read it. “A commandant,” he exclaimed, “and with a staff of ten officers! What!” Here he rose and swept his arm round the table with a gesture of indignation. “Look, citizen commandant! Here am I, the general, and behold my staff, nine hard-working men; and you, a commandant, have ten loafers! I allow you one secretary; go and obey!” And the discomfited commandant cleared out.

The shell-fire was increasing. Dombrowski told me that the Château de la Muette belonged to a friend of Thiers, and that therefore, although it was known to be his headquarters, there were orders that it should be somewhat spared. All I have to say is, that if

there were any efforts made to spare it, the Versaillist gunners were very bad shots. One shell went through the wall bounding the avenue; another struck the corner of the house so hard that I thought it was through the wall. Dombrowski's nerves were strong, and he had trained his staff to perfection. When this shell burst he was speaking to me. I started. I don't think his voice vibrated a single chord. The officers sitting round the table noticed the explosion no more than if it had been a snapping-bonbon at a ball supper. A soldier waiter was filling my cup with coffee. The spout of the coffee-pot was on the cup. There was no jar; the man's nerves were like iron. There was good, quiet, firm, undemonstrative stuff here, whatever there might be elsewhere. Dombrowski's adjutant took me up-stairs to the roof, where there was an observatory. The staircase and upper rooms had been very freely knocked about by shell-fire, notwithstanding the friendship of M. Thiers for the owner of the château. The observatory, which was of

wood planking, was riddled with chassepot bullets; and when I showed myself incautiously on the leads, I drew fire with an alacrity so surprising that I was not in the slightest degree ashamed to make a precipitate retreat.

The park of the Château de la Muette slopes down to the enceinte in front of Passy. One could not see the enceinte for the foliage. Beyond the enceinte was a belt of clearing, then came the dense greenery of the Bois de Boulogne, and behind this green fringe was the bed of the great lake. From this fringe of wood great isolated puffs of smoke were darting out. Those were from single cannon. I saw no concentrated battery. But there clearly were at intervals single cannon in small emplacements at a distance from the enceinte of from 400 to 500 paces. From the edge of the fringe also, behind little trenches at the throats of the drives, smaller puffs spurted from the chassepots of Versaillist marksmen trying to pick off the Federals on the enceinte and on the advanced horn-works in front of the gates of Passy and Auteuil. Just above the gate of Passy the Federals had a battery on the enceinte, which was firing steadily and with good effect. The gate of Passy was not much injured, but might have been stormed by a resolute forlorn hope, were it not for the earthen outwork thrown up during the Prussian siege. The gate of Auteuil and the enceinte for some distance on each side were utterly ruined. This Dombrowski did not attempt to deny. But he pointed out that the advanced earthwork was held, and strongly held — not an obstacle, perhaps, it seemed to me, to thwart men bent on gaining an object or losing their lives, but quite sufficient to all appearance to keep the cautious Versaillists from exposing themselves in the open on the way to it. Further south, by the gate of Billancourt and round to the Seine, the enceinte was no great thing to boast of. Certainly no man needed wings to get inside thereabouts. In proof of this, since I joined him, Dombrowski, as I have related, had received tidings that the Versaillists had carried that gate.

There was a good deal more risk than amusement in remaining in the observatory, and I descended to the ground floor. Dombrowski was standing, sword in hand, dictating three orders at once. He stopped to ask me what I thought of the prospect I had looked down on from the roof. I could not conscientiously express the opinion that it was reassuring from the Federal point of view. "I am just dictating an order," said Dombrowski, "which will inform Paris that I abandon the enceinte from the Porte d'Auteuil to the river. If you are a military man, you must recognize the fact that our loss of Fort Issy has made virtually un-

tenable that section of the continuous fortification of which I speak. Its province was to coöperate with, not to resist, Fort Issy. For several days past I have foreseen the necessity of which I am now informing Paris, and I have prepared a second line of defense, of which the railway viaduct defines the contour, and which I have made as strong as the enceinte and more easily tenable. Yes; the Versaillists are in possession of that gate you heard the flurried commandant talk of. They may have it and welcome; the possession of it will not help them very much. But, all the same, I don't mean to let them keep their hold of it without giving them some trouble, and so I am going to make an attack on them to-night. As like as not they will fall back from their occupancy of to-day, and then they will have the work to do over again to-morrow. But I am not going to fight with serious intent to retrieve this condemned section of enceinte, as the order I have been dictating for publication will show; but merely, as I may say, for fighting's sake. There is plenty of fight still in our fellows, especially when I am leading them."

I could not for the life of me make up my mind, nor have I done so to this day, whether Dombrowski's cheerful words were *blague*, or whether the little man was really in dead earnest. With a promise from him that he would not start on his enterprise without me, I went into a side room to write a few lines for my newspaper. I had finished, and was instructing the soldier messenger, whom Dombrowski's adjutant was good enough to place at my disposal, where to deliver the packet containing my message, when an urgent summons came to me to join the general. The little man was on top of a very lofty charger, which was dan-

A SECRET SESSION OF THE COMMUNE.

cing about the lawn on its hind legs. For me, alas! there was no mount, big or little; my horse was in the stable behind the Rue Faubourg St. Honoré, with that relentless sentry standing over it. Messenger after messenger had come hurrying in from the Point du Jour quarter entreating for immediate succor, as the

holders of the positions thereabouts were being hard pushed. The cannonade and fusillade from the Seine all the way to the Neuilly gate, and probably beyond, continued to increase in warmth as we hastened down the Rue Mozart. The Versaillist batteries were in full roar; and it was not possible, had some guns still remained undismounted on the enceinte, to respond effectively to their steady and continuous fire of weighty metal. Some reinforcements were waiting for Dombrowski on the Quai d'Auteuil, partly sheltered by the houses of the landward side of the quay from the fire which was lacerating the whole vicinity. The tidings which greeted the little general were unpleasant when he rode into the Institution de Ste. Péline, which was occupied as a kind of local headquarters. It was the commandant of the 93d National Guard battalion who had come to the Château de la Muette to tell Dombrowski how his men had been driven from the gate of Billancourt in the afternoon. From what I could hurriedly gather, there had subsequently been a kind of rally. National guards had lined the battered parapet of the enceinte between the gates of Billancourt and Point du Jour and further northward to and beyond the gate of St. Cloud. For some time they had clung to the positions with considerable tenacity under a terrible fire, but had been forced back with serious loss, mainly by the close and steady shooting of the Versaillist artillery of the breaching-batteries about Boulogne and those in the more distant Brimborion. The gate of St. Cloud, as well as that of Point du Jour, had followed the Billancourt gate into the hands of Versaillists, who, having occupied the enceinte in force and the adjacent houses inside, had pushed strong detachments forward to make reconnaissances up the rues Les Marois and Billancourt, one of which bodies at least had penetrated as far as the railway viaduct, but had been driven back.

Dombrowski smiled as this news was communicated to him, and I thought of his "second line of defense," and of his assurance that "the situation was not compromised." By this time it was nearly nine o'clock, and it seemed to me that the Versaillists must have got cannon upon or inside the enceinte, the fire came so straight, so hot, and so heavy into and about the Institution de Ste. Péline. Dombrowski and his staff were very active and daring, and the heart of the men seemed good. There was some cheering at the order to advance, and the troops, consisting chiefly of *franc-tireurs* and men wearing a zouave dress, so far as I could see in the gloom, moved out from behind the viaduct into the Rue de la Municipalité (that was its name then, but I think it is now called the Rue Michel). A couple of guns—only field-

guns, I believe—opened fire on the Ceinture railway to the left of the Rue de la Municipalité, and under their cover the infantrymen debouched with a short-lived rush. Almost immediately, however, utter disorganization ensued, the result of a hot and close rifle-fire which seemingly came chiefly from over a wall which I was told inclosed the Cimetière des Pauvres. The Federals broke right and left. One forlorn hope I saw spring forward and go at the corner of the cemetery wall in the angle formed by a little cross-street, under the passionate leadership of a young staff-officer whom I had noticed in the Château de la Muette at dinner-time. There was a few moments' brisk cross-fire, then the Federal spurt died away, and the fugitives came running back, but without their gallant leader. Some affirmed that Dombrowski himself took part in this rash, futile effort, but the locality was too warm for me to be able to speak definitely on this point. Meanwhile there seemed to be almost hand-to-hand fighting going on all along the exterior of the viaduct. I could hear the incessant whistle and patter of the bullets, and the yells and curses of the Federals, not a few of whom owed the courage they displayed to alcoholic influences. Every now and then there was a shout and a short rush, then a volley which arrested the rush, and then a stampede back under cover. Soon after ten it was obvious that the fight was nearly out of the Communists. Dombrowski I had long since lost sight of. One officer told me that he had been killed close to the churchyard wall; another, that his horse had been shot under him, and that he had last seen the daring little fellow fighting with his sword against a Versaillist marine, who was lunging at him with his bayonet. After the Commune was stamped out, accusations of treachery to the cause he was professing to serve were made against Dombrowski. All I can say is, that so far as I saw him, he bore himself as a true man and a gallant soldier; and seeing that he lost his life in the struggle, it seems the reverse of likely that he had sold himself to the Versaillists.

Then came a sudden panic, and I was glad to make good my retreat behind the "second line of defense," which was not easily recognizable as a line of defense at all, and concerning which I suspected that Dombrowski must have been gasconading. Once behind the railway, the Federal troops held their ground for some time with a show of stiffness. Occasional outbursts of fire indicated the attacks made by detached parties of Versaillists; but those flashes of strife gradually died away, and about eleven o'clock the quietness had become so marked that I thought the work was over for the night, and that Dombrowski's anticipations had been at least partly realized. The pause

THE RUE DE RIVOLI UNDER THE COMMUNE.

ENGRAVED BY C. SCHWARZBURGER.

was deceptive. The Versaillists must have been simply holding their hands for a time to make the blow heavier when it should fall. No doubt they had their combinations to mature elsewhere. No doubt they were pouring in force into the area between the enceinte and the Ceinture railway. They were quiet for a purpose while they were doing this—lining the enceinte and packing the thoroughfares with artillery. We could hear in our rear in the distance the *générale* being beaten in the streets of Paris. A staff-officer, who spoke English like a native, came to me and told me how he mistrusted the pause, and feared that the supreme hour had come at last. It was near midnight when a strong fire of cannon and musketry opened on the viaduct. At the same moment there came on the wind the noise of heavy firing from the north. I heard some one shout: "We are surrounded! The Versaillists are pouring in by the gates of Auteuil, Passy, and La Muette!" This was enough. A mad panic set in. The cry rose of "*Sauve qui peut!*" mingled with the other shouts of "*Nous sommes trahis!*" Arms were thrown down, accoutrements were stripped off, and every one bolted at the top of his speed, many officers leading the *débâcle*. I came on one party—a little detachment of franc-tireurs—standing fast behind the projection of a house, and, calling out that all the chiefs had run away, left

them. Whether this was the case as regards the higher commands, I could not tell. I do not believe Dombrowski was the man to run, nor any of his staff. But certainly none of them were to be seen. There was a cry, too, that there was an inroad from the south; and so men surged, and struggled, and blasphemed confusedly up the quay in wild confusion, shot and shell chasing them as they went. In the extremity of panic mingled with rage, men blazed off their pieces indiscriminately, and struck at one another with the clubbed butts. Then battalions or detachments were met coming up, upon which surged the tide of fugitives, imparting to them their panic, and carrying them away in the rush.

There was an interval of distracted turmoil during which, in the darkness and in my comparative ignorance of that part of Paris, I had no idea for a time whither I was being carried in the throng of fugitives. The road was wide, and I was able to discern that it was bounded on the right by the Seine; by after reference to the map, I found that the thoroughfare we had been traversing was the Quai de Passy. After a while I struck out of the turmoil up a silent street on the left, and for a time wandered about in utter ignorance of my whereabouts. I can hardly tell how it came about that in the first flicker of the dawn I found myself on the Place du Roi de Rome (now, I be-

lieve, called the Place du Trocadéro). There was a dense fog, which circumscribed my sphere of vision, and I knew only that I was standing on sward in an utter solitude. A few steps brought me into the rear of a battery facing westward, from which all the guns had been carried off except one which had been dismantled, evidently by a hostile shell, and lay among the shattered fragments of its carriage. Close by, no doubt killed by the explosion of the same shell which had wrecked the gun, were two or three dead Communists. As it became lighter, and the fog was slowly dispersing, the slopes of the Trocadéro disclosed themselves on my left, and I realized that I must be standing in the Trocadéro battery of which I had heard Dombrowski speak on the previous afternoon. Looking westward along the Avenue de l'Empereur (now the Avenue Henri Martin), I saw a battery of artillery advancing up it at a walk, with detachments of sailors abreast of it on each sidewalk. I had not to ask myself whether these

troops, advancing with a deliberation so equable, could belong to the beaten and panic-stricken army of the Commune. No; that could not be. They were, for sure, Versaillist troops coming to take possession of the Trocadéro. Indeed, had there been no other evidence, their method of announcing themselves by half a dozen chassepot bullets fired at the lone man standing by the battery was conclusive. I took the hint to quit, and started off abruptly in the direction of the Champs Elysées. I came out on the beautiful avenue by the Rue des Chaillots, about midway between the Arc de Triomphe and the Rond Point; and lo! round the noble pile which commemorates French valor stood in close order several battalions of soldiers in red breeches. Thus far then, at all events, had penetrated the Versaillist invasion of Paris in the young hours of the 22d. The French regulars were packed in the Place de l'Étoile as densely as were the Bavarians on the day of the German entry three months before. No cannon-fire was directed on them from the great Federal barricade at the Place

DRAWN BY A. F. JACCACI.

AT THE CORNER OF THE RUE ROYALE AND FAUBOURG ST. HONORÉ.\*

de la Concorde end of the Tuileries gardens, but national guards were showing about it, and now and then sending a rifle-bullet ineffectively at the dense masses of the Versailles. The latter, for their part, seemed to take things very deliberately, and to be making quite sure of their ground before advancing

and then, tracking them by side streets, I found they pressed on steadily, firing now and then, but not heavily, till they reached the open space at the head of the Boulevard Haussmann, in front of the Pépinière Barracks. This was a singularly commanding position, and thus early one could fathom the tactics of the

further. They had a field-battery in action a little way below the Arc, which swept the Champs Elysées very thoroughly. I saw several shells explode about the Place de la Concorde, and was very glad when I had run the gantlet safely and reached the further side of the great avenue. I was making toward the Parc Monceaux, when a person I met told me that Versailles troops, marching from the Arc along the Avenue de la Reine Hortense (now the Avenue Hoche), had come upon the Communists throwing up a barricade, and had saved them the trouble of completing it by taking it from them at the point of the bayonet. Here I very nearly got shut in, for as we talked there was a shout, and, looking eastward, I saw that a strong force of Versailles, with artillery at their head, were marching along the Avenue Friedland toward the Boulevard Haussmann. I was just in time to dodge across their front,

Versaillists. Occupying in strong force, and with numerous artillery, certain central points, from each of which radiated several straight thoroughfares in different directions, their design was to cut Paris up into sections, isolating the sections one from another by sweeping with fire the bounding streets. From this position, at the Pépinière, for instance, they had complete command of the Boulevard Haussmann down to its foot at the Rue Taitbout, and of the Boulevard Malesherbes down to the Madeleine, thus securing access to the great boulevards and to the Rue Royale, by descending which could be taken in reverse the Communist barricade at its foot, facing the Place de la Concorde. Desirous of seeing anything that might be passing in other parts of the city, I made my way by devious paths in the direction of the Palais-Royal. Shells seemed to be bursting all over Paris. They

were time-fuse shells; and I could see many of them explode in white puffs high in air. Several fell on and about the Bourse as I was passing it, and the boulevards and their vicinity were silent and deserted save for small detachments of national guards hurrying backward and forward. It was difficult to tell whether the Communists meant to stand or fall back, but certainly everywhere barricades were being hastily thrown up. All these I evaded until I reached the Place du Palais-Royal. Here two barricades were being constructed, one across the throat of the Rue St. Honoré, the other across the Rue de Rivoli between the Louvre and the hotel of the same name. For the latter material was chiefly furnished by a great number of mattresses of Sommier-Tucker manufacture, which were being hurriedly pitched out of the windows of the warehouse, and by mattresses from the barracks of the Place du Carrousel. The Rue St. Honoré barricade was formed of furniture, omnibuses, and cabs, and in the construction of it I was compelled to assist. I had been placidly standing in front of the Palais-Royal when a soldier approached me, and ordered me to lend a hand. I declined, and turned to walk away, whereupon he brought his bayonet down to the charge in close proximity to my person. That was an argument which, in the circumstances, I could not resist, and I accompanied him to where a red-sashed member of the Committee of the Commune was strutting to and fro superintending the operations. To him I addressed strong remonstrances, explaining that I was a neutral, and exhibiting to him the pass I had received from the War Department the day before. He bluntly refused to recognize the pass, and offered me the alternative of being shot or going to work. I was fain to accept the latter. Even if you are forced to do a thing, it is pleasant to try to do it in a satisfactory manner; and observing that an embrasure had been neglected in the construction of the barricade, notwithstanding that there was a gun in its rear, I devoted my energies to remedying this defect. The committeeman was good enough to express such approbation of this amendment that when the embrasure was completed he allowed me to go away. Looking up the Rue Rivoli, I noticed that the Communists had erected a great battery across its junction with the Place de la Concorde, armed with cannon which were in action, firing apparently up the Champs Elysées. Leaving the vicinity of the Palais-Royal, I went in the direction of the new opera-house. Reaching the boulevard, I discovered that the Versailles must have gained the Madeleine, between which and their position at the Pépinière Barracks no obstacle intervened; for they had thrown

up across the Boulevard de la Madeleine a barricade of trees and casks. The Communists, on their side, had a barricade composed chiefly of provision-wagons across the boulevard at the head of the Rue de la Paix. For the moment no firing was going on, and as it was getting toward noon I determined to try to reach my hotel in the Cité d'Antin and to obtain some breakfast.

Leaving the boulevard by the Rue Taitbout, I found my progress hampered by a crowd of people as I approached the bottom of the Boulevard Haussmann. By a strenuous pushing and shoving I got to the front of this throng, to witness a curious spectacle. There was a crowd behind me. Opposite to me, on the further side of the Boulevard Haussmann, another crowd faced me. Between the two crowds was the broad boulevard, actually alive with the rifle-bullets sped by the Versailles from their position about 1000 yards higher up. On the iron shutters of the shops closing it at the bottom—shops in the Rue Taitbout—the bullets were pattering like hailstones, some dropping back flattened, others penetrating. This obstacle of rifle-fire it was which had massed the crowds on each side. Nor were the wayfarers thus given pause without reason, for in the space dividing the one crowd from the other lay not a few dead and wounded who had dared and suffered. My hunger overcame my prudence, and I ran across without damage except to a coat-tail, through which a bullet had passed, making a hole in my tobacco-pouch. A lad who followed me was not so fortunate; he got across indeed, but with a bullet-wound in the thigh.

Having ordered breakfast at my hotel in the Cité d'Antin, a recessed space close to the foot of the Rue de Lafayette, I ran to the junction of that street with the Boulevard Haussmann just in time to witness a fierce fight for the barricade across the latter about the intersection of the Rue Tronchet. The Communists stood their ground resolutely, although falling fast under the overwhelming fire, until a battalion of Versailles made a rush and carried the barricade. It was with all the old French *élan* that they leaped on and over the obstacle and lunged with their sword-bayonets at the few defenders who would not give ground. Those who had not waited for the end fell back toward me, dodging behind lamp-posts and in doorways, and firing wildly as they retreated. They were pursued by a brisk fusillade from the captured barricade, which was fatal to a large proportion of them. Two lads standing near me were shot down. A bullet struck the lamp-post which constituted my shelter, and fell flattened on the asphalt. A woman ran out

CANNON OF MONTMARTRE ON THE EVE OF MARCH 18, 1871.

FROM A PHOTOGRAPH BY LECADRE.

from the corner of the Rue Chaussée d'Antin, picked up the bullet, and walked coolly back, clapping her hands with glee!

After eating and writing for a couple of hours, I determined to go to the North of France railway terminus, and attempt to get a letter to my paper sent out. One saw strange things on the way. What, for instance, was this curious fetish-like ceremony going on in the Rue Lafayette at the corner of the Rue Lafitte? There was a wagon, a mounted Spahi as black as night, and an officer with his sword drawn. A crowd stood around, and the center of the strange scene was a blazing fire of papers. Were they burning the ledgers of the adjacent bank, or the title-deeds of the surrounding property? No. The papers of a Communist battalion it was which were being thus formally destroyed, no doubt that they should not bear witness against its members. The episode was a significant indication of the beginning of the end; nor were other tokens wanting, for English passports were being anxiously sought. At the terminus the unpleasant report was current that the Prussians had shunted at St. Denis all the trains leaving Paris, and were preventing everybody from passing their lines. There was one chance. I suborned a railway employee of acute aspect to get out of Paris by walking through the railway tunnel, and should he reach St. Denis, to give my letter to a person there whom I could trust to forward it. My emissary put the missive cheerfully in

his boot and departed, having promised to come to my hotel at 8 P. M., and to report his success or failure. I never saw him or heard of him any more.

On my way back from the Gare du Nord, I met with an experience which was near being tragical. Hearing firing in the direction of the Church of Notre Dame de Lorette, I left the Rue Lafayette for the Rue Chateaudun. When I reached the Place, in the center of which the church stands, I found myself inside an extraordinary triangle of barricades. There was a barricade across the end of the Rue St. Lazare, another across the end of the Rue Lorette, and a third between the church and in front of the Place, looking into the Rue Chateaudun. The peculiarity of the arrangement consisted in this, that each of these barricades could be either enflamed or taken in reverse by fire directed against the others, so that the defenders were exposing themselves to fire from flank and rear, as well as from front. I took a protected position in the church porch, to watch the outcome of this curious state of things. But the officer in command happened to notice me, approached, and ordered me to pick up the musket of a man who had just been bowled over, and to take a hand in the defense of the position. I refused, urging that I was a foreigner and a neutral. He would by no means accept the excuse, and gave me the choice of the cheerful alternative of complying or being forthwith shot. I did not believe

him serious, and laughed at him; whereupon he called to four of his men to come and stick me up against the church wall, and then constitute themselves a firing-party. They had duly posted me, and were proceeding to carry out the program, when suddenly a rush of Versaillists came upon and over the Rue St. Lazare barricade, whereupon the defenders precipitately evacuated the triangle, the firing-party accompanying their comrades. I remained, not caring for the society I should accompany if I fled; but I presently came to regard my fastidiousness as folly. For several shots from Versaillist rifles came too near to be pleasant, and in a twinkling I was in Versaillist grips, and instantly charged with being a Communard. The people in the red breeches set about sticking me up against the church wall again, when fortunately I saw a superior officer, and appealed to him. I was bidden to hold up my hands. They were not particularly clean, but there were no gunpowder stains on the thumb and forefinger. Those stains were, it seemed, the brand marking the militant Communard, and my freedom from them just pulled me through. It was a "close call," but then a miss is as good as a mile.

Late in the afternoon the drift of the retreating Communists seemed to be in the direction of Montmartre, whence their guns were firing over the city at the Versaillist artillery, now on the Trocadéro. The Versaillists, for their

part, were also moving deliberately in the Montmartre direction, and before dusk had reached the Place de l'Europe at the back of the St. Lazare terminus. From this point on the north they held with their advanced forces a definite line down the Rue Tronchet to the Madeleine. They were maintaining their fire along the Boulevard Haussmann, and from their battery at the Madeleine they had shattered the Communist barricade on the Boulevard des Capucines at the head of the Rue de la Paix. The Communists were undoubtedly partly demoralized, yet they were working hard everywhere at the construction of barricades.

About 8 P. M. the firing died out everywhere, and for an interval there was a dead calm. What strange people were those Parisians! It was a lovely evening, and the scene in the narrow streets off the Rue Lafayette reminded me of the aspect of the down-town residential streets of New York on a summer Sunday evening. Men and women were placidly sitting by their street doors, gossiping easily about the events and the rumors of the day. The children played around the barricades; their mothers scarcely looked up at the far-off sound of the *générale*, or when the distant report of the bursting of a shell came on the soft night wind. Yet on that light wind was borne the smell of blood, and corpses were littering the pavements not three hundred yards away.

Archibald Forbes.

## THE WHIST-PLAYERS.

HEY play whist, the beaus in their powdered wigs and velvet coats, the ladies in their brocade petticoats and fine stomachers. The west windows are open; a fountain plashes in the garden; the flower-beds are bordered with box, and the scent of the box comes in at the open windows.

They play whist. A beau shakes back the lace frill from his hand as he deals. A red jewel gleams on his finger. The ladies' brocades rustle; they frown softly at their cards. An hour-glass stands on a table inlaid with mother-

of-pearl; the sand in the hour-glass flows silently; the pungent smell of the box comes in at the open windows.

They play whist. A lady leads from her long suit; a beau takes the trick with a king. His black eyes flash under his white wig like eternal youth.

The fountain plashes in the garden; the pungent smell of the box comes in at the open windows; the sand in the hour-glass flows as silently as the lives of the players.

They play whist. A beau leads an ace; his partner trumps. A trick is lost, but he looks at her, and smiles. A trick is lost — but love is immortal.

Mary E. Wilkins.

## THE LOTTO PORTRAIT OF COLUMBUS.

HERE is no excuse for bringing forward a new portrait of Columbus at this late day unless it has more than the mere smack of possibility about it. For there are already something like six times six Columbuses in the field, and every one brings in a separate tale, and every tale condemns Columbus for — some other person. The confusion of testimony is, however, no good reason for wholly rejecting all the portraits, with the assumption that the discoverer never was drawn, carved, or painted from life. Positive and direct proof for any likeness of him cannot be adduced. The evidence, if it ever existed, has been lost in the lapse of years. But there are probabilities that seem to attach themselves to two recurrent types, and these form chains of circumstantial evidence worthy of consideration. The original of one of these types, perhaps the earliest of all the portraits, we have before us in the recently discovered picture by Lorenzo Lotto, engraved for the frontispiece of this magazine.

The history of this portrait is brief, and about as unsatisfactory as any of the other Columbuses. It is supposed to have been painted for Domenico Malipiero, the Venetian senator and historian, at the instance of his correspondent, Angelo Trevisan (Trivigiano), secretary of the Venetian ambassador to Spain, who in 1501 was in intimate communication with Christopher Columbus at Granada. Malipiero's manuscripts (and presumably this picture) are said to have passed to Senator Francesco Longo. The Gradenigos were the heirs of the Longos, and it was from them that the Cavaliere Luigi Rossi, a steward of the Duchess of Parma, purchased the picture. Just before Rossi's death the picture was sold to a person named Gandolfi, who had it somewhat repaired and restored. The badly damaged head and red cap of an Indian at the right were cut out, and the picture was made square instead of oblong. From Gandolfi it passed to Signor Antonio della Rovere of Venice, in whose house it was seen in 1891 by Captain Frank H. Mason, United States Consul-General at Frankfort-on-the-Main, and by him bought for the World's Fair at Chicago. The record cannot be traced with any certainty beyond the Gradenigos, and even if it could, it would prove no more than what the picture itself reveals. The best evidence for or against any picture is internal, not external.

It is hardly worth while arguing the antiquity of the canvas. It speaks for itself, and says unmistakably that it is old Italian — Venetian-Italian at that. The archaeological methods of determining the place of a work of art are now too well known for explanation, and too accurately based to admit of much error. Neither is it worth while to go afield in search of a painter for the portrait, when the name of the very man we would naturally attribute it to is upon the canvas. The signature and date read "Lauren<sup>s</sup> Lotto f, 1512." Both are genuine, though the date had been clumsily scumbled over with gray paint. It has been suggested that the signature was not the one Lotto usually signed. He had no usual signature until 1522, and even after that it varies. I have before me as I write eight facsimiles of his signature, all written differently, and yet all, in common with this signature, possessed of a certain character that shows them to have come from one hand. Had the signature on this portrait been a falsification, we may be sure it would not have varied a hair's-breadth from those on the well-known portraits in the Brera, or that upon the St. Antoninus in SS. Giovanni e Paolo in Venice. The variation is a proof of genuineness. But the signature is corroboration only, not proof positive.

Lorenzo Lotto was a painter who in his portraits was hardly second to Titian, and yet there remain to us few facts in his life. He was born probably about 1480, and as a painter was Venetian with some provincial earmarks about him. Of the school of Giovanni Bellini, he was a friend and fellow-worker with Palma, and after 1512 shows the influence of Giorgione and, later, of Titian. With a faculty for grasping technical features in others, Lotto brought many reminiscences of his contemporaries into his works. It has been said that he was influenced by Correggio (a mistake), by Leonardo (another mistake), by Pennacchi, Carpaccio, Cima, and half a dozen other painters. That he was a borrower there can be no doubt, and this portrait shows his characteristic borrowings. The sharp articulated drawing in both hands and face points to his master Giovanni Bellini; the angularities of drapery, especially in the right sleeve, suggest Bartolommeo Vivarini; the fullness of the cloak and figure are Palmesque; the coloring, especially in the scarlet under-coat with the white edging at the neck, is peculiarly Lottesque, and yet suggests the influence of Ferrara; while the early Venetian landscape

seen through the window is like Cima in drawing, and like the Lombards in its blue-green coloring. These influences showing in his work were mingled with technical methods peculiar to himself. Thus he had his own method of handling light and shade, his own color delicacy, and, what is more apparent in this portrait, certain mannerisms in drawing. The theory of the late Senator Morelli, that the old Italians had a way of painting conventional features, has been sneered at by his critics, but nevertheless there is some truth in it, if not enough to establish a science. Lotto, for example, was very fond of giving his portraits a peculiar twist of the head, and a side-long look from the eye; his ears were almost always heavy, long, and inclined toward a point, not at the top but at the bottom; his hands and fingers were never quite free from a cramped appearance; and the finger-tips were inclined toward a point with a very singular form of finger-nail. Portraiture in those days did not extend to the minute realization of every individual feature. The examination of a man's work — Bellini's or Titian's, for instance — shows that he used but one formula for all hands and ears. Just so with Lotto. This portrait, compared with those in the Brera (especially the "Portrait of a Lady with a Fan," No. 253), those in the National Gallery in London, or even the sadly repainted Giorgionesque "Three Ages" in the Pitti (engraved in this magazine for April, 1892), will reveal the peculiar methods of the one man.

Those who do not care for the technical analysis of a picture, but prefer to judge by the spirit in which it is conceived and executed, may trace the identity of Lotto in that way quite as well. For, in spite of his eclecticism, Lotto had an individuality of his own, showing in a loftiness of type, an aristocratic grace of countenance, a refinement of feeling, and all through both conception and method a certain nervous quality that is almost morbid in its sensitiveness. Certainly our portrait shows these qualities, and, applying either method of recognition, the microscope of Morelli or the broader intuitive sense of Münder or Cavalcaselle, there is only one conclusion that can be reached about it. It is a work of Lorenzo Lotto, and though it has suffered somewhat from the effects of time and repainting, it still possesses not a little of nobility.<sup>1</sup> Whether it is a Columbus or not, is quite another matter. Perhaps if the reasons for thinking so are set forth, the public will be as capable a judge as the Columbus experts.

Of the many representations of Columbus every portrait with a ruff or a beard is excluded. Neither was worn in Columbus's time. Criticism accepts as possibilities two types of the discoverer. One is the Giovian type, best seen perhaps in the D'Orchi portrait at Como or the Yanez portrait at Madrid. The history of the supposed original is brief and uncertain. Sixty years or more after the death of Columbus, Vasari gave a list of two hundred and eighty portraits in the villa of Paolo Giovio on Lake Como, which Duke Cosimo had Cristoforo dell' Altissimo copy for his Gardaroba. In the list, with Attila, Artaxerxes, Saladin, Tamerlane, and other celebrities, whose portraits must have been purely imaginary, appears "Colombo Genovese." In 1575, engravings purporting to reproduce the portraits in the Como villa were printed, and among them one that still does service for Christopher Columbus. If the real portrait of the discoverer ever was in that collection, it must have been lost or confused with others. The Giovian type shows the face and costume of a Franciscan brother instead of a navigator. For that reason, and because it does not correspond to the written descriptions left by the contemporaries of Columbus, it has not been universally accepted.

The other type is well shown in the Ministry of Marine portrait at Madrid.<sup>2</sup> The Lotto portrait, which we have before us, is an earlier presentation of this type — perhaps the archetype. The difference between the two men shown in the two portraits is slight indeed. It might result from two different artists viewing the same sitter, or the sitter himself seen at two different times or ages, or from the careless restorations from which both pictures have suffered. We see such variations in the portraits of Francis I., and Napoleon I., and even in those of George Washington. This type seems to repeat itself in succeeding engravings and ideal portraits; something of it shows in the Genoa statue; so familiar is it that painters at this day employ it in historical pictures of Columbus; and even the circus people use it in their show-bills. Whether real or imaginary, it seems to be the popular conception of what the discoverer ought to be. Unfortunately there is no absolute Columbus criterion by which we may judge whether it is fact or fiction, but there are reasons for thinking it founded on fact.

It is, in the first place, the Ligurian type, the Genoese type, which the contemporaries and followers of Columbus — his son Ferdinand, Trevisan, Las Casas, Oviedo, Benzoni

<sup>1</sup> Critical articles upon this portrait appeared in "La Tribuna Illustrata," Rome, December 7, 1890, and in the "Rivista Marittima," July and August, 1890. W. J. Stillman wrote of it as a Lotto in the "Nation,"

December 26, 1889, and I am informed that Cavalcaselle, Morelli, Böde, and a number of German experts have given a like opinion.

<sup>2</sup> Engraved in this magazine for May, 1892.

—described in saying that the admiral was tall, well formed, above the average height; his face was long, neither full nor thin, his cheek-bones a little high. He had an aquiline nose, light (gray) eyes, and a fair, high-colored complexion. When a young man his hair was blond, but at the age of thirty it became gray. Las Casas adds that "he had an air of authority," and Benzoni that "his appearance was that of a nobleman." Such a general description is, of course, a rather loose mask into which many faces may be thrust; but the one that fits it best is the Ligurian face. A comparison, feature by feature, will show that the Lotto portrait tallies exactly with the description even in the matter of the gray hair, the gray eyes, the "air of authority," and "the appearance of a nobleman." If the original study for the portrait were made in 1501, as is thought probable, it should find Columbus (according to Harrisse) fifty-six years of age, out of favor with the court, suffering from hardships and misfortunes, and disheartened by ingratitude. Again, the picture corresponds, even in the facial expression of sadness and wounded pride.

The costume in which the figure is clothed has more importance, perhaps, than would ordinarily attach, for the reason that the old Venetians never searched the history of antiquity for appropriate "historical" garments. They always painted what they saw about them, and here in this portrait we have the Italian costume of the Columbus age. It is the first time that it appears in any portrait of the discoverer; and the second and only other time it appears is in the repetition, the Ministry of Marine portrait. Carderera, in his "Informe sobre los Retratos de Cristobal Colon," says of the costume of the Columbus period, that for the better classes "the hair was as long as to cover the ears, and cut in a horizontal line; the shirts had thin folds, and a collar which was no higher than a finger is thick; the coat was long to the knees, and the collar was cut out square around the neck, or the breast was cut out square. . . . Mantles were long, and fell to the ankles, with broad lapels, and had slits or openings at the sides." Had he added that the lapels were of silk or of fur, it would seem as though his description had been taken directly from the Lotto portrait, for it fits it in every respect. It is, in brief, the Italian costume in the late fifteenth and early sixteenth centuries for well-to-do or noble people, and may be seen at this day in the Venetian pictures by Bellini, Carpaccio, Cima, and their contemporaries.

But to come a little nearer to our search, this Genoese, with "an air of authority" and a tinge of melancholy about him, who looks out of his canvas with such a reproachful, half-disdainful

look—this man is a navigator, a commander. The lines of the face are those formed by exposure to all sorts of weather; the bronzed, tanned look of the skin is the result of salt air and southern sun; the very eyes, with their keen, narrow look, are those of a "lookout" at sea who blinks in the fierce light of noonday beating on the ocean. But, above all, if he be not a navigator, why the attributes of the craft about him? In the left hand he holds a log-glass. It is not an hour-glass, but a log-glass, which runs from fourteen to twenty-eight seconds, and was used in connection with the log-line to ascertain the speed of a ship. It rests upon a book, and that book is marked on the back "Aristotel." Aristotle and Strabo both taught the spherical theory of the earth. It was the influence of Aristotle and his interpreters that kept alive during the middle ages the doctrine that India and Spain were not far apart; and Mr. Tillinghast informs us (Winsor, Vol. I, p. 36) that Columbus certainly knew of these sources. Whether he did or did not would have made little difference to the painter. He had to portray a believer in the roundness of the earth. Aristotle was an ancient authority for that belief; hence his volume was an appropriate symbol—particularly appropriate for the man who first put the spherical theory to a practical test. Another symbol, that of the Indian in the red cap at the right, was unfortunately cut away, and cannot be spoken of now. There was probably some confusion in the painter's mind between the Indian brought to Venice by Cappello as a present to the Signiory in 1497 and the Moors of western Africa. The error of thinking them of kin was popular at that time; hence the red fez, which might, indeed, have been worn by Cappello's Indian while in Venice.

If there is any possible doubt about the book, the log-glass, and the Indian symbols, there is none whatever about the attribute in the right hand. It is a map—a map not of Africa or India, but of the New World, the West Indies discovered by Columbus. What possible pertinence could there be in placing this map of Columbus's discoveries in the hands of another person than Columbus himself? He holds the map half unrolled to the view as an evidence of his achievement; in the hands of any other person, say Vasco da Gama, Magellan, or Vespucci, it would look like downright theft or false pretenses. During the life of Columbus, and for many years after his death, no navigator would have dared to appropriate to himself such a symbol. The discovery of the West Indies was the peculiar glory of Columbus, and even modern historical criticism, which has pilfered from him everything else, including ability, honor, and common decency, has

not disputed his right to that. And yet not quite all the land upon the map was discovered by Columbus. The map was of course sketchily painted, as the symbol of a navigator, not for cartographical purposes; but nevertheless the degrees of longitude, the outlines of the islands, and the names, may be easily traced. The names that appear are Spagnola (Hayti), La Dominica, Moferrato (Montserrat), Canibalorum (Cannibal Islands), and at the bottom Terra Sancte [*sic*] Crucis (Brazil). But Brazil was not discovered by Columbus. It is usually conceded to be the find of the Portuguese Cabral in 1500. How does it happen, then, that he holds a map showing a discovery not his own?

All the discoveries on the map were known in 1500. Columbus died in 1506. The earliest engraved map of the New World now known to us is the Ruysch map, published with the second edition of the Rome Ptolemy in 1508. The map in the Lotto portrait (the portrait is dated 1512, it will be remembered) is very like the West Indian portion of the Ruysch map, except in the omission of some important islands and in the spelling of some of the names. It is not impossible that Lotto used the Ruysch map, because it was in existence in his time, and that he copied the West Indian portion of it, indicating at the bottom the Terra Sanctæ Crucis, ignorant or careless as to whether Columbus did or did not discover that particular country. From the painter's point of view, there would be nothing unusual or out of the way in his doing so. But if such were the case, why did not Lotto likewise copy the spelling? Why Canibalorum for "Canibalos In," and Moferrato for "Moferrato"? Why were Matinina, and Tamaragua, and other names and islands on the Ruysch map omitted entirely? Did Lotto reproduce Ruysch's map, or was Ruysch's map an enlargement of that now lost map brought to Venice for Domenico Malipiero by Angelo Trevisan in 1502—a map which Lotto must have known about and possibly copied in this portrait?

Angelo Trevisan, secretary to the Venetian Embassy at Granada, had been requested by Domenico Malipiero, the Venetian senator, admiral, and historian, to obtain for him a map of the newly discovered countries in the west, as appears from a letter of Trevisan's to Malipiero dated Granada, August 21, 1501. In that letter he speaks of his intimacy and friendship for Columbus, who was then at Granada, poor, and out of favor with the sovereigns.

Through him [Columbus] I have sent to Palos, a place where only sailors and men acquainted

with Columbus's voyages live, to have a map made at the request of your Magnificency. It will be extremely well executed and copious, and minute in respect to the newly discovered country.

Further on he speaks of its size preventing the sending of it; Malipiero must wait until Trevisan returns to Venice. In the mean time he sends a free Venetian translation of the first book of Martyr's "Decades of the Ocean," containing the first three voyages of Columbus, and promises the others. Probably Malipiero had no direct interest in Columbus. As a historian and a Venetian senator, he wanted complete information regarding the New World—perhaps to promote Venetian commerce. Possibly Columbus did not know about all the land discovered, but the Venetian Embassy in Granada did. It knew about the discovery of Terra Sanctæ Crucis by Cabral through its secretary in Portugal, and through the letter of the King of Portugal to the King of Spain (dated July 29, 1500, and printed in Rome, October 23, 1500) announcing that discovery. In August, 1501, Trevisan promises to make the map "as copious and minute as possible"; therefore he sends to have it made at Palos. Why, if not that he finds there map-makers familiar with Portuguese as well as with Spanish discoveries? There was no need of sending to Palos for Columbus's charts, because Columbus had his charts with him at Granada, where Trevisan was located. It was evidently Trevisan's object to have the map show not only the islands of Columbus's discovery, but *all the discoveries*. It is extremely likely that when the Embassy returned to Venice in 1502, Trevisan's map had, besides the West Indies, the outline of Terra Sanctæ Crucis (Brazil) upon it, and that Lotto used the map for his portrait. It is not positively known that such was the case, for all trace of the map is now lost; but one slight thing seems to connect the Lotto map with the Trevisan map, and intimates that the one was merely a painter's copy of the other. In 1504 Trevisan's Venetian translation of the first book of Martyr's "Decades" appeared under the title of "Libretto de tutte le Navigazione del Re di Spagna," and in it the spelling of the names of the countries is the same as that upon the map in the hand of the Lotto Columbus.<sup>1</sup> Why the map made at Palos, a Spanish port, should have Venetian and Latin names upon it corresponding to the spelling in Trevisan's "Libretto," is explicable only on the ground that Trevisan so ordered it, knowing that the map was for Venetian use. That Lotto should have copied this map with

in Venice. The "Libretto" was republished with Cabral's voyage and other matter in the "Paesi novamente ritrovati," Vicenza, 1507.

<sup>1</sup> This information is furnished me by Signor della Rovere, who has had access to the only copy of the "Libretto" in existence, in the library of St. Mark's

Terra Sanctæ Crucis upon it, or that he should have varied the Ruysch map, using either the one or the other as a symbol of Columbus the discoverer, has nothing of the improbable about it. To paint what was before one, regardless of chronology or exact historic truth, was the story of all the Renaissance art.

There is no record that Lotto ever was in Spain or ever saw Columbus. Such things were not matters of record. There are only some half-dozen dates in Lotto's whole life, and these come mainly from churches that had paid money for his pictures. From the different towns in which these dates appear it would seem that Lotto was a wanderer over Italy at least. From 1500 to 1503 no one knows where he was. He might have been in Spain, as he was, later on, in Rome and elsewhere. He may have sketched Columbus from life and never finished the picture until 1512. Such things were not infrequent then, nor are they now. It is more likely, however, that Trevisan, the intimate friend of Columbus, who had the elaborate map made for Malipiero,—a map so large that he had to take it with him to Venice in his luggage,—also brought with him some sketch or portrait of Columbus as a complement to the map and as

a present to Malipiero. Trevisan's one-sentence description of Columbus prefacing his "Libretto," and reading "Christopher Columbus, a Genoese, high and tall, red, very clever, with a long face," seems insufficient and meaningless unless accompanied by a sketch or portrait of the man. It is not improbable that such a sketch or portrait served as Lotto's model for this larger picture. Lotto was certainly well enough known in 1512 to obtain such an order from Malipiero or Trevisan. Later on his intimate companion, Palma Vecchio, was working for a branch of the Malipiero family; but whether Lotto ever did or did not can only be conjectured.

Such, in brief, is the present evidence for the Lotto Columbus. It is not conclusive, because the portrait has outlived its record, and stands to-day, like many another Renaissance portrait, the sole witness in itself for itself. The type, the costume, the attributes, the circumstances, point toward a likeness of Columbus; that is all. Circumstantial or hearsay evidence is all that has ever been brought forward for any portrait of Columbus, and perhaps it is not too much to say that the evidence for this one is quite as strong as for any other in existence.

*John C. Van Dyke.*

## DARE-THE-WIND.

"Western people have a proverbial saying that the blue-grass springs up wherever an Indian has stepped."—J. J. PIATT.

**B**LUE-GRASS dancing to your shadow  
Lightly swaying o'er the sod,  
Do you spring up in the meadow  
Where an Indian foot has trod?

And is this the mystic sun-dance,  
Feathery-crested Dare-the-Wind?  
Or the thank-reel for abundance  
Of tall maize in stacks to bind?

Doughty brave, afraid of no man—  
Ha, your blade is tipped with red!  
'T is the blood of dusky foeman  
In some old-time battle shed.

Light and lissome, tall and slender,  
Pluméd chieftain of the soil,  
Ay, you dance the war-dance furious  
Ere you dash into the broil!

Silent, Dare-the-wind, and sulky?  
Come, your secret have I found?  
You're the ghost of Indian warrior  
Sent to guard yon Indian mound.

*Alice Williams Brotherton.*

## THE CHOSEN VALLEY.<sup>1</sup>—VI.

BY MARY HALLOCK FOOTE,

Author of "The Led-Horse Claim," "John Bodewin's Testimony," etc.

WITH PICTURE BY THE AUTHOR.

XVIII.

"UDE be thankit!" cried Margaret, opening the door to Dunsmuir. "Come awa' in out o' the stour."

Again the dust-wind was raging up the valley, that last day of a pitiless September long remembered, even in a patient land, for its brazen days, and stifling nights, and ceaseless storming winds that brought no rain, but "stour."

Squaw Butte and the War Eagle had not been seen for weeks, so close fell the curtain of smoke from burning forests. Hundreds of acres to the north and east were on fire, turning the sun's light to a ground-glass glare, and troubling the heated atmosphere. The evening before a false wind blew up from the plains; the clouds sulked all night, and promised rain; next day a lurid sun peered forth and vanished. The desert wind arose, and the dust-cloud marched before it, and, as it drew near, fields and fences were blotted out of the landscape, houses looked like stranded hulks, and trees like staggering masts, and which was earth and which sky no eye could distinguish in the yellow darkness.

Dunsmuir had had what Margaret would have called a warning that his errand to the homestead must not wait. He traveled ahead of the storm, which broke upon the ranch at three of the afternoon. He could scarcely see the house from the stacks where he tied his horse. There was neither barn nor stable, no shelter for the few poor cattle, no roof to the well, no porch to the bare, little two-roomed cabin. Yet it was a home, and a great sorrow had come to it. Dunsmuir had no need to ask its nature. That helpless man-shape sunk in a chair, propped back, with a comforter tucked around him, was Job. His feet were in a tub of hot water, which steamed up into his white, drawn face, and eyes of speechless appeal turned from one to the other of the two who looked at him as if he were already not of this world.

"When did this happen, poor woman?" said Dunsmuir, giving his sympathy, as we do, to the mourner before the sufferer.

"'Deed, I think it's an hoursin' he was taken; but I cannae rightly say, I have been sae crazed wi' the storm an' the heat an' the sair wark o' handlin' him—ma paur mannie!"

The heat was something fearful. The house had been shut tight against the laden gusts, which shook the feeble door, and beat upon the windows, and cast the dust of the valley road upon the roof, like ashes on the head of a mourner. Margaret had crammed the stove with dry sage-stumps in her haste to prepare the foot-bath; she had put mustard into the water, and the odor of it was sickening in the close-shut, reeking room. Her face was purple, shining with tears and perspiration, and twisted with grief. She knelt and lifted the pulseless feet into her lap, and dried them, and cried a little as she showed the towel—one of the fine ones "the child" had given her, with her mother's own maiden name wrought upon it. Dunsmuir helped her get the helpless bulk into a bed, in the other room, which Margaret had hastily spread with clean sheets; and again she could not pass over without calling attention to the comforts Dolly's mindfulness had supplied, so grateful now to her fond, simple heart. It pleased her that Job should lie upon the finest and softest of linen and feathers, provided by her whom they loved as their own child.

"He'll come out of it, Margaret," said Dunsmuir. "I think he knows me." And he went up close to Job, and spoke to him as to a child, asking him the question. They knew not how much of Job was there to hear, even without the power to answer. It were better he should remain without the doors of consciousness, than reënter, to behold the ruin that he was. Job made a feeble motion of his left hand toward the right, which lay as it had fallen when they placed him on his back in the bed. Dunsmuir lifted that awful dead member and laid it across his chest. A look of greater ease crept into the strange, familiar face on the pillow. "You know me, Job?" Dunsmuir persisted, in the forlorn attempt to comfort Margaret. "He knows me, see!" Job had fixed his eyes upon Dunsmuir's face with a stare that had something like intelligence in it. His mouth worked, but he could not articulate.

<sup>1</sup> Copyright, 1892, by Mary Hallock Foote.

Still, it was plain that the stroke was not to be the final one. In the outer room, while the drear wind tormented the valley and blotted it from their sight, Dunsmuir made known his business.

"Here," said he, "is the last of the money that's so long overdue; and it comes none too soon, my poor woman. I suppose you would not have asked me for a penny, however ye were?"

"Indeed, an' I would," answered Margaret. "That's no way o' my pride. But ye need na cum'er yoursel' wi' us. We have made out vera weel, as ye can see. We have wantit for naething in reason. And I'm just thankfu' that we cam awa' here to oursel', as he was aye fleechin' an' beggin' me to do. He'd a hankerin' to set the place in order, or ere he left me to fend for mysel'. I'm thinkin' he'll have had his warnin'."

"You put shame upon us all, Margaret, when you talk of fending for yourself. Who was it stood by me in the mother's place to my children, with all the mother's cares, and none of her honors or blood rights? I shall never try to tell you how it fared with me to see you go out of my house without even your money wages in your pocket. You'll give us the right now to show you're something more to us than a chance comer and goer. Come, I must have your promise that you'll let me know, from this forth, whatever you're in want of. So far as I'm able, I'll see that you get it."

By four o'clock the wind had moderated so that Dunsmuir was able to set out home again and to send a messenger for the doctor. He had proposed to come back himself and to spend the night; but Margaret seemed so distressed at his taking such unwonted trouble, that he wisely substituted the offer of Dolly's company, with a trusty man to stay by the ranch. It was easy to surprise Margaret's wishes now; she was off all her guards at once, and softened to the simple truthfulness of grief. She accepted what she wanted, and was fearless in refusing.

A fair, rosy evening followed the storm. There had been rain higher up, on the mountains, and the freshness had descended without the moisture; gusts of coolness scattered the dry roses and rustled the withering vines. Philip very definitely proposed to be the man who should accompany Dolly and watch with her at the ranch. And Dunsmuir, who depended on him, though he might not own it, was thankful for his offer. Philip hurried to change his dress after dinner. He heard Dolly at the trunks in the attic, and went to the door, as once she had come, to see what was doing in there. She was hunting for an old dressing-gown of her father's, also for certain

pairs of fine woolen socks Margaret had knitted for him one Christmas when he had complained of cold feet, and he had unwittingly hurt her feelings by never wearing. She thought with awe of Job's condition, that he should need to be warmed in such weather. She was as red as a poppy with the heat and perhaps from other causes. She was in her dressing-sack; but to Philip's untutored eye there was no suggestion of dishabille in the pretty white jacket sprigged with roses, which showed a pair of arms he loved to look at, whether bare or sleeved. He longed to do all manner of wild homages to Dolly—to her arms and hands and feet and little fair head of tumbled hair. She was in a great fuss and hurry, trying one trunk after another; she grew troubled in her search, partly at Philip's help, which confused her and made it impossible to think or to remember.

In the third trunk they tried, the upper tray was filled with a large, soft, fragrant bundle that rustled richly and smelled of lavender and attar of roses.

"What can this be, laid away so preciously?" Philip smiled, with man-like curiosity, quickened by his flattered senses. "This must be the offering of the wise-hearted, in 'blue and purple and scarlet and fine linen.' Might one take a peep? This is surely the odor of sanctity."

Dolly shrinkingly owned that it might be—it was her mother's wedding-dress. And Philip abased himself in silence. She permitted him to lift out the long tray, and, as he did so, one end caught, and came up with a jerk that sent a small parcel to the floor.

"Oh!" said she, "I must show you these—Alan's and my christening things. You'd never believe what pretty clothes I once wore, before I was a beggar-maid. But perhaps this is too childish?"

"I scarcely know you any more,"—Philip pretended offense,—"you have so many doubts and primmy notions. Once you were not afraid to be childish."

They bent together over the small, soft bundle as Dolly unpinned it on her lap, and displayed the ridiculous proportions of the tiny garments, doting with a seamstress's enthusiasm on their exquisite finish. She explained the mysteries of lace tuckers that folded down, and sleeves that looped up, and held one frock beneath her chin to show its sumptuous length from bib to hem of loveliest needlework, and every stitch set by hand. A subtle rich perfume, long laid away in the yellowing folds, stole forth upon the garet's tropic warmth. It spoke to them of memories merged in dreams, of a future tremulously foreshadowed. Philip, half intoxicated by the intimacy of these researches, was the only conscious one;

Dolly was simply girlishly flattered by his impassioned interest in her sartorial past. These pompous little robes had been the delight of her earliest visits to the attic; but the wedding-gown had ever been hedged about with careful ceremonies and precautions. No hands but Margaret's had ever ventured to unfold those lengths of shimmering satin and creamy drifts of lace, nor could Dolly realize that she was now sole keeper of the garments in which the sacred mother-past lay folded away. Something of this she tried to say; for Philip was one who seemed to understand everything.

"I have almost a guilty feeling, do you know, when I come here and rummage by myself. All the history of our poor house lies packed away in these trunks, ever since it stopped in the cañon, and nothing more happened. All my mother's happy girl-days were put away here, with her evening-gowns, and her pretty shoes, and fans, and sashes; and here"—Dolly laid her hand softly on the wedding-gown—"she was a bride; and here, a mother; and then it was all over, and Margaret locked her trunks and has kept the keys ever since. And we children never really knew her. We have no right here, do you think?"

She was sitting on the closed trunk-lid, the keys hanging from her warm hand, blanched with the heat and tremulous from exertion. Transported by that unconscious "we," Philip bent and kissed the hand—only the little finger of it that lay apart. It was his one transgression. Dolly turned her face away; the tears sprang to her eyes. Poor Margaret! Had she forgotten Margaret, who never would have forgotten her? Her look put Philip far from her, and he was moved to say humbly:

"Would you rather some one else went with you to the ranch?"

"Why should you think so? and who else is there to go?"

Philip smiled; it was hard to wait. He looked at her troubled face, all flushed and weary with a childish abandonment, and thought of all the Rests, as many as the Joys of Mary, with which they could rest each other. She needed the rest of change; and quickly he was rapt away in his besetting dream, of two young student lovers,—he with the better grasp, she with the subtler feeling,—nesting in the old cities of art and learning, always referring their work to the special requirements of the life awaiting them at home. He felt himself not content to be merely a builder of ditches; he looked forward to being an administrator of waters in the new communities water should create, and here came in the human element which immensely enlarged the scope of his work and of her helpfulness.

That night at the ranch Dolly watched him

fetch and carry for Margaret the wood and the water, and gravely consult with her about the chores. She heard him speaking words which seemed inspired by the most delicate discernment. She saw him with Job's head against his shoulder (in the name of all pity, what a contrast!) while Margaret fed medicines into the relaxed mouth that could neither protest nor thank her any more. She jealously watched for a sign of repugnance, or condescension, or relief when the ordeal was over, and saw him always simple, sensitive, and brotherly, through all the discomfort, and sorrow, and squalor of the night. She saw, above all, that Margaret accepted him with the sure instinct of grief, taking his presence and his most intimate services as much a matter of course as her own. Dolly was comforted in her instinctive faith. Her proofs were sufficient to herself. He might have come of shabby ancestry, he might have cared and ceased to care; none the less he was a friend, a gentleman, a comrade she could give her hand to in joy or sorrow, and her people were his people and her poor were his poor.

Philip went away next morning after breakfast, saying he would return or send some one in his place to spend the night. Breakfast had been early; at ten the doctor made his visit; the remainder of the day seemed endless. After the supper-things had been set away, Margaret lay down beside the sick man, and fell asleep. Whether Job slept or not Dolly could not be sure; he lay quiet with closed eyes. She went out and walked about the dusty premises, the roosting fowls inquiring concerning her presence with querulous squalls and sidelong duckings. She walked from the door to the fence and back till she knew every weed by the path. At the gate she would stop and look up the cañon road; then she restricted her looking to every other time. Now and again she opened the cabin door and listened, and heard only the clock ticking and the kettle rising to a boil. She had wearied herself with walking, and was going in when she saw Philip dismounting at the gate; he had come across through the sage-brush. He walked beside his horse up the dusty path, and she went out gladly to meet him.

With an odd, embarrassed smile, in silence he handed her a letter. It was addressed to her father, and it had been opened.

"Did you know it was from Alan?"

"Oh, yes," said Philip; "your father read me parts of it." Dolly thought his manner very peculiar.

"If the news is bad, I wish you would tell me first."

"There is news; but I don't know if you will call it bad."

"Does papa?"

"Well, yes—rather. Will you not read the letter? There is nothing shocking in it."

"There are pages and pages! New York, September 25. Has n't he sailed yet?"

"Won't you read the letter, Dolly?"

"What is all this about Estelle? Who is Estelle, for pity's sake?" Dolly had gone to the root of the matter.

"Estelle Summencamp. Don't you remember—the people who were here last summer, whom Alan met on the train?"

"Oh, *that* girl! Has he been with them all this time in New York? and is that why he has not written?"

"It's hardly fair to Alan not to read what he has to say for himself. I'm sure you'll find it interesting."

Philip walked away, leading his horse. Dolly, angry and alarmed and sick with a new, ridiculous foreboding, read on, page after page of excited boyish narrative: I came, I saw, I conquered! Dolly was cold to his jubilation, for now she knew what was coming.

"She swears she is five-and-twenty." [This sentence caught her eye, as she hurried along.] "I don't believe it; she does n't look as old as I do, but she knows a precious lot more about everything except riding. We ride every day in the Park; it's awfully dear, but they don't seem to think of the cost of anything, and she says she likes me on horseback. . . . Amongst them they've got about twelve hundred acres of land. . . . I shall take up my land next theirs; Mr. Summencamp says they will have a railway station and a town directly on the lands. . . . It's gone out that I'm a younger son—British aristocrat—making money hand over fist in Texas cattle. *They* don't mind, but I think I see my father smile."

Dolly put down the letter with a flushed and burning face. She was too angry to cry. So Alan was to marry the girl with the laugh; they would go laughing through life together. And all this had been transacting while, in the cañon, days were counted till the coming of his letters, and her father walked the floor at night, as she had heard him, hoping and planning and wrestling for his son. She pushed the cabin door ajar, for she longed to talk it over with Margaret, who had the sure touch in trouble. All was still but Margaret's heavy breathing.

"Na, na," she muttered in her sleep, "he wad be shoggen a' to pieces. I could na bear to see it."

The lump rose in Dolly's throat. She felt, as never in her life before, how poor they were in numbers, how isolated from larger circles where life was a bustling business, and people made new friends and broke with old ones every day. How easily Alan had affiliated

with all that seemed so hostile, so insolent, to herself! All the world to Dolly was made up of Summencamps, and their money and their plans and their pleasures. She had no heart to go on with Alan's rank rejoicings. In the stillness of that smitten place there was almost a ribald tone in his talk of dinners, and theater-parties, and roses at a dollar apiece, and new clothes, and new friends who had never heard of the cañon or the scheme. Philip came and sat beside her, unbuckling his spurs, and knocking off the dust on the door-step.

"Why do you take it so seriously?"

"She is five-and-twenty, and he is not nineteen, and they met on the train, and were engaged two days after they reached New York. And he thinks her father and mother are delighted. If they are, they are very strange people."

"Alan is a very sweet boy," said Philip.

"Oh, he is, he is! He might have been," sobbed Dolly, breaking down. "But now he'll never be anything but a hanger-on of those people."

"They are the same age inside." Philip tried to comfort her. "I spent a day with her myself, remember. She is very jolly, and clever as girls go, and you can't deny she is pretty. And they have a power of money."

"So you think because she is pretty and rich it must be all right!" cried Dolly, scornfully.

"I think it might be much worse. 'Better not be too proud.'"

Her lips trembled. "I know very well what you mean. You think, with poor Alan, the most we can ask is to be defended from the worst. But, except for Pacheco and all her squalid connections, I'd sooner it had been Antonia."

"O Dolly, no! There are possibilities with a Miss Summencamp, but none with an Antonia. Miss Summencamp may be the very means appointed for Alan's discipline. Come, Dolly," he said, rising and offering his hand; "come, you must brace up, you know. You will have to comfort your father. He hates it rather worse than you do."

They walked on toward the gate together, Dolly clasp and twisting the letter in her nervous hands.

"Is n't it pitiful, is n't it absurd! One can't have even the comfort of calling it a sorrow! Alan could never do anything that was expected of him. And what will be the next thing, I wonder? Margaret has always said the price would be required of us, if ever we should get our great wish. The work is going on; all has come to pass that we used to pray for—but there is Alan's cap on the wall, and papa does not look as if success agreed with him."

"Dolly, you are not going back on the scheme?"

"Ah, it costs too much. And it may not be for us, after all."

"That should not matter. And we are in it now for all we are worth. When a thing like this gets started it runs those who thought to run it. Don't go in yet; it is all quiet in there. You look as if you needed a walk. Take my arm?"

"No; people must walk wide apart in this dust."

"Take my hand, then."

"I need both hands for my skirts."

"Fiddlededee your skirts! I never saw a small person so occupied with her clothes. You should wear buckskins, like a little squaw, and then you could trot alongside and kick up all the dust you pleased."

"If I were a squaw I should trot behind."

"Not if you were my squaw."

Dolly's chin went up, and she walked wider than ever; but she was no longer quite so melancholy; and presently she began quoting, in a tone of high derision:

"We twa ha'e paidlet i' the burn  
And pu'd the gowans fine.

"How Margaret used to love to sing those words to us, who never heard the sound of a burn in all our lives! And she from a country that sang and shouted with water!"

"What does it matter where we do our paddling? It 's whom we paddle with. I can fancy just as good paddling in this dust of the plains as in any burn that ever brawled; only I should paddle on horseback, with my squaw on a pony beside me. Come out where we have n't these lines of fence-posts in our faces. Hark! How still it is, after the cañon!"

Night was falling, the clear sky of the desert darkening slowly without a cloud. Dew on the pungent sage dampened the dust and gave strength to the air they breathed. A bell-mare hopped somewhere in the brush clanked flatly as she stepped. Coyotes raved in the far offing like a pack of demented dogs. Against the low, bright west loomed a cowboy shape, enlarging in a spurt of dust that unrolled and drifted to leeward. He veered and passed them afar, and the beat of his horse's hoofs throbbled, fainter and fainter, long after the dust hid him.

"Dolly," said Philip, "don't forget what we are here for: this is the land we are going to reclaim. Can you not fancy it—miles and miles, at sunset, shining with ditches, catching the sky in gleams; and the low houses and the crops, and the dark lines of trees reflected in the water-channels? You will like it when you see it, and I should n't be surprised if you called it home. And if there are no burns, there will be gentle, sober ditches. Our waters shall do their singing and shouting up in the

mountains; they come down here on business. Your burns are nothing but mad children. Ditches are tender, good mothers, taking thought where they go, not ripping and tearing through the land. Oh, you will like it, and one day you will own it for your country. You are a 'bunch-grass belle,' Dolly, however you may boast of your heather."

## XIX.

By the following spring Job had so far recovered from his stroke as to be able to sit in the rude wheeled-chair contrived for him, in front of the cabin in the sunshine, and to watch Margaret digging in the garden, or watering the calves, or hanging out her wash on the lines Job had put up for her in the days of his usefulness. A neighbor had taken the management of the farm "on shares," but, with the chores and the housework and the care of the invalid, Margaret's hands were full. The doctor had said that Job might be with her in his present condition for years, or he might be smitten again without warning, and pass away in a few hours. His speech had not come back, beyond a few drear mutterings intelligible to no one but Margaret. When they were alone she talked to him as a child to her doll, or as a mother to her speechless but sentient infant.

One afternoon, close upon the finish of the cañon work, Dunsmuir sat and talked with Margaret in the door of the claim-cabin, and between them, bolstered in his chair, was that sad effigy of Job. Spring had changed everything since the day of the gray September dust-storm. The little house stood low, on the edge of a rich bottom grown up in wild grass. The willows and cottonwoods had leaves large enough to cast shadows. From the mesa, where Job's main lateral plowed along, the brown, seeded land fell away, like a matronly lap, toward the river. The wheat looked well, considering the unfavorable spring, which is ever the lot of new settlers; but the orchard, planted with trees the size of walking-sticks, was needing water badly. There had been a week of hot, drying winds, most untimely; snow was going fast on the mountains, and the river tumbled by the vivid meadow-grass in a yellow, seething flood.

Dunsmuir praised Margaret's management, and promised her a 'lot of stuff' for her garden another year. He had grown used to Job's nonentity, and talked across him, cheerfully, as if his chair had been vacant. But Margaret noted every subtle change in the face of her invalid, and whenever a wan, unrestful look of his sought hers, she had always some comforting expedient in reserve.

"I'm charged to tell you," said Dunsmuir,

"that we can never do without you in these preparations for the great day. Dolly is in a dozen quandaries, and has no one but men to advise with, and the cooking will all 'gang agley' without Margaret to superintend; so what's to be done? Cannot we fit up one of the wagons as an ambulance for Job, and move you both, stick an' stow, up to the house till this mummy is over? Job must see the head-works before the gates are shut. Eh, Job?"

"Na, na; it's not to be thought on," Margaret interposed.

"Well, then, you must think of some trusty woman with a good skill at the cooking. It is far too much to put upon Jenny and a young mistress like Dolly."

Dunsmuir fell into Margaret's way of speaking, in talking with her since her trouble; it was the expression of his nearness. Every shade of misconception had passed from between them; there was even a greater ease and kindness in Dunsmuir's manner. He was more himself with them at the cabin than with any who knew him, even his daughter. And he was more outspoken with Margaret about his own affairs than he had been while she was one of his household; for now he was freed from her anxious feminine oversight, and from the pressure of one-sided obligations.

"I'll may be no ken the new ways o' the house," said Margaret, ignoring the possibility of another woman, "with a' this cum'ersome work going forrit, and the look of everything changed. I hear ye have built a new stable."

"Nothing of the sort; we have built a bridge from the house to the old stable, to save pulling and hauling across the gulch. There is nothing changed about the house, and the ways are the same ye have known going on for twenty years. Why, Job will be blithe to spare you for a day, with a neighbor body to wait upon him. It is not the work,—we can get hands enough,—it is a head that is wanting. There'll be twenty people to luncheon at the house, and tables in the tents for the crowd. Dolly, the child, knows nothing how to provide for such a raff of folk, and my way is a man's way. She would know every detail beforehand, and she is thrifty, and grudges the waste that comes of loose providing."

"Gude save us! and is a' that to come out of the family?"

Dunsmuir chuckled over Margaret's prudential alarm. He teased her a while about the expenses of the forthcoming entertainment, and then confessed it was the company's affair.

"But we must do our part, if only for pride's sake."

"And do ye think, now, that it's worth while?" she shrewdly asked.

"Why, if advertising be worth while—it is

an advertisement of the canal. The manager knows his business. The trouble is, he thinks he knows mine. The water is to be backed against the dam to make a show for the people, when the lake should be a month, at least, filling up. But the powers have ordained that we celebrate."

"And what will they have to their program?"

"It will be a Fourth of July, wanting the powder. The head-works are the 'grand stand' for the principal guests and the speaking. There will be plenty of bunting and brandy and soda; and the city band will be there; and Price Norrisson will address the meeting. And the ladies will cast their bouquets into the canal-bed, as the water is turned in,—a marriage, you see, of the river and the ditch,—and my poor girl is to cast the first one —"

"Eh, sirs! an' will ye allow that, an' before a' that crowd o' strange folk?"

"Well, if the thing must be done, I know no other lady who could be bridesmaid to the ditch unless it's yourself, Margaret. You might do it to spare Dolly; though, as a fact, I think the poor child is pleased. She takes it all in good faith, as she should. It's only here by ourselves that I dare to sit among the scorners. But the cream of the joke will be Norrisson's oration. He is to father the whole concern. He will give us the progress of Irrigation (with a capital I) in this region, with a history of our own canal, for the benefit of the press reporters. He will spread it from the Atlantic to the Pacific, and by the next steamer's mail to the other side; but there will be a searching of hearts in the audience, I am thinking. There are a few of us who could give him points to help him out with his tale. Here, God pity us! is a weary page of it." Dunsmuir laid his hand on Job's nerveless right arm. "Tons and tons of rock lie bedded in the river that this white, bloodless hand sent smoking down the glen-side. Ay, if we had the rock and the stone piled in one heap that Job has moved off the canal-line, it would build him a cairn fit for a chieftain's monument. Job's hand should have been the first to raise the head-gates; but now the force has gone out of it, and I must take hold beside Norrisson."

"Eh, sirs!" cried Margaret, again, all her partizan blood uprising. "And is that, do you think, as it should be, now?"

"It is as it is," said Dunsmuir. "I may let go, if I choose to sulk in public, but Norrisson's fist will remain; it has a healthy grip upon most things. Have you not learned that in this country the engineer is the hireling, not the counselor? It's money that builds here, not brains and education. Norrisson will be the great man of the day. And we that strove mightily shall eat and drink as friends. But you will come,

Margaret, and take a glass with me in silence to the memories we two are left to keep?"

"Na, na; I'll drink nae glasses," said Margaret, wiping away a quiet tear that started as he spoke. "Let them eat and drink as maun, to show their gude wull. There's nae need o' that amang friends. But I will come for a day before the day, and gi' ye what help I may."

"And will you not come and look on at the feasting? You will never have seen so many people together since you came to the cañon."

"Na; a feast is no a feast to me wi'out my auld man is there."

"You speak like yourself," said Dunsmuir. "Well, good-by to you both—honest friends as man ever had in this world. Do you think he follows me, Margaret?" Dunsmuir laid his hand affectionately on Job's as he spoke, and looked long, with a sorrowful questioning, into the dumb-stricken countenance.

"He is there the same as ever," said Margaret.

"Yes; he is there," said Dunsmuir. "Nor more estranged from us than we, that can speak, from one another. There are bonds and bonds, Margaret, woman; and where is the soul clothed in flesh, and the desires of the flesh, that can call itself free? Job, I'm thinking, is nearer his freedom than any of us."

xx.

"Look out for the water at the ranch tomorrow evening, Margaret."

"Gude save us! will it be a' that while on the road?"

"It will, and longer if I had my way of it."

"Are ye afear'd the banks will not be strong enough to tak' the first flood o' 't?" Margaret asked in an anxious whisper. She was already in her place beside the driver on the single seat of the buckboard, having characteristically refused to stay to dinner, or to have dinner earlier, after working like three women since nine o'clock on that toilsome day before the day.

Dunsmuir smiled at the precautionary whisper, not to spread her fears.

"There is no first flood in a new canal, woman. It's plain ye were not raised in a canal country. The water creeps in like a baby taking its first steps. It must walk before it can run."

"Fair fa' its steps, then," Margaret ejaculated. "But, sirs! it is a fearsome business." She turned her reddened, earnest countenance upon Dunsmuir as he stood smiling, with his foot on the fore wheel, hindering her departure.

"What is there fearsome about it? It is an old, respectable business as any on the face of the earth. You may read of its works in your Bible."

"I have read how the Lord proved Moses

at the waters of Meribah," said Margaret, solemnly, "for that he smote, and sanctified him not before the people. And do ye mind what was the judgment? 'Yet shalt thou see the land before thee, but thou shalt not go thither into that land which I give to the children of Israel.'"

"Ye are grand at the Scripture, Margaret, but I can cap your judgments with the promise that stands fair for all irrigators of the desert. 'He that watereth also himself shall be watered.' We make no pretense to be leaders, or lawgivers, or guides to the people in their wanderings."

"Ah, ye are daffin' when ye had far better be prayin'. It disna set wi' my way of thinkin', sic a day o' muckle eatin' an' drinkin', wantin' the thanks due to the giver of a' things. There's a mony mair warnin's than promises in the Scripture set over against that word water. The Lord Almighty makes it his boast that he holds them in his hand. Do ye mind how he answered Job out o' the whirlwind, speerin' whaur was he when the sea brak' forth an' the clouds were its swaddlin' band? He that presumes to know the ordinances of Heaven; that brak's the seal o' the auld, ancient, fearsome waters, to turn them from their given course—he'll need to mind!"

"Well, can't you give us a better word than that for the last one?" Dunsmuir held out his hand. To his surprise, Margaret was speechless. She wiped her hand hastily on her apron, and gave him a hard, warm squeeze, and then broke down completely, and began to weep.

It was partly the sight of the cañon, as she was leaving it, at the hour of its most solemn beauty, for the place was home to her. But Margaret had also a superstitious fear of success coming to one so long out of touch with fortune, to one who claimed so much in the name of his work.

Dolly was late for dinner that evening. "I have something to do to my dress," she whispered to her father aside. "Do you mind that it is a little frock of mama's?"

"Why should I mind? Poor child, with no mother's hands to make her fine!" Dunsmuir drew her to him, pressing her head close to his breast. "Dolly, if ever any one should come, asking questions of you—be slow, be slow to answer him! Remember, a woman's no may be changed to yes; but her yes should be forever. They say he gives twice who gives quickly; it is not so with all giving. A man does not prize a woman's readiness."

"Father!" Dolly exclaimed, looking hurt and frightened.

"I'm not saying that you have been—I'm saying nothing; but for God's sake, know your mind. Tell him no, whoever he may be; tell him no, and no, for as long as you can say it!"

DUNSMUIR and Philip sat down to dinner together in silence. At Dolly's empty place there lay a sumptuous bouquet of hothouse roses, with a gentleman's card attached.

"From my father," Philip replied, to the other's questioning look.

"Ay," said Dunsmuir, grimly. "And are those the flowers she is to fling at the feet of the waters to-morrow? I should have given her a bunch of sage and sunflowers, or a handful of wild syringa from the rocks; but your father's gifts always have a trade value. There 'll be as much as ten dollars' worth of roses in that bunch, I dare say?"

"Expense is nothing to us now," said Philip, forcing a smile. "The work is done."

"Yes, the work is done; not as we meant, but as we could, which is the way of most men's working. The work as I planned it remains for some other man to do."

"I was not thinking of the work," said Philip; "the best thing about it to me is that it is finished. And now may I have your leave to speak to Dolly?"

"What is your hurry, man? The child has enough to think of with this silly celebration on her hands. Leave her in peace till the house is empty, and the ditch is full," he added, with his melancholy smile, in which Philip felt the touch of foreboding.

"If my speaking is going to be only another trouble to Dolly, for Heaven's sake, let me speak and have done with it!"

"Speak then; but remember,

"He that bends to himself a joy  
Doth the winged life destroy.

Be sure that what you grasp at is meant for you and for no other, else you will see your bonny rosebud wither in your hand."

Dunsmuir pushed back his chair, and began walking up and down the room excitedly, saying, in his deepest voice: "God knows I have nothing to wish for but my child's happiness, yet I cannot wish you success. You 'll get it, I know that well enough; but why should a man win his wife so easily? It 's not the way with other winnings. And what will her yes be worth—a child who has seen no one but yourself?"

"I will take it and be thankful, if I can get it," Philip murmured. "The old way is good enough for me."

Dolly came in as radiant as Night in a gauzy dress of black that left her white throat bare above the round neck of the corsage. She was too conscious of her first toilet to help smiling, her color mounting high. Philip rose with a beating heart, and placed her chair; but her father looked at her strangely.

"Is that your dress for to-morrow?" he asked.

"It is the one I spoke to you about. It was the only one that fitted me."

"'Black is for mourning'; you cannot wear black for the Marriage of the Ditch."

Dolly was greatly disappointed. A vision of herself, in one of her old home-made frocks, before all that staring crowd at the head-gates, before the town ladies and the magnates from a distance, preoccupied her miserably.

"There 's no gainsaying a woman on a question of her clothes," said Dunsmuir. "Come, eat your dinner, and don't sit there so big-eyed! Look at the grand bouquet the manager sends to the Lady of the Big Ditch."

Dunsmuir ate nothing himself; he was jerky and artificial in his talk. The others made no attempt to talk at all.

"If you want me," said Dunsmuir, rising and looking at Philip, "you will find me at the dam. The lake is filling fast; I shall stay below till bedtime." Philip had risen and stood by his chair, and Dolly leaned forward, watching her father's face; she was startled at its paleness and fixity. "There is a strange fascination in that vesture of stone and mortar, to one who knows its history." He spoke to Philip. "Our tale of bricks is completed: it is time we gat us up out of the land of bondage. Now what 's the word for to-morrow?—let us see." He stopped by the door, in passing out, and tore a leaf from the calendar. In the waning light he stooped and read aloud:

God is not dumb that he should speak no more:  
If I have wanderings in the wilderness,  
And find not Sinai, 't is my soul is poor.

"'And find not Sinai,'" he repeated, smiling at Philip. "Did I not tell you, it is time we gat us up?"

"What does he mean by the 'land of bondage'?" whispered Dolly as the door closed.

"His long waiting, perhaps," Philip answered, though he knew well what Dunsmuir meant.

The breeze from the river parted the light curtains on the tinkling rods; shattered gleams struck here and there about the darkening room. Moments remembered and words spoken between them revived with sudden intensity of meaning. He was free to speak now, but his heart was too full.

"Give me just a moment on the grass by the east windows?" he entreated, as if there were scarce hope of such a boon.

Their very nearness troubled the currents between them, and kept them apart. Outside, the waters were climbing silently behind the dam—faster for the heavy rains that had been falling on the mountains, augmented by the melt-

ing snows. Every inch of that tremendous watershed was casting in its drop; but below the hill, where the bar had been heard to roar on soft spring nights like this, all was ominously quiet. The lake was creeping up and up, leaning its swelling heart against the dam. A faint ripple, a stealthy sound, not to be detected without close listening, alone betrayed the gathering of those mighty incoming forces.

A new moon, as slender as a young girl's finger, beckoned in the west. Philip walked the grass impatiently; a hard excitement tightened his grasp upon his bated bliss.

"My love, my love," he whispered—"of the summer, of the autumn, of the winter; come, come and bless me, for the work is done, and the water, the water, is climbing fast!" All the while he was hideously conscious of the water.

"Shut the gates and let her head up." This was the order which had come from the manager's office. The chief had been in a mood of desperate, savage acquiescence in any madness that might proceed from the office in town; and between the fighting captains the soldier has but his orders.

He stepped across the rose-bed, and called softly at Dolly's window, "Are you never coming?" And in that instant it was too late. There was a shout; he was wanted at the dam.

He glanced at the lake as he ran along the hill. In that last hour it had climbed a foot. It was awful: climbing, shimmering, darkling; and in its depths floated the inverted crescent, his moon of love sinking in the lake.

Dunsmuir was down by the toe of the dam, stooping far out on the edge of the sluggish remnant of water which crawled in the downstream channel. He called Philip, by name, as he had not spoken to him for months. His manner was direct, simple, responsible; he bore himself as a man in the presence of a great danger.

"For God's sake, look at that!"

Water is a very secret, subtle thing; it dissembles its sinister forces in trifling appearances which might amuse a child. The two men were staring at just a toss of bubbles discolored with mud boiling up and spreading fast from the toe of the dam. But these came from a spot just over the fault in the foundation. No more was said, but the order was given to open the scouring-gate. Philip had started up the bank toward the head-works when a second eruption followed, more copious, violent, and muddier than the first.

Dunsmuir called to him: "Stop; I will go. Saddle up, and get word down the line on this side, and send a man across. *Go yourself across*; it will be a close call this side of the notch. You must save Margaret and the old man."

There was no question to each man of his duty—to the young man his orders—to ride

and to save; to the chief his watch by the breaking dam.

As Philip bounded up the hill he was thinking, between heart-beats, not of the work nor of his orders, nor even of that deathless call that now and then singles a modest youth from the ranks, and spends him, in one wild moment, for a deed that but for some one's blundering had not needed to be done; he was arguing the point with himself quite simply and with great clearness: he could not go without one kiss from Dolly. There would not be time to ask her or to tell her why. If the dam should break before he gained the notch, she would know then why he kissed her; if he made it alive, there would be time enough to explain.

Dunsmuir had not been able to relieve the pressure on the dam. Within its foundations disorganization had progressed so rapidly that all its functions had ceased. Dissolution, he knew, must be near. He had timed Philip from his start. He had lost a moment above, warning Dolly not to go off the hill (no; Philip had not counted that moment lost); he had lost other moments raising the camps; he had lost time at the ford. He had half a mile to the notch, and two to the ranch where the old man and his wife were sleeping, unconscious of all this wild work going on above.

There was one spot where the wagon-road on the other side crossed a low ledge projecting from the foot of the last bluff, which, with its opposite neighbor, formed the notch of the cañon. When sunset fell clear, and the color lingered, a horseman crossing that step could be seen from the dam, a speck against the low light in the west. Dunsmuir walked out to the middle; the scouring-gate was nearer the head-works. He stood just over the spot where the trouble was advancing, and stared into the distance. It was too dark; he could no longer make out the ledge. He looked at the shoulder of the bluff through which the Big Cut was to have conducted the water. Against that first obstruction the wave, when it leaped, would break, and, reeling backward, overwhelm the low shore opposite. A thousand times he had watched the shock, the dizzy recoil, the thundering outward swirl of the spring floods, now magnified and uplifted to a deluge. And all that peaceful shore, with the white road hugging the bluffs, would be "turned as wax to the fire," as "clay to the seal," when the waters uprose and stamped it out of sight.

There came a third eruption, with a fearful crunching sound of smothered upheaval. Enveloped in an enormous mass of muddy water, the piles and timbers that had plugged the foundations of the dam were forced upward; the wall of the scouring-gallery sank, and the gate fell in.

"Lord, spare the green and take the ripe!" Dunsmuir called aloud, from his watch on the dam. He stood about the middle when the heart of it burst, and the lake went out in one vast arc of solid water. The better part of the work remained as a bridge, spanning the awful rupture. On that bridge he was seen one instant and then he was gone. Even as the swollen waters rent their imperfect vesture of stone and mortar, so his soul cast off its mortal lendings: the man and his work were one.

In twenty minutes from the bursting of the dam the lake was empty. And as the swollen river thrashed and sobbed and rocked itself to rest in its old channel again, that small, cold laugh was heard, distinctly syllabled, in the echo of the mournful wave that broke beneath the ruined dam.

## XXI.

DOLLY walked the empty house from room to room, under festal doorways hung with flags and silly emblems, between mantels banked with flowers, breathing the sickly scent of wilted wild syringa, crowded into pots in the cold, drafty fireplaces. It was a chill spring morning, but no one had thought to build a fire. The house had a haggard, bedizened look—a stare of homeless expectancy. In the kitchen Jenny was setting forth breakfast for the men, hastily chosen from the heaped dainties that now were funeral baked-meats. The tents and all the camp outfit were strewn for miles down the valley.

Word had come from below that Philip had signaled his safety, but could not cross, as all the boats were loose, and the ford was roaring. But toward evening he came, bringing Margaret with him; and Job's wife was a widow. They had snatched the old man in his blankets and carried him, half insensible, to the mesa, when the wave went down. He had not survived the shock and the exposure, but passed away in the night, Margaret watching by him alone, while Philip went on down the submerged valley, carrying assistance to the fleeing settlers.

No lives were lost but those two most closely bound up in the history of the work: but in the track of the wave, fields were buried and houses were gutted or swept away; and a heavy tale of damages piled up against the company, besides the immediate claims on private benevolence.

It was not likely that Dunsmuir's dam would ever be forgotten. Dolly's pride was as low as the dam; but her sympathies had spread like the waters. She was sister to all who owed to them their losses. Never was she to speak of the work again without remembering that it had failed; never to boast the benefits of her father's great scheme without recalling the wave of destruction that went before. And the

promise that was given in that hour of grief and humiliation Philip might safely trust, and with his contrite joy began the work of reparation.

HARDLY had the cañon household torn down its garlands and buried its dead, when Norrisson's telegrams were signaling, east, west, and south, for men and materials for the rebuilding of the dam. And Philip's orders were to receive the stuff, and straightway to reorganize the work. When the new chief (made so by his father's command, with no words wasted) went to the manager to talk over the plan for the foundation, Norrisson replied:

"Excavate! Get down to that rock if you sink to hell. *This is Dunsmuir's dam.*" And never did Philip hear another word of acknowledgment from his father's lips. Norrisson's way was not the way of talk.

"But the high water," Philip objected.

"Turn the river over the waste-weir."

"But, great heaven, the cost!"

"I'll take care of the cost. If the Englishmen are going to lie down, let them be quick about it; I can take my bonds elsewhere. I walked the floor on that first scheme, now it's their turn. If they want this thing, they'll have to pay first and talk afterward."

In that crisis Philip came to know his father. The man was simply a force, devoid of memory, of conscience, or of ruth. He was nothing hampered by the past nor daunted by the future. He saw only the hole in the dam, which he swore should be stopped before the crops withered.

"You keep your hand on the throttle, and I'll shove in the coal," he said. And Philip guided, and his father fed the fires of the work. Men, teams, powder, a costly electric plant, timber, stone, mortar, and cement, were hurled into the cañon, as fuel for those fires that burned by day and by night, without one hour's cessation, till the hole in the dam was stopped—and the crops were not yet withered. And Norrisson's exultation passed all bounds: it was the measure of his previous unspoken chagrin.

"Perhaps you thought you were working up here before," he bragged to Dunsmuir's ex-assistant. "Now you know what I mean by work. I should have let Dunsmuir go ahead with his own plan in the first place, if I could have driven the work; but he would n't let me drive, and he would n't drive himself. If he had been in charge here now, he'd have refused to do anything till the river went down; and then our stock would have been as low as the river. No, sir; an Englishman does n't know the meaning of the word time."

Having done the work, and satisfied his pride, and boasted like the son of Tydeus, he proceeded to do honor to the vanquished dead. Out of his own pocket, as though the expense

were naught (how that pocket was filled has been hinted, but the thing could not be sworn to), he superadded to the parapet of the dam a tier of open arches on each side of the roadway from the head-works, or "poise," to the waste-weir. At the spot where Dunsmuir handed in his resignation one arch was raised above the others and converted into a niche, wherein was placed a bronze mural tablet, with a sculptured seat beneath. He did not meddle here with the design, nor did he build in haste, for he was not "placing" this work; it was his present to posterity, conceived in a spirit of reparation as extravagant as his pride.

While this demonstration was going forward in honor of her father, Dolly offered not a word. Philip understood well her silence; he felt, with her, the insolence of his father's complacent tribute to the man he had first broken and then bought. He also understood that she endured for the sake of the living what she would have rejected for the dead. Neither could he protest, and this strange offering of mixed motives added its significance to the story of the ditch.

"Fifty years from now it will not matter," Philip comforted himself. Yes; in less than fifty years, in less than five. The great dam with its crown of sculptured arches stood there as solid as the hills, the lake above, the spreading waters below, telling its own story. No one supplied the merciful omission or enforced the lesson. Jacob who tempted, Esau who sold, for that he was weary and faint with fasting long afiel—the children of those very human fathers were human also; they loved, and humble love forgave what proud principle condemned. As for their world, it was busy gathering the new wealth which the waters had sown; it had no time to think who built the ditch or how. There was the water.

On a fair spring evening, when the lake holds the glory of the sky reflected in its depths, an old woman may sometimes be seen seated sidewise in the niche, supporting on her ample knee a young child who is just beginning to stand alone. He has bright hair and wonder-

ful hazel-gray eyes. With his finger he follows the raised letters of the inscription; and the pair might well have been in the sculptor's mind when he designed the niche: Margaret, keeper of the past, and Philip's child, coheir and co-worker in the future.

And the words the boy will one day read are these:

TO THE MEMORY OF  
ROBERT DUNSMUIR, M. INST. C. E.,  
WHO DESIGNED  
THESE WORKS FOR IRRIGATION,  
1874-1891.

I will even make a way in the wilderness, and rivers in the desert.

Ye shall not see wind, neither shall ye see rain; yet that valley shall be filled with water.

But Margaret takes no cognizance of these haughty promises. The text from which she reads the story of the ditch, the one she will rather teach the boy to read it by, is this:

So then neither is he that planteth anything, neither he that watereth; but God that giveth the increase.

The ideal scheme is ever beckoning from the West; but the scheme with an ideal record is yet to find—the scheme that shall breed no murmurers, and see no recreants; that shall avoid envy, hatred, malice, and all uncharitableness; that shall fulfil its promises, and pay its debts, and remember its friends, and keep itself unspotted from the world. Over the graves of the dead, and over the hearts of the living, presses the cruel expansion of our country's material progress: the prophets are confounded, the promise withdrawn, the people imagine a vain thing. Men shall go down, the deed arrives; not unimpeachable, as the first proud word went forth, but mishandled, shorn, and stained with obloquy, and dragged through crushing strains. And those that are with it in its latter days are not those who set out in the beginning. And victory, if it come, shall border hard upon defeat.

Mary Hallock Foote.

"AND THE SPREADING WATERS BELOW."

ENGRAVED BY C. A. POWELL.

WITH PICTURES BY HARRY FENN.

WHEN one studies the vegetation of the western coast of the continent, it is found to be undergoing many and surprising changes. Native plants have been destroyed in

some districts in order that exotic plants of commercial value might take their places. Exotic plants have escaped from cultivation, and are familiar denizens of roadsides and ravines. The soil and climate of California are so friendly to plant life that only a botanist can give a list of the species already naturalized, or another list of the species from all parts of the world that might easily become wild here if they had the chance.

Out of all this arises a curiously complex and interesting result—as if a thousand grafts of modern garden art were already set in native stocks to produce in due season more varied and wonderful results. In other States the exotic elements remain exotic, mere pot-growers in conservatories; here they have equal rights to the soil. Giant redwoods and oaks belong to the earlier wilderness, and to the California of the pioneers; but the orchards of olive and orange are the creation of an age of intensive horticulture. The border-land between realm of orchard and realm of wild forest is full of undeveloped possibilities, new forms of landscape gardening, new harmonies of plants with

architecture. One of the first planters in the Santa Clara region was wont to say, "I have given up trying to find what I can grow on my land, but I should like to know if there is anything that I cannot grow." There are, however, an infinite number of differences in the same valley, or even on the same farm, and the key to the fascinating contradictions of California plant life is to be found only in the native flora.

California astonished the botanical world long before it began to play much of a part in politics or business. Neé, the botanist, was at San Diego and Monterey a hundred years ago, and his collections are still to be seen at Madrid. Dr. Menzies, whose portfolios are partly at Kew, partly at the British Museum, spent several seasons on the coast a few years after Neé. David Douglas, one of the most devoted and successful of botanical explorers, reached the Pacific coast in 1825. Nuttall sent his herbarium to Harvard University. Pickering, Hartweg, Coulter, and others were early in the field. None of them were more typical investigators than the late Dr. C. C. Parry, who first crossed the country with the Mexican Boundary Commission. At intervals, for forty years after, he was a familiar figure to hunters, prospectors, mountaineers, and all sorts of outdoor people from the Arizona deserts to the Siskiyou pine forests.

So early were collectors in the region, and so universal was the interest felt in Europe

over the new plants of the Pacific coast, that many trees of sequoias and other superb conifers were planted in the parks of England, France, and Italy long before the discovery of gold. Wealthy Californians, as early as 1855, visiting Europe, were surprised to find how popular were the brilliant annuals, flowering shrubs, vines, and trees of their own State. Returning, they often urged neighbors to cultivate more of the native plants, but with little effect. In Alameda County, a plain, uneducated Englishwoman of Lancashire yeoman stock was one of the first persons in all California to make a home garden of wild flowers from field and hill. I remember in my boyhood the passionate devotion that she showed to this pursuit.

"It do be the best land the sun ever shone on," she declared, "for poor folk to have a garden."

The first botanists recognized many and strange contradictions in California plant life; more complete knowledge has only emphasized this feature. Very glorious are the superb flowering shrubs of the desert plateaus, such as *Fouquieria*, the *Fremontia*, and numerous acacias. Around the old missions, naturalized long ago, is the fragrant Farnese acacia of southern Europe. Agaves, cacti, palms, and yuccas grow in the Mojave and Colorado deserts, and species of conifers allied to Mexican species hang to the barren mountains. The Coast Range, the Sierras, and the great interior valley of the State present widely different botanical features from those of the extreme south or of the desert district. Little of the Rocky Mountain influence, or of that of the Puget Sound and Oregon region, is manifest in the California flora, and it is connected only remotely with the flora of the Mississippi valley or the Atlantic slope. Species of the *Portulaca* family are very numerous on the Pacific coast, and the *Compositæ* really seem to make the bulk of the field and hillside flowers at all seasons of the year. Next to the *Compositæ* must rank the lilies in their innumerable subdivisions. Lupines and clovers are also well represented. On the other hand, very few asters, goldenrods, lobelias, milkweeds, or gentians are found in California. It would be easy to give lists of plants whose nearest relatives are Asiatic, Mexican, or South American, and of others hardly represented outside of California; but the purpose of this paper is less technical, and more universal. It deals with those features that are most striking, and most characteristic of the region.

Chief among the native species are the conifers, and the sequoias are easily first in the class. That most painstaking investigator, Dr. Asa Gray, who gave evidence over and over again that the Pacific coast vegetation possessed for him a perennial charm, tells us in one

ENGRAVED BY S. G. PUTNAM.

A MIDDLE-AGED REDWOOD TREE, CAZADERO, CAL.

of his graphic papers how the two sequoias, sole living representatives of fossil species that once grew within the arctic circle, were pushed south along Coast Range and Sierras, were cut off from retreat, and therefore perished everywhere except where soil and climate fostered them. Hence the isolated forests of the giants

that the redwoods of these three localities are in reality three different species.

I remember a typical outpost group of redwoods on the trail from Cazadero to Guerneville. Seven or eight trees stand on one side of the road and nine on the other; their curving branches, interlocking, form an immense arbor

MADROÑA TREE, COAST RANGE.

ENGRAVED BY R. C. COLLINS.

of a prehistoric age, scattered as sequoia islands in the midst of hundreds of square miles of pines, cedars, and spruces.

In the minds of many lovers of forests the true redwood sequoia of the coast is a finer tree than the famous "big tree," the sequoia of the Sierra. It is almost as large as the latter, and far more graceful in stem and foliage, while its habits of growth are unique among the conifers of the world.

The redwood can be studied to advantage in three places: along the banks of mountain rivers, such as the Gualala, where it grows to an enormous size, occupying the entire valley almost to the total exclusion of other trees; in high cañons near the ocean, where the whole expanse of the redwood forest can be seen rising in slopes and terraces to the clouds; and lastly, on the rounded summits of the mountains, where the sea-fog ceases, and the outposts of the redwood forest press into the land of the oaks and the laurels. One can easily believe

of a thousand feet in circumference, and more than two hundred feet to the apex. They grow on the end of a long promontory thrust out from the golden slopes of the higher ridges to the eastward, where hosts of deciduous oaks are scattered as wisely as if planted by some landscape-gardener; the promontory drops downward in long, easy slopes, ever more and more thickly clad with yellow pine, Douglas spruce, libocedrus, and scattered redwoods, till it descends to the dark cañon's depths, black with unbroken redwood forests. Golden grass and scattered oaks shine in open vistas part way down the slope, and serve to isolate the solitary group of redwoods by a mile or two from their fellows. Young redwood-trees, sprouting from the roots, make a dense and spicy thicket about them, and half conceal the great shafts that uphold in the wilderness this shelter that an army might camp underneath.

The place is fifteen hundred feet above the sea, and, as one looks eastward, the physical

conditions under which the redwood forest exists are clearly revealed; narrow cañons run seaward and meet others, until great winding mountain basins are formed, and in these are the centers of the lumbering industry. Islands of mountain rise out of the forest, the largest of them nearly two thousand feet high, but the general level of the oak ridges that cross and divide the "land of the redwood" into groups of forests is hardly twelve hundred feet. Dark green, misty with the smoke of fires, is the prevailing color of the dense redwoods, but the whole expanse of broken country is spotted with broad seas of old gold—they are hilltops and slopes of ripe grass, although it is hardly midsummer. Here are the scattered pastures of the Coast Range; they descend far down into the redwoods, but near the edges of the oaks they cluster and increase toward the eastern horizon until they grow to be the broadest and most luminous slopes of color

redwood in perfection. In such places there are often rings of great trees inclosing pits five or six feet deep, and thirty, forty, or even fifty feet in diameter. Each of these pits is supposed to show where the venerable ancestor of the surrounding circle of trees once stood. Long before it fell, innumerable sprouts grew from the yet living roots. Afterward, when the giant yielded, the rains washed new soil into the "bottoms" from the mountain-sides, to fill the deep chasm. For a century or so there was a struggle among the children of the fallen monarch, and at last only seven or eight remained, to become great trees of twelve feet in diameter set on the rim of the pit formed by the decay of the roots of the ancient tree, and each having a complete root system of its own. Other trees, seedlings or sprouts, grow up between them, and in a few more centuries the process of forming another redwood-tree ring will be repeated about the largest of the second

FIG-TREE, RANCHO CHICO. (GENERAL JOHN BIDWELL'S.)

imaginable, rising about the shoulders of the greater mountains, and descending in long expanses far inland to such warm valleys as Santa Rosa and Sonoma. Even there, forty miles from the forests, a solitary redwood sometimes appears, the notable tree of a whole township.

On the camping-grounds of the Bohemian Club on Austin Creek, and in the Armstrong tract near Guerneville, one finds the lowland

growth. Rings of this sort can be found in all stages of formation in every cañon and valley of the redwood country. Some very large rings still show the broken edges of the central tree's roots projecting like the staves of a barrel around the hollow, overgrown with ferns and wild oxalis, or filled to the brim with fresh, spicy redwood sprouts. The green spires of the living forest, three hundred feet high, filter the air through

MANZANITA.

their innumerable branches, and shut out all but faint blue sparkles of the sky. The dust of one of the pioneers is underfoot, and a little tree of last year's growth is struggling to gain a place. The red-bronze trunks of the trees stand like a wall, hiding the rise of the mountains, hiding the banks of the river, though one hears the sound of its flow, and the splash of little trout streams in the cañons. Such groves as this are the temples of the California forest system.

In the Coast Range, belonging somewhat to the redwood belt, and somewhat to the oak openings, but not wholly to either, is a tree that is dear to the heart of poet, artist, and nature-lover. It is an arbutus, by family rights, but it is a glorified arbutus that rivals the *Magnolia grandiflora*, or any other tree of the continent. Many a writer and many a famous botanist have tried to make those who have never seen a madroño understand its grace and color, but it remains the despair of sylvan description. The madroño fully compensates California for the absence of the lovely white-birch stems, and of the scarlet sumac in autumn. Its flowers are insignificant, but its berries outshine the holly, and are infinitely more striking, while the glory of its bright green leaves is a constant joy. The young madroños grow in thickets like young mountain maples, and have long, straight, shining stems, no two alike in color, but ranging in the same thicket from light green almost to yellow, and from yellow to brownish red and rose-tinted purple. Nothing else that I have ever seen in the forest is quite so fresh, so clean, and so richly tinted as a madroño thicket.

The large evergreen leaves sometimes grow in whorls, almost like a Norfolk Island pine, and the light is reflected in so many ways from the smooth stems that an artist would find as many flesh-tints as in a garden of girls; each separate stem is worth study. The bark is smooth, with a soft texture finer than a kid glove, and glowing as if it held a different sort of life from that of the young oaks that stand a little apart. Unless there is a hamadryad in the

madroño, none are left in earthly forests.

Apart from the thickets, comparatively few single madroños are seen. In fact, some districts contain only dwarfed and shrub-like madroños, but in other places there are great trees from eighty to one hundred feet high that more than fulfil the shy promise of the slender shining stems of the madroño thickets. There are not many such trees, and no photograph can serve to illustrate their magnificence. One in Sonoma County stands on a cliff,—an old tree, deeply scarred by fire. It is as picturesque as an olive or a cypress, with the added expression of color so varied and comprehensive that artists come from the valley below and make studies of it against the blue sky or the dark cliff. The old bark is rough, with very striking red-brown knots and bosses like dark armor, among which are perfectly smooth golden or olive-green or almost scarlet patches of shining, exquisite color. Every month of the year one who studies such a tree will discover changes; every madroño in the mountains has its especial and separate tints of color, its own peculiar charm of manner, its noteworthy combination of the more mature bark with the fresh, changeable, and transparent covering that is like the skin of a child. The very oldest madroño in California is grizzled only about the trunk; even the large branches keep the young look, and each little twig is as fresh as if it belonged to a madroño thicket. For a space below the beautiful crowns of leaves, as large and nearly as dark as the leaves of *Magnolia grandiflora*, the new wood is light, clear-hued green, yellowing downward. Then comes that rich, firm scarlet, so

brilliant that one could easily believe the saying of an old Sonoma pioneer, that when he was out late on the mountain he "had to see his way by the mathrone stems; they kep' the light an hour longer than anything else." As the new bark grows on the madroño, flakes of the old fall to the ground and lie there in crisp, dainty piles of brightness.

Another of the beautiful heaths, to which the arbutus, the leucothoës, the rhododendron, and many other striking shrubs and trees belong, is the manzanita. One species, the *uva-ursi*, or bearberry, extends around the world, but nearly all are Californian, nine or ten species being peculiar to this State. They are shrubs or small trees, with smooth bark ranging in color from that of the madroño to a rich and dark-red purple. The thick oval leaves and the clusters of fragrant white or rose-colored urn-shaped flowers add to the attractiveness of the manzanita. Its crooked stems are beginning to be known in the cane-shops, and the knots and roots have many ornamental uses. Thousands of acres of manzanita thicket have been cleared to plant vineyard and orchard; the dainty little tree seems to occupy some of

makes a wonderful display. From December to April, according to the locality and the season, one can find bushes on the hillside raining down an inch-thick carpet of blossoms, day after day, and still clothed in fragrance and beauty so charming that even the old residents of the manzanita region speak of the time of its blossoming as the prime of the California spring. The stages of the mining counties stop for passengers to break off branches, and groups of campers use the manzanita when in bloom for the decoration of tents and tables. The gorgeous flame-hued *eschscholtzia* has been chosen for the State flower, for it belongs everywhere, and illuminates valley and hillside alike, but nothing among the distinctive plants of California takes precedence of the dainty manzanita. More brilliant in their seasons of bloom are the two rhododendrons that make huge masses of color beside mountain springs, and the lilac-like thickets of *ceanothus* in the shady redwoods; but none of these have the delicate hue and the rare fragrance that make the manzanita unique among shrubs.

In all the mountain cañons are broad-leaved maples, which grow in copses that are worthy

HABITS OF TREES OF THE COAST RANGE.

the choicest fruit-lands of California. It is as wild and shy as a quail, and the gardeners find that it will not bear removal to the lowlands. The other shrubs of the region can be transplanted, grown from seeds or from cuttings, but every effort to make the manzanita a denizen of the gardens has come to grief, even in the mountains. At the season of bloom it

of a painter's pencil. The same species of maple is found in the valleys, but there it is large and stately, with dark-brown trunks and rounded tops; in the foot-hills it has the most lovely bark of white and gray, rivaling in grace and softness of outline the white birch of New England. One is tempted to name it the California birch-maple, so striking is the effect of

ENGRAVED BY GEORGE P. BARTLE,

EUCALYPTUS.

the shining stems of a hundred or more maples growing at the head of a gulch between pines and madroños. The buck-eye has something of the same gray-and-white mottling, and so have several of the oaks. There is a little tree, something like a cottonwood, that grows in the Sierras, which has a soft and shining bark of creamy white, flecked with brown spots. This tree, hardly less than the maple of the Coast Range cañons, reminds one of the white birch.

One hardly knows where to begin with an account of the numerous California oaks that form the most distinctive feature of the valleys of the State. As far as appearance goes, there are no finer oaks in the world, but their timber, except that of a few species, is not yet considered of much economic value. Professor Edward L. Greene of the University of California, in his monograph on the subject, illustrates about twenty-five distinct species of "West American Oaks," and describes several varieties of lesser importance. There are not only white oaks, and some of the finest species known among all the three hundred oaks of the world, but also black oaks, both deciduous and evergreen, and a species of oak that is almost as much of a chestnut as it is an oak. One thing seems to the botanist worth mention, and that is the curious fact that typical trees of the California oaks are very much more like the oaks of Europe than like the

oaks of the Atlantic slope. In growth and general appearance the oak groves of England are closely reproduced in California. Experience shows that the European species of oak grows easily and rapidly in California, while the common oaks of the Atlantic slope grow but poorly. One or two species of western "water-oaks" seem to suit the Pacific coast, but even these do not thrive as well as the English oak.

When American pioneers came into unfenced California, oak forests almost filled the valleys. The trees were not crowded; they seemed planted in vast park-like landscapes for miles. Up the Coast Range one could literally ride

from San Diego to the edge of the redwood country without ever being a mile from groups of gigantic oaks. In the same way, the whole valley edge along the base of the Sierras, from Fort Tejon to Fort Reading, was thick-sown; the Upper Sacramento was especially a land of oaks, which it still remains. Not only "Paso Robles," but every pass in the foot-hills from one watershed to another, was truly a "pass of the oaks." Most of the famous fords that the gold-seekers knew over the Calaveras, the Tuolumne, the Consumnes, the Yuba, the Feather, and hundreds of other rivers, were in the midst of giant oaks. Every county and district has some tree of local fame, and the time may come when the history of the individual oaks of California will be of much interest. The most prominent white oak of the valleys is *Quercus lobata*, a tree that often grows a hundred feet high. This species, and the leading evergreen species of the coast, the *agrifolia*, were discovered by Neé, the botanist. General Frémont, who camped on the Stanislaus River in 1846, makes special mention of the superb white oak. Professor Newberry, writing in 1853 of the Cache Creek country, says:

This timber-belt is composed of the most magnificent oaks I have ever seen. They are not crowded as in our [Atlantic State] forests, but grow scattered about singly or in groups, with open, grass-covered glades between them. The trunks, often seven feet in diameter, soon divide into branches which spread over an area of which the diameter is considerably greater than the height of the tree. There is no undergrowth beneath them, and as far as the eye can reach when standing among them, an unending series of great trunks is seen rising from the lawn-like surface.

A striking feature of the summits of the mountain ridges is the manner in which clumps of oaks occupy great hill-forts. Our highland oaks love to grow on isolated masses of rock, either alone or with pines and laurels. Some of the most characteristic trees of the species can be found crowning such rock fortresses on the points of otherwise naked promontories. One easily reaches

them over long, open slopes of wild oats, thick-sown with larkspurs and eschscholtzias; beyond them the mountain drops suddenly to the level of valley and river. A remarkable habit of the live-oaks (*Quercus agrifolia*) is to marshal themselves in military lines and groups along the smaller ravines that lead upward from the large cañons, and so to serve, in some measure, as sentinels that distinguish the watersheds and slopes of the range. The knolls and hilltops between seem nearly treeless, except for a few scattered pines. The rounded heads of oak after oak, in long curving lines, occasionally massed on the brow of a hill, where they stand against the sky, form one of the most noteworthy features of the landscape over a large portion of California.

One of the finest single oaks known is the Sir Joseph Hooker tree on General Bidwell's Rancho Chico in northern California. When that distinguished botanist visited the region in company with Dr. Asa Gray, he declared that this tree "was in all probability as large and perfect an oak as any in existence." This oak and several others of well-deserved fame, a few notable redwoods, one or two madroños, the famous cypresses of Monterey, and some noble pines of different species, should be set apart and protected as completely as the Sierra sequoias. Two or three well-chosen reservations of a thousand acres apiece—one in Shasta or Siskiyou, another in Mendocino, and a third in Santa Cruz—would preserve fine specimens of nearly all of the native shrubs and trees of California, and also several of the best oak forests that are left unspoiled.

CYPRESS POINT, MONTEREY.

The great tree-like yucca of the Mojave, growing on a dry and barren waste, deserves to be numbered among the fantastic plants of California. It is rarely seen in any garden, for it is of

ALMONDS AND RAISIN GRAPES, RANCHO CHICO. (GENERAL JOHN BIDWELL'S.)

slow growth, and there are many finer blooming species; but none of the desert plants suit their environment better. Some of these days, when only a few are left, those few will be as famous as the dragon-trees of the Canaries.

So much for a few of the picturesque species of native plants of California. But, as outlined in the opening paragraphs of this article, the horticulturist has a claim upon this subject. The fruits and flowers that he plants vary more rapidly here than elsewhere; so he produces new and valuable varieties. California has become the paradise of the rosarian, the seed-grower, the hybridizer, and the nurseryman. The wild grape is used as a stock for wine and raisin grapes, and, in some cases that I know of, men have grafted Italian chestnuts upon one species of the native oaks. All the hillsides of the tree region, when not too steep to plow, nor too far above the sea-level, will grow the fruits and varied horticultural products of Spain, Portugal, Italy, and southern France. The pomegranate is a garden shrub in many districts, and the almond is a roadside tree. The drooping, acacia-like leaves of the scarlet-

fruited pepper-tree grow with magnolias, palms, and cedars of Lebanon. Oranges and lemons stand in many an orchard with apples and peaches. Among the notable plants of the State are many adopted species, such as the acacias and *eucalyptuses* of Australia, and the bamboos and persimmons of Japan.

When Americans came to California, they were surprised at the variations that they observed in familiar plants. The elderberry, which is only slightly different from the elderberry-bush of the Atlantic slope, often becomes a tree of from two to four feet in diameter and thirty or forty feet high. This is merely a matter of local environment, rich soil, and shelter; the same species is a mere shrub on the rocky hillsides of the Coast Range. The bronze-leaved *Ricinus*, which makes a semi-tropic summer garden in front of many an Atlantic coast cottage, grows for year after year in California, until a section of its stem a foot and a half in diameter can be obtained by any collector of vegetable curiosities. Geraniums, nasturtiums, tomatoes, and many other plants, useful and otherwise, escape from cultivation, modify their habits of growth, and soon become

wild again. Many plants of Mexico, Peru, Chile, the Hawaiian Islands, Australia, New Zealand, South Africa, and the Mediterranean shores have already become dangerous weeds. The loquat, a choice fruit of Japan, is already growing wild in some cañons where picnic-parties have left the seeds. Apricots, peaches, cherries, and English walnuts have been found in the forests—chance seedlings, growing with the madroños and manzanitas.

The horticulturist, no less than the botanist, has his notable trees to admire. Old olive avenues that the mission fathers planted still remain, and some of their seedling pears are like forest-trees for size. The fig becomes a most striking tree when of sufficient age, not only for avenues, but as great tree-arbors. In some cases, in rich and warm soils, its drooping branches root and grow out still further, until it is like a banian for its multitude of stems, and the ground is covered in the season with its ripe fruit. I remember fig-trees in Vaca Valley, in the midst of evergreen oaks, that really seem to be quite as large as the oaks themselves. The walnut groves of Santa Barbara produce the same massive and stately effect when in leaf; they quite dwarf the ordinary orchards by comparison. A great many of the fruit districts of the State will ultimately possess a sort of dignity that seldom belongs to mere

orchards as known in other parts of the world. All the trees will become very large, and will remain in health for a long time. Some of the Riverside oranges are already magnificent trees, and are growing still larger. Pecans, walnuts, Italian chestnuts, the carob of Asia Minor, the pistachio, the olive, and a countless variety of nut- and fruit-trees of especial beauty and character, are being planted everywhere. Then, too, the habit of massing separate fruits—here twenty acres of cherries, there thirty of peach or prune, and between them, perhaps, a vineyard or an olivarium—will always give orchard districts a peculiar charm. When the almond

ARTESIAN WELL IN THE DESERT.

ENGRAVED BY H. E. SYLVESTER.

is in bloom, one country-side is full of the drifted snow of almond flowers; the next week another little district, only a few miles away, begins to flush pink with peach-blossoms. The whole tendency of California horticulture seems to be toward specialization, and thus the orchards even now possess much of the attractiveness of natural forests. As they grow old and are partly replanted, as the roadside trees become mature, and as new orchards extend into the wilder parts of the State, all men will recognize the fact that California, once a great mining commonwealth, has become a distinctively horticultural community, whose most characteristic feature is the enormous range of plant growth, wild and cultivated.

Every year the broader comparison between the two sides of the continent reveals increasing contrasts. The Californian who visits the

forests, so unlike the pineries of other States. He misses the careless ease of growth, the fullness and variety of exotic plant life. He misses much in color as well as in form. Even the buttercup season of New England, or the time when goldenrod is in its prime, seems cold and fragmentary to the Californian, who is used to the sunlit hill-slopes, where wild poppies and a thousand sorts of liliaceous and composite flowers grow in brilliant hosts under the cloudless skies, and still bloom on and on, while the wild oats, clover, and grasses ripen to golden browns and soft shades of yellow. It is true that New England at its best season appears to the Californian to be unspeakably beautiful, because it is so green, so fresh, so full of small hills and gentle woodlands sloping down to quiet streams: but all the while he thinks of California at the time when the rains are past,

PEPPER.

Atlantic States is impressed with the palmettos of the South, the chestnuts and elms of the North; nothing like them grows in his own forests. But he misses his madroños and manzanitas, his fragrant chaparral thickets, his tree-like yuccas, and his unequaled coniferous

and it is like Palestine, a mountain land, the home of the shepherd and the vine-dresser; he thinks of the season when valleys, foot-hills, and high ranges begin to glow like Italy under the ardent sunlight. For more than half the year, over an extent of country larger than

YUCCA.

New England, one can sleep on the ground without a tent, so warm and rainless a land it is. Still the trees grow, the flowers bloom, the singing birds come out of the cañons and dwell in the fruit-laden orchards, the whole realm ripens as a swarthy olive or a bronze-red pomegranate. And, strange to say, the grape, fig, loquat, guava, and all the other exotics that came in so many diverse ways to California, the weeds that perplex the farmer, the fiber-plants, the insect-powder bushes from Dalmatia, and a thousand other strangers, seem as much at home as the sequoias, and each in its way has helped to create the memories

that the Californian carries abroad with him. Against a background of snow-peaks he sees the pine forests; the valleys and hillsides of the foreground are filled with gardens and orchards, for whose increasing plant wealth the resources of the whole world are being drawn upon. Old mining ditches are changing to irrigation canals; old pastoral counties grow famous for wines, raisins, dried fruits, and a multitude of plant products. Each district, from the extreme north of the State to the extreme south, has its own peculiar advantages, and California deserves to be characterized as the land of varied horticulture.

## PAVEMENT PICTURES.

**W**ILD storm, this languid summer night,  
Clashed o'er the city an hour ago;  
But now, released in heaven's blue height,  
A moon has brought her sorrowing glow,  
To flood the massed roofs' dimness dense  
With pale celestial penitence.

The breeze wakes rich in soothing damps;  
Faint spires loom silvered; and one sees  
In street or square, by rain-splashed lamps,  
The wet leaves flickering on stray trees;  
While black fantastic shapes of dream  
Bold from the drying pavements gleam.

Chance moods of moisture's random change,  
The dumb stone flaunts their blots grotesque,  
Where freaks of spectral traceries range  
Through many an elfin arabesque —  
Till the huge town's vice, crime, despair,  
Seems devilishly pictured there!

*Edgar Fawcett.*

## A MOUNTAIN EUROPA.

IN TWO PARTS.—PART II.

PICTURES BY E. W. KEMBLE.

DAD. ENGRAVED BY CHARLES STATE.

VII.

IN the following Sunday morning, when Clayton walked up to the cabin, Easter and her mother were seated in the porch. He called to them cheerily as he climbed over the fence, but only the mother answered. Easter arose as he approached, and, without speaking, went within doors. He thought she must be ill, so thin and drawn was her face, but her mother said carelessly:

"Oh, hit 's only one o' Easter's spells. She hev been sort o' puny 'n' triflin' o' late, but I reckon she 'll be all right ag'in in a day or two."

As the girl did not appear again, Clayton concluded that she was lying down, and went

away without seeing her. Her manner had seemed a little odd, but, attributing that to illness, he thought nothing further about it. To his surprise, the incident was repeated, and thereafter, to his wonder, the girl seemed to avoid him. Their intimacy was broken sharply off. When Clayton was at the cabin, either she did not appear or else kept herself busied with household duties. Their studies ceased abruptly. Easter had thrown her books into a corner, her mother said, and did nothing but mope all day, and though she insisted that it was only one of the girl's "spells," it was plain that something was wrong. Easter's face remained thin and drawn, and acquired gradually a hard, dogged, almost sullen look. She spoke to Clayton rarely, and then only in monosyllables. She never looked him in the face, and if his gaze rested intently on her, as she sat with eyes downcast and hands folded, she seemed to know it at once. Her face would color faintly, her hands fold and unfold nervously, and sometimes she would rise and go within. He had no opportunity of speaking with her alone. She seemed to guard against that, and, indeed, Raines's presence almost prevented it, for the mountaineer was there always, and always now the last to leave. He sat usually in the shadow of the vine, and though his face was unseen, Clayton could feel his eyes fixed upon him with an intensity that sometimes made him nervous. The mountaineer had evidently begun to misinterpret his visits to the cabin. Clayton was regarded as a rival. In what other light, indeed, could he appear to Raines? Friendly calls between young people of opposite sex were rare in the mountains. When a young man visited a young woman, his intentions were supposed to be serious. Raines was plainly jealous.

But Easter? What was the reason for her strange behavior? Could she, too, have misconstrued his intentions as Raines had? It was impossible. But even if she had, his manner had in no wise changed. Some one else had aroused her suspicions, and if any one, it must have been Raines. It was not the mother, he felt sure.

For some time Clayton's mother and sister had been urging him to make a visit home. He had asked leave of absence, but it was a busy time, and he had delayed indefinitely. In

a fortnight, however, the stress of work would be over, and then he meant to leave. During that fortnight he was strangely troubled. He did not leave the camp, but his mind was busied with thoughts of Easter—nothing but Easter.

Time and again he had reviewed their acquaintance minutely from the beginning, but he could find no cause for her strange behavior. When the work was done, he found himself still lingering, and climbing the mountain once more. He meant to solve the mystery if possible. He would tell Easter that he was going home. Surely, then, she would betray some feeling.

At the old fence which he had climbed so often he stopped, as was his custom, to rest a moment, with his eyes upon the wild beauty before him—the great valley, with mists floating from its gloomy depths into the tremulous moonlight; and far through the radiant space the still, dark masses of the Cumberland lifting themselves in majesty against the east; and in the shadow of the great cliff the vague outlines of the old cabin, as still as the awful silence around it. A light was visible, but he could hear no voices. Still, he knew he would find the occupants seated in the porch, held by that strange quiet which nature imposes on those who dwell much alone with her. He had not been to the cabin for several weeks, and when he spoke, Easter did not return his greeting; Raines nodded almost surlily, but from the mother came as always a cordial welcome.

"I'm mighty glad ter see ye," she said; "ye hev n't been up fer a long time."

"No," answered Clayton; "I have been very busy—getting ready to go home." He had watched Easter closely as he spoke, but the girl did not lift her face, and she betrayed no emotion, not even surprise; nor did Raines. Only the mother showed genuine regret. The girl's apathy filled him with bitter disappointment. She had relapsed into barbarism again. He was a fool to think that in a few months he could counteract influences that had been molding her character for a lifetime. His purpose had been unselfish. Curiosity, the girl's beauty, his increasing power over her, had stimulated him, to be sure, but he had been conscientious and earnest. Somehow he was more than disappointed; he was hurt deeply, not only that he should have been so misunderstood, but for the lack of gratitude in the girl. He was bewildered. What could have happened? Could Raines have really poisoned her mind against him? And indignation shot through Clayton that Easter could believe so easily what might have been said against him, and not allow him a hearing.

"I've been expecting to take a trip home

for several weeks," he found himself saying a moment later; "I think I shall go to-morrow."

He hardly meant what he said; a momentary pique had forced the words from him, but, once spoken, he determined to abide by them. Easter was stirred from her lethargy at last, but Clayton's attention was drawn to Raines's start of surprise, and he did not see the girl's face strangely agitated for an instant, nor her hands nervously trembling in her lap. The mother had made an ejaculation of astonishment.

"Ter-morrer!" she said. "Why, ye almost take my breath away. I declar', I'm downright sorry ye air goin', I hev tuk sech a shine ter ye. I kind o' think I'll miss ye more 'n Easter."

Raines's eyes turned to the girl, as did Clayton's. Not a suggestion of color disturbed the pallor of the girl's face, once more composed, and she said nothing.

"Ye air so jolly 'n' lively," continued the mother, "'n' ye allus hev so much ter say. Ye air not like Easter 'n' Sherd hyar, who talk 'bout as much ez two stumps. I suppose I'll hev ter sit up hyar 'n' talk ter the moon when ye air gone."

The mountaineer rose abruptly, and, though he spoke quietly, he controlled himself with difficulty.

"Ez my company seems ter be unwelcome ter ye," he said, "I kin take it away from ye, 'n' I will."

Before the old woman could recover herself, he was gone.

"Well," she ejaculated, "whut kin be the matter with Sherd? He hev got mighty cur'us hyar of late, 'n' so hev Easter. All o' ye hev been a-settin' up hyar ez ef ye was at a buryin'. I'm a-goin' ter bed. Ye 'n' Easter kin set up ez long ez ye please. I suppose ye air comin' back ag'in ter see us," she said, turning to Clayton.

"I don't know," he answered. "I may not; but if I don't, I won't forget you."

"Well, I wish ye good luck." Clayton shook hands with her, and she went within doors.

Easter had risen, too, with her mother, and was standing in the shadow.

"Good-by," said Clayton, holding out his hand to Easter.

As she turned he caught one glimpse of her face in the moonlight as she dropped it over her bosom, and its whiteness startled him. Her hand was cold when he took it, and her voice was scarcely audible as she faintly repeated his words. She lifted her face as their hands were unclasped, and her lips quivered mutely as if trying to speak; but he had turned to go. For a moment she watched his darkening figure, and then with stifled breath almost staggered into the cabin.

THE road wound around the cliff and back again, and as Clayton picked his way along it he was oppressed by a strange uneasiness. Easter's face, as he last saw it, lay in his mind like a keen reproach. Could he have been mistaken? Had he been too hasty? He recalled the events of the evening. He began to see that it was strange that Raines had shown no surprise when he spoke of going home, and yet had seemed almost startled by the suddenness of his departure. Perhaps the mountaineer knew he was going. It was known at the camp. If he knew, then Easter must have known. Perhaps she had felt hurt because he had not spoken to her earlier. What might Raines not have told her, and honestly, too? Or the mountaineer might have made a shrewd use of his departure. Perhaps he was unconsciously confirming all that Raines might have said. He ought to have spoken to her. Perhaps she could not speak to him. He wheeled suddenly in the path to return to the cabin, and then paused in indecision. It was late; he would wait one day longer.

As he resumed the descent, a noise of something hurrying down through the undergrowth of the cliff-side which towered darkly behind him, startled him, and he stopped in wonder and fear. Nearer, nearer the bushes crackled as though some hunted animal were flying for life through them, and then through the thick hedge there burst the figure of a woman who sank to the ground in the path before him. The flash of yellow hair and a white face in the moonlight told him who it was.

"Easter, Easter!" he exclaimed, in sickening fear. "My God! is that you? Why, what is the matter, child? What are you doing here?"

He stooped above the sobbing girl, and pulled away her hands from her face, tear-stained and broken with pain. The limit of her self-repression was reached at last; the tense nerves, strained too much, had broken; and the passion, so long checked, surged through her like fire. O God! what had he done? He saw the truth at last. In a sudden impulse of tenderness he lifted the girl to her feet and held her, sobbing uncontrollably, in his arms, with her head resting against his breast, pressing his cheek to her hair and soothing her as though she had been a child.

Presently she felt a kiss on her forehead, and, as she looked up with a sudden fierce joy in her eyes, their lips met.

### VIII.

CLAYTON shunned all self-questioning after that night. His deepest emotions stirred by that close embrace on the mountain-side, he gave himself wholly up to the love or infatuation—

he did not ask which—that enthralled him. Whatever it was, its growth had been subtle and swift. There was in it the thrill that might come from taming some wild creature that had never known control, and the gentleness that a generous spirit with such power would feel. These, with the magnetism of the girl's beauty and personality, and the influence of her environment, he had felt for a long time; but now richer chords were set vibrating in response to her

"ACROSS HIS FOREHEAD RAN A CRIMSON SCAR."

great love, the struggle she had against its disclosure, the appeal for tenderness and protection in her final defeat. It was ideal, he told himself, as he sank into the delicious dream; they two alone with nature, above all human life, with its restraints, its hardships, its evils, its distress. For them was the freedom of the open sky lifting its dome above the mountains; for them nothing less kindly than the sun shining its benediction; for their eyes only the changing beauties of day and night; for their ears no sound harsher than the dripping of dew or a bird-song; for them youth, health, beauty, love. And it was primeval love, the love of the first woman for the first man. She knew no convention, no prudery, no doubt. Her life was impulse, and her impulse was love. She was the teacher now, and he the taught; and he stood in wonder and awe when the plant he had tended flowered into such beauty in a single night. Ah, the happy, happy days that followed! The veil that had for a long time been unfolding itself between him and his previous life seemed to have almost fallen, and they were left alone to their happiness. The mother kept her own counsel. Raines had disappeared as though Death had claimed him. And the dream lasted till a summons home broke

into it as the sudden flaring up of a candle will shatter a reverie at twilight.

## IX.

THE summons was from his father, and was emphatic; and Clayton did not delay. The girl accepted his departure with a pale face, but with a quiet submission that touched him. Of Raines he had seen nothing and heard nothing since the night he had left the cabin in anger; but as he came down the mountain after bidding Easter good-by, he was startled by the mountaineer stepping from the bushes into the path.

"Ye air a-goin' home, I hear," he said quietly.

"Yes," answered Clayton; "at midnight."

"Well, I'll walk down with ye a piece, ef ye don't mind. Hit 's not out o' my way."

As he spoke his face was turned suddenly to the moonlight. The lines in it had sunk deeper, giving it almost an aged look; and the eyes were hollow as from physical suffering or from fasting. He preceded Clayton down the path, with head bent in thought, and saying nothing till they reached the spur of the mountain. Then in the same voice:

"I wanter talk ter ye awhile, 'n' I'd like ter hev ye step inter my house. I don't mean ye no harm," he added quickly, "'n' hit ain't fur."

"Certainly," said Clayton.

The mountaineer turned into the woods by a narrow path, and soon the outlines of a miserable little hut were visible through the dark woods. Raines thrust the door open. The single room was dark except for a few dull coals in a gloomy cavern which formed the fireplace.

"Sit down, ef ye kin find a cheer," said Raines, "'n' I'll fix up the fire."

"Do you live here alone?" asked Clayton, as he heard the keen, smooth sound of the mountaineer's knife going through wood.

"Yes," he answered; "fer five years."

The coals brightened; tiny flames shot from them, and in a moment the blaze caught the dry fagots, and shadows danced over floor, wall, and ceiling, and vanished as the mountaineer rose from his knees. The room was as bare as the cell of a monk. A rough bed stood in one corner; a few utensils hung near the fireplace, wherein were remnants of potatoes roasting in the ashes, and close to the wooden shutter which served as a window was a rough table. On it lay a large book,—a Bible,—a pen, a bottle of ink, and a piece of paper on which were letters traced with great care and difficulty. The mountaineer did not sit down, but began pacing the floor behind Clayton. Clayton moved his chair, and Raines seemed uncon-

scious of his presence as with eyes on the floor he traversed the narrow width of the cabin. At length he spoke:

"Ye hev n't seed me up on the mount'in lately, hev ye?" he asked. "I reckon ye hev n't missed me much. Do ye know whut I hev been doin'?" he asked with sudden vehemence, stopping still and resting his eyes, which glowed like an animal's from the darkened end of the cabin, on Clayton.

"I hev been tryin' ter keep from killin' ye. Oh, don't move—don't fear now; ye air as safe ez ef ye were down in ther camp. I seed ye that night on ther mount'in," he continued, again pacing rapidly backward and forth. "I was waitin' fer ye. I meant ter tell ye jest whut I'm goin' ter tell ye ter-night; 'n' when Easter come a-tearin' through ther bushes, 'n' I seed ye—ye—a-standin' together,"—the words seemed to stop in his throat,—"I knowed I was too late.

"I set thar fer a minute like a rock, 'n' when ye two went back up ther mount'in, before I knowed it I was hyar in ther house thar at the fire moldin' a bullet ter kill ye with ez ye come back. All to oncet I heerd a voice ez plain ez my own is et this minute say:

"'Air ye a-thinkin' 'bout takin' ther life of a fellow-creetur, Sherd Raines—ye thet air tryin' ter be a servant o' ther Lord?'"

"But I kept on a-moldin', 'n' suddenly I seed ye a-lyin' in the road dead, 'n' ther heavens opened, 'n' ther face o' ther Lord appeared, 'n' he raised his hand ter smite me with ther brand o' Cain—'n' look thar!"

Clayton had sat spellbound by the terrible earnestness of the man, and as the mountaineer swept his dark hair back with one hand, he rose in sudden horror. Across the mountaineer's forehead ran a crimson scar yet unhealed. Could he have inflicted upon himself this fearful penance?

"Oh, it was only ther molds. I seed it all so plain thet I throwed up my hands, fergittin' ther molds, 'n' ther hot lead struck me thar; but," he continued solemnly, "I knowed ther Lord hed tuk thet way o' punishin' me fer ther sin o' havin' murder in my mind, 'n' I fell on my knees a-prayin' fer forgiveness; 'n' since thet night I hev stayed away from ye till ther Lord give me power ter stand ag'in' ther temptation of harmin' ye. He hev showed me anuther way, 'n' now I hev come ter ye ez he has directed me. I hev n't tol' ye this fer nuthin'. Ye kin see now whut I think o' Easter, ef I war tempted to take the life o' ther man who tuk her love from me, 'n' I think ye will say I hev ther right ter ask ye whut I'm a-goin' ter. I hev known ther gal all my life. We was children together, and thar hain't no use hidin' thet I hev never keered fer anuther woman. She used ter be mighty

wilful 'n' contrary, but ez soon ez ye come I seed at oncet that a change was comin' over her. I mistrusted ye, 'n' I warned her ag'in' ye. But when I l'arned that ye was a-teachin' her, and a-doin' whut I had tried my best ter do, 'n' failed, I let things run along, thinkin' that mebbe everythin' would come out all right atter all. But now ef ye don't think ez much of Easter ez she does of ye, ye ought ter—'n' I come to ye now, 'n' I ask ye in the name of ther livin' God, who is a-watchin' ye 'n' a-guidin' me, air ye goin' ter leave ther po' gal ter die out o' grier fer ye, or do ye mean ter come back 'n' marry her?"

Raines had stopped now in the center of the cabin, and the shadows flickering slowly over him gave an unearthly aspect to his tall, gaunt figure, as he stood with uplifted arm, pale, tense face, glowing eyes, and disordered hair.

"The gal hez no protector,—her dad, ez ye know, is a-hidin' from justice in ther mountains,—and I 'm a-standin' in his place, 'n' I ax ye only ter do whut yer know ye ought."

There was nothing threatening in the mountaineer's attitude, nor dictatorial; and Clayton felt his right to say what he had in spite of a natural impulse to resent such interference. Besides, there grew up in his heart a sudden great admiration for this rough, uncouth fellow who was capable of such unselfishness; who, true to the trust of her father and his God, was putting aside the strongest passion of his life for what he believed was the happiness of the woman who had inspired it. He saw, too, that the sacrifice was made with perfect unconsciousness that it was unusual or admirable. He rose to his feet, and the two men faced each other.

"If you had told me this long ago," said Clayton, "I would have gone away; but you seemed distrustful and suspicious. I did not expect the present state of affairs to come about, but since it has, I tell you frankly that I have never thought of doing anything else than what you have asked."

And he told the truth, for he had already asked himself that question. Why should he not marry her? He must in all probability stay in the mountains for years, and after that time he would not be ashamed to take her home, so strong was his belief in her quickness and adaptability.

Raines seemed scarcely to believe what he heard. He had not expected such ready acquiescence. He had almost begun to fear from Clayton's silence that he was going to refuse, and then—God knows what he would have done.

Instantly he stretched out his hand:

"I hev done ye great wrong, 'n' I ax yer par-

din," he said huskily. "I want ter say that I bear no grudge, 'n' that I wish ye well, 'n' I believe ye 'll do yer best ter make ther gal happy. I hope ye won't think hard on me," he continued; "I hev had a hard fight with ther devil ez long ez I kin remember. I hev turned back time 'n' ag'in, but thar hain't nuthin' ter keep me from goin' straight ahead now."

As Clayton left the cabin, the mountaineer stayed him for a moment at the threshold.

"Thar's another thing I reckon I ought ter tell ye," he said: "Easter's dad air powerfully sot ag'in' ye. He thought ye was an officer at fust, 'n' 't was hard ter git him out o' ther idee that ye was spyin' fer him; 'n' when he seed ye goin' ter ther house, he got it inter his head that ye might be meanin' harm ter Easter, who air ther only thing alive that he keers fer much. He promised not ter tech ye, 'n' I knowed he would keep his word ez long ez he was sober. It 'll be all right now, I reckon," he concluded, "when I tell him whut ye mean ter do, though he hev got a spite ag'in' all furniners. Far'well! I wish ye well; I wish ye well."

An hour later Clayton was in Jellico. It was midnight when the train came in, and he went immediately to his berth. Striking the curtain accidentally, he loosed it from its fastenings, and, doubling the pillows, he lay looking out on the swiftly passing landscape. The moon was full and brilliant, and there was a strange, keen pleasure in being whirled in such comfort through the night. The mists almost hid the mountains. They seemed very, very far away. A red star trembled almost in the crest of Wolf Mountain. Easter's cabin must be almost under that star, he thought. He wondered if she were asleep. Perhaps she was out in the porch, lonely, suffering, and thinking of him. He felt her kiss and her tears upon his hand. Did he not love her? Could there be any doubt about that? His thoughts turned to Raines, and he saw the mountaineer in his lonely cabin, sitting with his head bowed in his hands in front of the dying fire. He closed his eyes, and another picture rose before him—a scene at home. He had taken Easter to New York. How brilliant the light! what warmth and luxury! There stood his father, there his mother. What gracious dignity they had! Here was his sister—what beauty and elegance and grace of manner! But Easter! Wherever she was placed the other figures needed readjustment. There was something irritably incongruous—Ah! now he had it—his mind grew hazy—he was asleep.

x.

DURING the weeks that followed, some malignant spirit seemed to be torturing him with

a slow realization of all he had lost ; taunting him with the possibility of regaining it and the certainty of losing it forever.

As he had stepped from the dock at Jersey City, the fresh sea wind had thrilled him like a memory, and his pulses leaped instantly into sympathy with the tense life that vibrated in the air. He seemed never to have been away so long, and never had home seemed so pleasant. His sister had grown more beautiful ; his mother's quiet, noble face was smoother and fairer than it had been for years ; and despite the absence of his father, who had been hastily summoned to England, there was an air of cheerfulness in the house that was in marked contrast to its gloom when Clayton was last at home. He had been quickened at once into a new appreciation of the luxury and refinement about him, and he soon began to wonder how he had ever inured himself to the discomforts and crudities of his mountain life. Old habits easily resumed sway over him. At the club friends and acquaintances were so unfeignedly glad to see him that he began to suspect that his own inner gloom had darkened their faces after his father's misfortune. Day after day found him in his favorite corner at the club, watching the passing pageant and listening almost eagerly to the conversational froth of the town — the gossip of club, theater, and society. His ascetic life in the mountains gave to every pleasure the taste of inexperience. His early youth seemed renewed, so keen and fresh were his emotions. He felt, too, that he was recovering a lost identity, and still the new one that had grown around him would not loosen its claim. He had told his family nothing of Easter,—why, he could scarcely have said,—and the difficulty of telling increased each day. His secret began to weigh heavily upon him ; and though he determined to unburden himself on his father's return, he was troubled with a vague sense of deception. When he went to receptions with his sister, this sense of a double identity was strangely felt amid the lights, the music, the flowers, the flash of eyes and white necks and arms, the low voices, the polite, clear-cut utterances of welcome and compliment.

Several times he had met a face for which he had once had a boyish infatuation. Its image had never been supplanted during his student career, but he had turned from it as from a star when he came home and found that his life was to be built with his own hands. Now the girl had grown to gracious womanhood, and when he saw her he could scarcely repress a thrill of joy that she had once favored him above all others. One night a desire had assailed him to learn upon what footing he then stood. He had yielded, and she gave him a kindly wel-

come. They had drifted to reminiscences, and that night Clayton went home with a troubled heart ; angry that he should be so easily disturbed, surprised that the days were passing so swiftly, and pained that they were filled less and less with thoughts of Easter. With a pang of remorse and fear, he determined to go back to the mountains as soon as his father came home. He knew the effect of habit. He would forget these pleasures felt so keenly now, as he had once forgotten them, and he would leave before their hold upon him was secure.

Knowing the danger that beset him, he had avoided it all he could. He even stopped his daily visits to the club, and spent most of his time at home with his mother and sister. Once only, to his bitter regret, was he induced to go out. Wagner's tidal wave had reached New York, and it was the opening night of the season ; and the opera was one that he had learned to love in Germany. The very brilliancy of the scene threw him into gloom, so aloof did he feel from it all—the great theater aflame with lights, the circling tiers of faces, the pit with its hundred musicians, their eyes on the leader, who stood above them with baton upraised and German face already aglow.

In his student days he had loved music, but he had little more than trifled with it ; now, strangely enough, his love, even his understanding, seemed to have grown ; and when the violins thrilled all the vast space into life, he was shaken as with a passion newly born. All the evening he sat riveted. A rush of memories came upon him—memories of his student life with its dreams and ideals of culture and scholarship, which rose from his past again like phantoms. In the elevation of the moment the trivial pleasures that had been tempting him suddenly became mean and unworthy. With a pang of regret he saw himself as he might have been, as he yet might be.

A few days later his father came home, and his distress of mind was complete. Clayton need stay in the mountains but little longer, he said ; he was fast making up his losses, and he had hoped after his trip to England to have Clayton at once in New York ; but now he had best wait perhaps another year. Then had come a struggle that racked heart and brain. All he had ever had was before him again. Could it be his duty to shut himself from this life,—his natural heritage,—to stifle the highest demands of his nature? Was he seriously in love with that mountain girl? Had he indeed ever been sure of himself? If, then, he did not love her beyond all question, would he not wrong himself, wrong her, by marrying her? Ah, but might he not wrong her, wrong himself—even more? He was bound to her by every tie that his sensitive honor recog-

nized among the duties of one human being to another. He had sought her; he had lifted her above her own life. If one human being had ever put its happiness in the hands of another, that had been done. If he had not deliberately taught her to love him, he had not tried to prevent it. He could not excuse himself; the thought of gaining her affection had occurred to him, and he had put it aside. There was no excuse; for when she gave her love, he had accepted it, and, as far as she knew, had given his own unreservedly. Ah, that fatal moment of weakness that night on the mountain-side! Could he tell her, could he tell Raines, the truth, and ask to be released? What could Easter with her devotion, and Raines with his singleness of heart, know of this substitute for love which civilization had taught him? Or, granting that they could understand, he might return home; but Easter—what was left for her?

It was useless to try to persuade himself that her love would fade away, perhaps quickly, and leave no scar; that Raines would in time win her for himself, his first idea of their union be realized, and, in the end, all happen for the best. That might easily be possible with a different nature under different conditions—a nature less passionate, in contact with the world and responsive to varied interests; but not with Easter—alone with a love that had shamed him, with mountain, earth, and sky unchanged, and the vacant days marked only by a dreary round of wearisome tasks. He remembered Raines's last words—"Air ye goin' ter leave ther po' gal ter die out o' grief fer ye?" What happiness would be possible for him with that lonely mountain-top and the white drawn face forever haunting him?

That very night a letter came, with a rude superscription—the first from Easter. Within it was a poor tintype, from which Easter's eyes looked shyly at him. Before he left he had tried in vain to get her to the tent of an itinerant photographer, and, during his absence, she had evidently gone of her own accord. The face was very beautiful, and in it was an expression of questioning, modest pride. "Aren't you surprised?" it seemed to say—"and pleased?" Only the face, with its delicate lines, and the throat and the shoulders were visible. She looked almost refined. And the note—it was badly spelled and written with great difficulty, but it touched him. She was lonely, she said, and she wanted him to come back. Lonely—that cry was in each line.

His response to this was an instant resolution to go back at once, and sensitive, ease-loving, and pliant as his nature was, there was no hesitation for him when his duty was clear and a decision once made. With great care and per-

fect frankness he had traced the history of his infatuation in a letter to his father, to be communicated when the latter chose to his mother and sister. Now he was nearing the mountains again.

## XI.

THE journey to the mountains was made with a heavy heart. In his absence everything seemed to have undergone a change. Jellico had never seemed so small, so coarse, so wretched as when he stepped from the dusty train and saw it lying dwarfed and shapeless in the afternoon sunlight. The State line bisects the straggling streets of frame-houses. On the Kentucky side an extraordinary spasm of morality had quieted into local option. Just across the way in Tennessee was a row of saloons. It was "pay-day" for the miners, and the worst element of all the mines was drifting in to spend the following Sabbath in every kind of unchecked vice. Several rough, brawny fellows were already staggering from Tennessee into Kentucky, and around one saloon hung a crowd of slatternly negroes, men and women. Heart-sick with disgust, Clayton hurried into the lane that wound through the valley. Were these hovels, he asked himself in wonder, the cabins he once thought so poetic, so picturesque? How was it that they suggested now only a pitiable poverty of life? From each, as he passed, came a rough, cordial shout of greeting. Why was he jarred so strangely? Even nature had changed. The mountains seemed stunted, less beautiful. The light, streaming through the western gap with all the splendor of a mountain sunset, no longer thrilled him. The moist fragrance of the earth at twilight, the sad pipings of birds by the wayside, the faint, clear notes of a wood-thrush—his favorite—from the edge of the forest, even the mid-air song of a meadow-lark above his head, were unheeded as, with face haggard with thought and travel, he turned doggedly from the road up the mountain toward Easter's home. The novelty and ethnological zeal that had blinded him to the disagreeable phases of mountain life were gone; so was the pedestal from which he had descended to make a closer study of the people. For he felt now that he had gone among them with an unconscious condescension; his interest seemed now to have been little more than curiosity—a pastime to escape brooding over his own change of fortune. And with Easter—ah, how painfully clear his mental vision had grown! Was it the tragedy of wasting possibilities that had drawn him to her,—to help her,—or was it his own miserable selfishness after all?

No one was visible when he reached the cabin. The calm of mountain and sky en-

thrilled it as completely as the cliff that towered behind it. The day still lingered, and the sunlight rested lightly on each neighboring crest. As he stepped upon the porch, there was a slight noise within the cabin, and, peering into the dark interior, he called Easter's name. There was no answer, and he sank wearily into a chair, his thoughts reverting homeward. By the time his mother and sister must know why he had come back to the mountains. He could imagine their consternation and grief. Perhaps that was only the beginning; he might be on the eve of causing them endless unhappiness. He had thought to involve them as little as possible by remaining in the mountains; but the thought of living there was now intolerable in the new relations he would sustain to the people. What should he do? where go? As he bent forward in perplexity, there was a noise again in the cabin,—this time the stealthy tread of feet,—and before he could turn, a rough voice vibrated threateningly in his ears:

"Say who ye air, and what yer business is, mighty quick, er ye hain't got er minute ter live."

Clayton looked up, and to his horror saw the muzzle of a rifle pointed straight at his head. At the other end of it, and standing in the door, was a short, stocky figure, a head of bushy hair, and a pair of small, crafty eyes. The fierceness and suddenness of the voice, in the great silence about him, and its terrible earnestness, left him almost paralyzed.

"Come, who air ye? Say quick, and don't move, nuther."

Clayton spoke his name with difficulty. As he did so, the butt of the rifle dropped to the floor, and with a harsh laugh its holder advanced to him with hand outstretched:

"So ye air Easter's feller, air ye? Well, I'm yer dad—that's to be. Shake."

Clayton shuddered. Good heavens! this was Easter's father! More than once or twice his name had never been mentioned at the cabin.

"I tuk ye fer an officer," continued the old mountaineer, not noticing Clayton's repulsion, "'n' ef ye had 'a' been, ye wouldn't be nobody now. I reckon Easter hain't told ye much about me, 'n' I reckon she hev a right ter be a leetle ashamed of me. I hed a leetle trouble down thar in the valley,—I s'pose you've hearn about it,—'n' I've had ter keep kind o' quiet. I seed ye once afore, 'n' I came near shootin' ye, thinkin' ye war an officer. Am mighty glad I did n't, fer Easter is powerful sot on ye. Sherd thought I could resk comin' down ter ther weddin'. They hev kind o' gi'n up ther s'arch, 'n' none o' ther boys won't tell on me. We'll hev an old-timer, I tell ye. Ye folks from ther settlemint's air mighty high-heeled, but old Bill Hicks don't allus go barefooted. He kin step

purty high, 'n' he 's goin' ter do it at thet weddin'. Hev somefin'?" he asked, suddenly pulling out a flask of colorless liquid. "Ez ye air to be one o' ther fambly, I don't mind tellin' ye thar 's the very moonshine thet caused the leetle trouble down in ther valley."

For fear of giving offense, Clayton took a swallow of the liquid, which burned him like fire. He had scarcely recovered from the first shock, and he had listened to the man and watched him with a sort of entralling fascination. He was Easter's father. He could even see a faint suggestion of Easter's face in the cast of the features before him, coarse and degraded as they were. He had the same nervous, impetuous quickness, and, horrified by the likeness, Clayton watched him sink back into a chair, pipe in mouth, and relapse into a stolidity that seemed incapable of the energy and fire shown scarcely a moment before. His life in the mountains had made him as shaggy as some wild animal. He was coatless, and his trousers of jeans were upheld by a single home-made suspender. His beard was yet scarcely touched with gray, and his black, lusterless hair fell from beneath a round hat of felt with ragged edges and uncertain color. The mountaineer did not speak again until, with great deliberation and care, he had filled a cob pipe. Then he bent his sharp eyes upon Clayton so fixedly that the latter let his own fall.

"Mebbe ye don't know thet I'm ag'in' fur-riners," he said abruptly, "all o' ye; 'n' ef ther Lord hisself hed 'a' tol' me thet my gal would be a-marryin' one, I would n't 'a' believed him. But Sherd hev tol' me ye air all right, 'n' ef Sherd says ye air, why, ye air, I reckon, 'n' I hev n't got nuthin' ter say; though I hev got a heap ag'in' ye—all o' ye."

His voice had a hint of growing anger under the momentary sense of his wrongs, and, not wishing to incense him further, Clayton said nothing.

"Ye air back a little sooner than ye expected, ain't ye?" he asked presently, with an awkward effort at good humor. "I reckon ye air gittin' anxious. Well, we hev been gittin' ready fer ye, 'n' ye 'n' Easter kin hitch ez soon ez ye please. Sherd Raines air goin' ter do ther marryin'. He air the best friend I've got. Sherd was in love with ther gal, too, but he hev n't got no grudge ag'in' ye, 'n' he hev promised ter tie ye. Sherd air a preacher now. He hev just got his license. He did n't want ter do it, but I told him he had ter. We'll hev ther biggest weddin' ever seed in these mountains, I tell ye. Any o' yer folks be on hand?"

"No," answered Clayton, soberly; "I think not."

"Well, I reckon we kin fill up ther house." Clayton's heart sank at the ordeal of a wed-

dying with such a master of ceremonies. He was about to ask where Easter and her mother were, when, to his relief, he saw them both in the path below, approaching the house. The girl was carrying a bucket of water on her head. Once he would have thought her picturesque, but now it pained him to see her doing such rough work. When she saw him she gave a cry of surprise and delight that made Clayton tingle with remorse. Then running to him with glowing face, she stopped suddenly, and, with a look down at her bare feet and soiled gown, fled into the cabin. Clayton followed, but the room was so dark he could see nothing.

"Easter!" he called. There was no answer, but he was suddenly seized about the neck by a pair of unseen arms and kissed by unseen lips twice in fierce succession, and before he could turn and clasp the girl, she was laughing softly in the next room, with a barred door between them. Clayton waited patiently several minutes, and then asked:

"Easter, are n't you ready?"

"Not yit—not *yet*," she corrected herself with such vehemence that Clayton laughed. She came out presently, and blushed when Clayton looked her over from head to foot with astonishment. She was simply and prettily dressed in white muslin; a blue ribbon was about her throat, and her hair was gathered in a Psyche knot that accented the classicism of her profile. Her appearance was really refined and tasteful. When they went out on the porch, he noticed that her hands had lost their tanned appearance. Her feet were slipped, and she wore black stockings. He remembered the book of fashion-plates he had once sent her; it was that that had quickened her instinct of dress. He said nothing, but the happy light in Easter's face shone brighter as she noted his pleased and puzzled gaze.

"Why, ye look like another man," said Easter's mother, who had been looking Clayton over with a quizzical smile. "Is thet the way folks dress out in ther settlements? 'N' look at thet gal. Ef she hev done anythin' sence ye hev been gone but—" The rest of the sentence was smothered in the palm of Easter's hand, who now began scrutinizing Clayton closely. The mountaineer said nothing, and after a curious glance at Easter resumed his pipe.

"Ye look like a pair o' butterflies," said the mother when released. "Sherd oughter be mighty proud of his first marryin'. I s'pose ye know he air a preacher now? Ye oughter heard him preach last Sunday. It was his fust time. The way he lighted inter the furriners was a caution. He 'lowed he was a-goin' ter fight card-playin' and dancin' ez long ez he hed breath."

"Yes; 'n' thar 's whar Sherd air a fool. I 'm ag'in' furriners, too, but thar hain't no harm in dancin', 'n' thar 's goin' ter be dancin' at this weddin' ef I 'm alive."

Easter shrank perceptibly when her father spoke, and looked furtively at Clayton, who winced, in spite of himself, as the rough voice grated in his ear. Instantly her face grew unhappy, and contained an appeal for pardon that he was quick to understand and appreciate. Thereafter he concealed his repulsion, and treated the rough bear so affably that Easter's eyes grew moist with gratitude.

Darkness was gathering in the valley below when he rose to go. Easter had scarcely spoken to him, but her face and her eyes, fixed always upon him, were eloquent with joy. Once as she passed behind him her hand rested with a timid, caressing touch upon his shoulder, and now as he walked away from the porch she called him back. He turned, and she had gone into the house.

"What is it, Easter?" he asked, stepping into the dark room. His hand was grasped in both her own and held tremblingly.

"Don't mind dad," she whispered softly. Something warm and moist fell upon his hand as she unloosed it, and she was gone.

That night he wrote home in a more cheerful frame of mind. The charm of the girl's personality had asserted its power again, and hopes that had almost been destroyed by his trip home were rekindled by her tasteful appearance, her delicacy of feeling, and by her beauty, which he had not overrated. He asked that his sister might meet him in Louisville after the wedding—whenever that should be. They two could decide then what should be done. His own idea was to travel; and so great was his confidence in Easter, he believed that, in time, he could take her to New York without fear.

## XII.

It was plain that Raines—to quiet the old man's uneasiness, perhaps—had told him of his last meeting with Clayton, and that, during the absence of the latter some arrangements for the wedding had been made, even by Easter, who in her trusting innocence had perhaps never thought of any other end to their relations. In consequence, there was an unprecedented stir among the mountaineers. The marriage of a "citizen" with a "furriner" was an unprecedented event, and the old mountaineer, who began to take some pride in the alliance, emphasized it at every opportunity.

At the mines Clayton's constant visits to the mountain were known to everybody, but little attention had been paid to them. Now, however, when the rumor of the wedding seemed

confirmed by his return and his silence, every one was alert with a curiosity shown so frankly that he soon became eager to get away from the mountains. Accordingly, he made known his wish to Easter's parents that the marriage should take place as soon as possible. Both received the suggestion with silent assent. Then had followed many difficulties. Only as a great concession to the ideas and customs of "furriners" would the self-willed old mountaineer agree that the ceremony should take place at night; and that after the supper and the dance, the two should leave Jellico at day-break. Mountain marriages were solemnized in the daytime, and wedding journeys were unknown. The old man did not understand why Clayton should wish to leave the mountains, and the haste of the latter seemed to give him great offense. When Clayton had ventured to suggest, instead, that the marriage should be quiet, and that he and Easter should remain on the mountain a few days before leaving, he was kindled into a blaze of anger; and thereafter, any suggestion from the young engineer was met with a suspicion that looked ominous. Raines was away on his circuit, and would not return until just before the wedding, so that from him Clayton could get no help. Very wisely, then, he interfered no more, but awaited the day with dread.

It was nearing dusk when he left the camp on his wedding-night. Half-way up the mountain he paused to lean against the kindly breast of a boulder blocking the path. It was the spot where he had seen Easter for the first time. The mountains were green again, as they were then, but the scene seemed sadly changed. The sun was gone; the evening star had swung its white light like a censer above Devil's Den; the clouds were moving swiftly through the darkening air, like a frightened flock seeking a fold; and the night was closing fast over the cluster of faint camp-fires. The spirit brooding over mountain and sky was unspeakably sad, and with a sharp pain at his heart Clayton turned from it, and hurried on. Mountain, sky, and valley were lost in the night. When he reached the cabin, rays of bright light were flashing from chink and crevice into the darkness, and from the kitchen came the sounds of busy preparation. Already many guests had arrived. A group of men who stood lazily talking in the porch became silent as Clayton approached, but he, recognizing none of them, entered the cabin. A dozen women were seated about the room, and instantly their eyes were glued upon him. As the kitchen door swung open, he saw Easter's mother bending over the fireplace, a table already heavily laden, and several women bustling about it. Above his head he heard laughter, a hurried tramping

of feet, and occasional exclamations of surprise and delight. He paused at the threshold, hardly knowing what to do, and as he turned a titter from one corner showed that his embarrassment had been detected. On the porch he was seized by Easter's father, who drew him back into the room. The old mountaineer's face was flushed, and he had been drinking heavily.

"Oh, hyar ye air!" he exclaimed. "Ye air right on hand, hain't ye? Hyar, Bill," he called, thrusting his head out of the door, "you 'n' Jim 'n' Milt come in hyar." Three awkward young mountaineers entered. "These fellers air goin' ter help ye."

They were to be his ushers. Clayton shook hands with them gravely.

"Oh, we air about ready fer ye, 'n' we air only waitin' fer Sherd and the folks ter come," continued the mountaineer, jubilantly, winking significantly at Clayton and his attendants, who stood about him at the fireplace. Clayton shook his head firmly, but the rest followed Hicks, who turned at the door and repeated the invitation with a frowning face. Clayton was left to be the focus of feminine eyes, whose unwavering directness kept his own gaze on the floor. People began to come rapidly, most of whom he had never seen before. The room was filled, save for a space about him. Every one gave him a look of curiosity that made him feel like some strange animal on exhibition. Once more he tried to escape to the porch, and again he was met by Easter's father, who this time was accompanied by Raines.

The young circuit-rider was smoothly shaven, and dressed in dark clothes, and his calm face and simple but impressive manner seemed at once to alter the atmosphere of the room. He grasped Clayton's hand warmly, and without a trace of self-consciousness. The room had grown instantly quiet, and Raines began to share the curious interest that Clayton had caused; for the young mountaineer's sermon had provoked discussion far and wide, and, moreover, the peculiar relations of the two toward Easter were known and rudely appreciated. Hicks was subdued into quiet respect, and tried to conceal his incipient intoxication. The effort did not last long. When the two fiddlers came, he led them in with a defiant air, and placed them in the corner, bustling about officiously but without looking at Raines, whose face began to cloud.

"Well, we 're all hyar, I reckon," he exclaimed in his terrible voice. "Is Easter ready?" he shouted up the steps.

A confused chorus answered him affirmatively, and he immediately arranged Clayton in one corner of the room with his serious attendants on one side, and Raines, grave to solemnity, on the other. Easter's mother and her assistants

came in from the kitchen, and the doors were filled with faces. Above, the tramping of feet became more hurried; below, all stood with expectant faces turned to the rude staircase. Clayton's heart began to throb, and a strange light brightened beneath Raines's heavy brows.

"Hurry up, thar!" shouted Hicks, impatiently.

A moment later two pairs of rough shoes came down the steps, and after them two slipped feet that fixed every eye in the room, until the figure and face above them slowly descended into the light. Midway the girl paused with a timid air. Had an angel been lowered to mortal view, the waiting people would not have been stricken with more wonder. Raines's face relaxed into a look almost of awe, and even Hicks for the instant was stunned into reverence. Mountain eyes had never beheld such loveliness so arrayed. It was simple enough,—the garment,—all white, and of a misty texture, yet it formed a mysterious vision to them. About the girl's brow was a wreath of pink and white laurel. A veil had not been used. It would hide her face, she said, and she did not see why that should be done. For an instant she stood poised so lightly that she seemed to sway like a vision, as the candle-lights quivered about her, with her hands clasped in front of her, and her eyes wandering about the room till they lighted upon Clayton with a look of love that seemed to make her conscious only of him. Then, with quickening breath, lips parted slightly, cheeks slowly flushing, and shining eyes still upon him, she moved slowly across the room until she stood at his side. Her attendants, who, woman-like, had been gazing triumphantly around to note the effect of her presence, followed awkwardly.

Raines gathered himself together as from a dream, and stepped before the pair. Broken and husky at first, his voice trembled in spite of himself, but thereafter there was no hint of the powerful emotions at play within him. Only as he joined their hands, his eyes rested an instant with infinite tenderness on Easter's face, —as though the look were a last farewell,—and his voice deepened with solemn earnestness when he bade Clayton protect and cherish her until death. There was a strange mixture in those last words of the office and the man, —of divine authority and personal appeal,—and Clayton was deeply stirred. The benediction over, the young preacher was turning away, when some one called huskily from the rear of the cabin:

"Why don't ye kiss ther bride?"

It was Easter's father, and the voice, rough as it was, brought a sensation of relief to all. The young mountaineer's features contracted

with swift pain, and as Easter leaned toward him with subtle delicacy, he touched, not her lips, but her forehead, as reverently as though she had been a saint.

Instantly the fiddles began, the floor was cleared, the bridal party hurried into the kitchen, and the cabin began to shake beneath dancing feet. Hicks was fulfilling his word, and in the kitchen his wife had done her part. Everything known to the mountaineer palate was piled in profusion on the table, but Clayton and Easter ate nothing. To him the whole evening was a nightmare, which the solemn moments of the marriage had made the more hideous. He was restless and eager to get away. The dancing was becoming more furious, and above the noise rose Hicks's voice prompting the dancers. The ruder ones still hung about the doors, regarding Clayton curiously, or with eager eyes upon the feast. Easter was vaguely troubled, and conflicting with the innocent pride and joy in her eyes were the questioning glances she turned to Clayton's darkening face. At last they were hurried out, and in came the crowd like hungry wolves.

Placing Clayton and Easter in a corner of the room, the attendants themselves took part in the dancing, and such dancing Clayton had never seen. Doors and windows were full of faces, and the room was crowded; from the kitchen came coarse laughter and the rattling of dishes. Occasionally Hicks would disappear with several others, and would return with his face redder than ever.

Easter became uneasy. Once she left Clayton's side and expostulated with her father, but he shook her from his arm roughly. Raines saw this, and a moment later he led the old mountaineer from the room. Thereafter the latter was quieter, but only for a little while. Several times the kitchen was filled and emptied, and ever was the crowd unsteadier. Soon even Raines's influence was of no avail, and the bottle was passed openly from guest to guest.

"Why don't ye dance?"

Clayton felt his arm grasped, and Hicks stood swaying before him.

"Why don't ye dance?" he repeated. "Can't ye dance? Mebbe ye air too good—like Sherd. Well, Easter kin. Hyar, Mart, come 'n' dance with ther gal. She air the best dancer in these parts."

Clayton laid his hand upon Easter as though to forbid her. The mountaineer saw the movement, and his face flamed with sudden fury; but before he could speak, the girl pressed Clayton's arm and, with an appealing glance, rose to her feet.

"Thet 's right," said her father, approvingly, but with a look of drunken malignancy toward

Clayton. "Now," he called out in aloud voice, "I want this couple ter have ther floor, 'n' everybody ter look on 'n' see what is dancin'. Start the fiddles, boys."

It was dancing. The young mountaineer was a slender, active fellow, not without grace, and Easter seemed scarcely to touch the floor. They began very slowly at first, till Easter, glancing aside at Clayton and seeing his face deepen with interest, and urged by the remonstrances of her father, the remarks of the onlookers, and the increasing abandon of the music, gave herself up to the dance. The young mountaineer was no mean partner. Forward and back they glided, their swift feet beating every note of the music; Easter receding before her partner, and now advancing toward him, now whirling away with a disdainful toss of head and arms, and now giving him her hand and whirling till her white skirts floated from the floor. At last, with head bent coquettishly toward her partner, she danced around him, and when it seemed that she would be caught by his outstretched hands she slipped from his clasp, and, with flaming cheeks, flashing eyes, and bridal wreath showering its pink and white petals about her, flew to Clayton's side.

"Mebbe ye don't like that," cried Hicks, turning to Raines, who had been gravely watching the scene.

Raines hesitated in reply, but only looked the drunken man in the face.

"You, too," he continued, indicating Clayton with an angry shake of his head, "air a-tryin' ter spile everybody's fun. Both of ye air too high-heeled fer us folks. Ye hev got mighty good now thet ye air a preacher," he added, with a drunken sneer, irritated beyond endurance by Raines's silence and his steady look. "I want ye ter know Bill Hicks air a-runnin' things here, 'n' I don't want no interferin'. I'll drink right here in front o' ye,"—holding a bottle defiantly above his head,—"'n' I mean ter dance, too. I warn ye now," he added, staggering toward the door, "I don't want no interferin'."

During this scene Easter had buried her face in her hands. Her mother stood near her husband, helplessly trying to get him away, and fearing to arouse him more. Raines was the most composed man in the room, and a few moments later, when dancing was resumed, Clayton heard his voice at his ear:

"Ye had better go up-stairs 'n' wait till it's time ter go," he said. "He hev got roused ag'in' ye, and ag'in' me too. I'll keep out o' his way so as not to aggravate him, but I'll stay hyar fer fear something will happen. Mebbe he'll sober up a little, but I'm afeard he'll drink more 'n ever."

Raines had noticed the vindictive glances

of Hicks toward Clayton during the night, and he had felt vaguely Clayton's distress of mind.

A moment later, unseen by the rest, the two mounted the stairway to the little room where Easter's girlhood had been passed. To Clayton the peace of the primitive little chamber was an infinite relief. A dim light showed a rude cot in one corner and a pine table close by whereon lay a few books and a pen and an ink-bottle. Above, the roof rose to a sharp angle, and the low, unplastered walls were covered with pictures cut from the books he had given her. A single window opened into the night over the valley and to the mountains beyond. Two small cane-bottom chairs were near this, and in these they sat down. In the east dark clouds were moving swiftly across the face of the moon, checking its light and giving the dim valley startling depth and blackness. Raindrops struck the roof at intervals, a shower of apple-blossoms rustled against the window and drifted on, and below the muffled sound of music and shuffling feet was now and then pierced by the shrill calls of the prompter. There was something ominous in the persistent tread of feet and the steady flight of the gloomy clouds, and, quivering with vague fears, Easter sank down from her chair to Clayton's feet, and burst into tears, as he put his arms tenderly about her.

"Has he ever treated you badly?" asked Clayton.

"No, no," she answered; "it's the whisky."

It was not alone of her father's behavior that she had been thinking. Memories were busy within her, and a thousand threads of feeling were tightening her love of home, the only home she had ever known. Now she was leaving it for a strange world of which she knew nothing, and the thought pierced her like a physical pain.

"Are we ever coming back again?" she asked with sudden fear.

"Yes, dear," answered Clayton, divining her thoughts; "whenever you wish."

After that she grew calmer, and remained quiet so long that she seemed to have fallen asleep like a tired child relieved of its fears. Leaning forward, he looked into the darkness. It was after midnight, surely. The clouds had become lighter, more luminous, and gradually the moon broke through them, lifting the pall from the valley, playing about the edge of the forest, and quivering at last on the window. As he bent back to look at the sleeping girl, the moonlight fell softly upon her face, revealing its purity of color, and touching the loosened folds of her hair, and shining through a tear-drop which had escaped from her closed lashes. How lovely the face was! How pure! How childlike with all its hidden strength! How absolute her confidence in him! How great her love! It was of her love that he thought, not

of his own; but with a new realization of her dependence upon him for happiness, his clasp tightened about her almost unconsciously. She stirred slightly, and, bending his head lower, Clayton whispered in her ear:

"Have you been asleep, dear?"

She lifted her face, and looked tenderly into his eyes, shaking her head slowly, and then, as he bent over again, she clasped her arms about his neck and strained his face to hers.

Not until the opening of the door at the stairway stirred them did they notice that the music and dancing below had ceased. The door was instantly closed again after a slight sound of scuffling, and in the moment of stillness that followed they heard Raines say calmly:

"No; you can't go up there."

A brutal oath answered him, and Easter started to her feet when she heard her father's voice terrible with passion; but Clayton held her back, and hurried down the stairway.

"Ef ye don't come away from thet door," he could hear Hicks saying, "'n' stop this meddlin', I 'll kill you 'stid o' the furriner."

As Clayton thrust the door open Raines was standing a few feet from the stairway. The drunken man was struggling in the grasp of several mountaineers, who were coaxing and dragging him across the room. About them were several other men scarcely able to stand, and behind these a crowd of shrinking women.

"Go back! Go back!" said Raines, in low, hurried tones.

But Hicks had caught sight of Clayton. For a moment he paused, glaring at him. Then, with a furious effort, he wrenched himself from the hands that held him, thrust his hand into his pocket, backing against the wall. The crowd fell away from him as a weapon was drawn and leveled with unsteady hand at Clayton. Raines sprang forward; Clayton felt his arm clutched, and a figure darted past him. There was a flash, a report, and as Raines wrenched the weapon from the mountaineer's grasp the latter was standing rigid, with horror-stricken eyes fixed upon the smoke, in which Easter's white face showed. As the smoke drifted aside, the girl was seen with both hands clasped to her breast. Then, while a silent terror held every one, she turned and with outstretched hands tottered toward Clayton; and as he caught her in his arms, a low moan broke from her lips.

SOME one hurried away for a physician, but the death-watch was over before he came.

For a long time the wounded girl lay apparently unconscious, her face white and quiet. Only when a bird chirped at the window close to the bed were her lids half raised, and as Clay-

ton pushed the shutter open and lifted her gently, she opened her eyes with a grateful look and turned her face eagerly to the cool air.

The dawn was breaking. The east was already aflame with bars of rosy light, gradually widening. Above them a single star was poised, and in the valley below great white mists were stirring from sleep. For a moment she seemed to be listlessly watching the white, shapeless things, trembling as with life, and creeping silently into wood and up glen; and then her lashes drooped wearily together.

The door opened as Clayton let her sink upon the bed, breathing as if asleep, and he turned, expecting the physician. Raines, too, rose eagerly, stopped suddenly, and shrank back with a shudder of repulsion as the figure of the wretched father crept, half crouching, within.

"Sherd!"

The girl's tone was full of gentle reproach, and so soft that it reached only Clayton's ears.

"Sherd!"

This time his name was uttered with an appeal, ever so gentle.

"Poor dad! Poor dad!" she whispered softly. Her clasp tightened suddenly on Clayton's hand; and her eyes, fastened upon his an instant, closed slowly.

A WEEK later two men left the cabin at dusk.

Half-way down the slope they came to one of the unspeakably mournful little burying-grounds wherein the mountain people rest after their narrow lives. It was unhedged, uncared for, and a few crumbling boards for headstones told the living generation where the dead were at rest. For a moment they paused to look at a spot beneath a great beech where the earth had been lately disturbed.

"It air hard ter see," said one, in a low, slow voice, "why she was taken, 'n' him left; why she should hev ter give her life for the life he took. But He knows, He knows," the mountaineer continued, with unfaltering trust; and then, after a moment's struggle to reconcile fact with faith:

"The Lord took whut he keered fer most, 'n' she was ready, 'n' he was n't."

The other made no reply, and they kept on in silence. Upon a spur of the mountain beneath which the little mining-town had sunk to quiet for the night they parted with a hand-clasp. Not till then was the silence broken.

"Thar seems ter be a penalty fer lovin' too much down hyar," said one; "'n' I reckon," he added slowly, "thet both of us hev got thet ter pay."

Turning, the speaker retraced his steps. The other kept on toward the twinkling lights.

# THE NATURE AND ELEMENTS OF POETRY.<sup>1</sup>

## VIII. THE FACULTY DIVINE.

**P**OETIC expression is that of light from a star, our straightest message from the inaccessible human soul. Critics may apply their spectrum analysis to the beam, but without such a process our sympathetic instinct tells us how fine, how rude, how rare or common, are the primal constituents from which its vibrations are derived. The heat-rays, the light, the actinic—these may be combined in ever various proportions, but to make a vivid expression they must in some proportion come together. Behind the action at their starting-place glows and pulsates a spirit of mysterious and immortal force, the "vital spark," to comprehend which were to lay hold upon divinity itself. As to the poet's share of this, Wordsworth, that inspired schoolmaster with the gift to create a soul under the ribs of pedantry, conceived his impressive title—"the faculty divine." Before approaching more closely to this radiant source, we have to touch upon one remaining element which seems most of all to excite its activity, and to which, in truth, a whole discourse might be devoted as equitably as to truth, or beauty, or imagination.

I HAVE laid stress, heretofore, upon the passion which so vivifies all true poetry that certain thinkers believe the art has no other office than to give emotion vent. And I have just said that, while poetry which is not imaginative cannot be great, the utterance which lacks passion is seldom imaginative. It may tranquilize, but it seldom exalts and thrills. Therefore, what is this quality which we recognize as passion in imaginative literature? What does Milton signify, in his masterly tractate on education, by the element of poetry which, as we have seen, he mentions last as if to emphasize it? Poetry, he says, is simple,—and so is all art at its best; it is sensuous,—and thus related to our mortal perceptions; lastly, it is passionate,—and this, I think, it must be to be genuine.

In popular usage the word "passion" is almost a synonym for love, and we hear of "poets of passion," votaries of Eros or Anteros, as the case may be. Love has a fair claim to its title of the master passion, despite the arguments made in behalf of friendship and ambition respectively, and whether supremacy

over human conduct, or its service to the artistic imagination, be the less. Almost every narrative-poem, novel, or drama, whatsoever other threads its coil may carry, seems to have love for a central strand. Love has the heart of youth in it,

—and the heart  
Giveth grace unto every art.

Love, we know, has brought about historic wars and treaties, has founded dynasties, made and unmade chiefs and cabinets, inspired men to great deeds or lured them to evil: in our own day has led more than one of its subjects to imperil the liberty of a nation, if not to deem, with Dryden's royal pair, "the world well lost." A strenuous passion indeed, and one the force of which pervades imaginative literature.

But if Milton had used the word "impassioned," his meaning would be plainer to the vulgar apprehension. Poetic passion is intensity of emotion. Absolute sincerity banishes artifice, insures earnest and natural expression; then beauty comes without effort, and the imaginative note is heard. We have the increased stress of breath, the tone, and volume, that sway the listener. You cannot fire his imagination, you cannot rouse your own, in quite cold blood. Profound emotion seems, also, to find the aptest word, the strongest utterance,—not the most voluble or spasmodic,—and to be content with it. Wordsworth speaks of "thoughts that do often lie too deep for tears," while Mill says that "the poetry of a poet is Feeling itself, using thought only as a means of expression." The truth is that passion uses the imagination to supply conceptions for its language. On the other hand, the poet, imagining situations and experiences, becomes excited through dwelling on them. But whether passion or imagination be first aroused, they speed together like the wind-sired horses of Achilles.

The mere artisan in verse, however adroit, will do well to keep within his liberties. Sometimes you find one affecting the impassioned tone. It is a dangerous test. His wings usually melt in the heat of the flame he would approach. Passion has a finer art than that of the esthete with whom beauty is the sole end. Sappho illustrated this, even among the Greeks, with

<sup>1</sup> Copyright, 1892, by Edmund Clarence Stedman.

whom art and passion were one. Keats felt that "the excellence of every art is its intensity, capable of making all disagreeables evaporate, from their being in close relations with beauty and truth." Passion rises above the sensuous, certainly above the merely sensual, or it has no staying power. I heard a wit say of a certain painting that it was "repulsive equally to the artist, the moralist, and the voluptuary." Even in love there must be something ideal, or it is soon outlawed of art. A few of Swinburne's early lyrics, usually classed as erotic, with all their rhythmic beauty, are not impassioned. His true genius, his sacred rage, break forth in measures burning with devotion to art, to knowledge, or to liberty. There is more real passion in one of the resonant "Songs before Sunrise" than in all the studiously erotic verse of the period, his own included.

The idea that poetry is uttered emotion, though now somewhat in abeyance, is on the whole modern. It was distinctive with the romantic school, until the successors of Scott and Byron allied a new and refined tenderness to beauty. The first rush had been that of splendid barbarians. It is so true that strong natures recognize the force of passion, that even Wordsworth, conscious of great moods, was led to confess that "poetry is the spontaneous outflow of powerful feelings," and saved himself by adding that it takes "its origin from emotion recollected in tranquillity." Poets do retain the impressions of rare moments, and express them at their own time. But "the passion of Wordsworth," under which title I have read an ingenious plea for it by Dr. Coan, was at its best very serene, and not of a kind to hasten dangerously his heart-beats. Like Goethe, he regarded human nature from without; furthermore, he studied by choice a single class of people, whose sensibilities were not so acute, say what you will, as those of persons wonted to varied and dramatic experiences. The highest passion of his song was inspired by inanimate nature; it was a tide of exultation and worship, the yearning of a strong spirit to be at one with the elements. Add to this his occasional notes of feeling: the pathos of love in his thought of Lucy—

But she is in her grave, and, oh,  
The difference to me!

the pathos of broken comradeship in the quatrain—

Like clouds that rake the mountain-summits,  
Or waves that own no curbing hand,  
How fast has brother followed brother  
From sunshine to the sunless land!

include also his elevated religious and patriotic moods, and we have Wordsworth's none too frequent episodes of intense expression.

All passion obtains relief by rhythmic utterance in music or speech; it is soothed like Saul in his frenzy by the minstrel harp of David. But the emotion which most usually gives life to poetry is not that of fits of passion, but, as in the verses just quoted, of the universal moods embraced in the word "feeling." Out of natural feeling, one touch of which "makes the whole world kin," come the lyrics and popular verse of all nations; it is the fountain of spontaneous song. Take the poetry of this class from Southern literatures, such as the Italian and Spanish, and you leave only their masterpieces. At first thought, it seems more passionate than our own, and certainly it is more sonorous. But Anglo-Saxon words are deep and strong, although there is a good deal of insularity in the song from "The Princess":

O tell her, Swallow, thou that knowest each,  
That bright and fierce and fickle is the South,  
And dark and true and tender is the North.

If this be so, they should wed indissolubly, for each must be the other's complement. Scottish verse is full of sentiment, often with the added force of pathos. For pure feeling we all carry in our hearts "Auld Lang Syne," "The Land o' the Leal," Motherwell's "Jeanie Morrison" and "My heid is like to rend, Willie." Robert Burns is first and always the poet of natural emotion, and his fame is a steadfast lesson to minstrels that if they wish their fellow-men to feel for and with them, they must themselves have feeling. Only from the depths of a great soul could come the stanzas of "Highland Mary" and "To Mary in Heaven." He touches chords for high and low alike in the unsurpassable "Farewell":

Had we never loved sae kindly,  
Had we never loved sae blindly,  
Never met or never parted,  
We had ne'er been broken-hearted!

His lyrics of joy, ambition, patriotism, are all virile with the feeling of a brave and strong nature.

English emotional verse is more self-conscious, and often flooded with sentimentalism. Yet Byron's fame rests upon his intensity, whether that of magnificent apostrophes, or of his personal poems, among which none is more genuine than his last lyric, written upon completing his thirty-sixth year. In the Victorian period the regard for art has covered sentiment with an aristocratic reserve, but Hood was a poet of emotion in his beautiful songs and ballads no less than in "The Bridge of Sighs."

From the middle register of emotion, poetry rises to the supreme, such as that of Shelley's "Lines to an Indian Air," or the more

spiritual ecstasy of his invocation to the West Wind:

Make me thy lyre, even as the forest is:

What if my leaves are falling like its own!

The tumult of its mighty harmonies

Will take from both a deep autumnal tone,

Sweet though in sadness. Be thou, spirit fierce,

My spirit! Be thou me, impetuous one!

Of recent English lyrical poets Mrs. Browning is one of the most impassioned. Her lips were touched with fire; her songs were magnetic with sympathy, ardor, consecration. But our women poets of the century usually have written from the heart; none more so than Emma Lazarus, whose early verse had been that of an art-pupil, and who died young—but not before she seized the harp of Judah and made it give out strains that all too briefly renewed the ancient fervor and inspiration.

Every note of emotion has its varying organs: religious feeling, for instance, whether perfectly allied with music in cloistral hymns, or expressed objectively in studies like Tennyson's "St. Agnes" and "Sir Galahad," and Elizabeth Lloyd's "Milton in his Blindness," or rising to the eloquent height of Coleridge's "Chamouni Hymn." So it is with martial songs and national hymns, from Motherwell's "Cavalier's Song," and Campbell's "Ye Mariners of England," to the Marseillaise hymn, to "My Maryland" and the "Battle Hymn of the Republic." It is the passion of Lowell's "Memorial Odes" that so lifts their rhythm and argument. With Poe, beauty was a passion, but always hovering with strange light above some haunted tomb. Emerson exhibits the intensity of joy as he listens to nature's "perfect rune." On the one side we have Poe avowing that the "tone" of the highest manifestations of beauty is one of sadness. "Beauty of whatever kind," he said, "in its supreme development, invariably excites the sensitive soul to tears." This is the key-note of our romanticism, of which there has been no more sensitive exemplar than Poe—Grecian as he was at times in his sense of form. But far more Grecian, in temper and philosophy, was Emerson, who found the poet's royal trait to be his cheerfulness, without which "no man can be a poet, for beauty is his aim. . . . Beauty, the spirit of joy and hilarity, he sheds upon the universe." What diverse interpretations, each a lesson to those who would limit the uncharted range of feeling and art! Yet it is easy to comprehend what Poe meant, and to confess that mortal joy is less intense of expression than mortal grief. And it was Emerson himself who, in his one outburst of sorrow, gave us the most impassioned of American lyrics, the "Threnody" for his lost child—his "hyacinthine boy."

This free and noble poem—even for its structural beauty, so uncommon in Emerson's work—must rank with memorable odes. But the poet's faith, thought, imagination, are all quickened by his sorrow, so that the "Threnody" is one of the most consolatory as well as melodiously impulsive elegies in the language.

Taken for all in all, Whittier, "our bard and prophet best-beloved," that purely American minstrel, so virginal and so impassioned, at once the man of peace and the poet militant, is the Sir Galahad of American song. He has read the hearts of his own people, and chanted their emotions, and powerfully affected their convictions. His lyrics of freedom and reform, in his own justified language, were "words wrung from the nation's heart, forged at white heat." Longfellow's national poems, with all their finish, cannot rival the natural art of Whittier's; they lack the glow, the earnestness, the intense characterization, of such pieces as "Randolph of Roanoke," "Ichabod," and "The Lost Occasion." The Quaker bard, besides, no less than Longfellow, is a poet of sympathy. Human feeling, derived from real life and environment, is the charm of "Snow-Bound," even more than its absolute transcript of nature. Years enough have passed since it was written for us to see that, within its range, it is not inferior to "The Deserted Village," "The Cotter's Saturday Night," and "Tam O'Shanter."

Mark Pattison justly declared that "poets of the first order" always have felt that "human action or passion" is the highest theme. These are the topics of Homer, Dante, Milton, Goethe, Hugo. Dante, while perceiving by the smiling of the stars, and by the increasing beauty and divineness of Beatrice, that she is translating him to the highest spheres, still clings to his love for the woman. Its blood-red strand connects his Paradise with earth. The Faust-Margaret legend is human to the radiant end. Rossetti's "The Blessed Damozel" idealizes the naive materialism of the cathedral ages. The motive of that prismatic ballad is the deathless human passion of the sainted maiden. Her arms make warm the bar of Heaven on which she leans, still mortal in her immortality, waiting for the soul of her lover. Such is the poetic instinct that no creature can be finer in quality, however advanced in power, than man himself; that the emotions of his soul are of the uttermost account. Rossetti was ever an impassioned poet, in whom were blended Northern and Italian types. His series of sonnets, "The House of Life," quivers with feeling. Christina Rossetti, his sister, holds her eminence not by the variety and extent of her verse, but for its emotion deep inwrought. Tennyson's career indicates that the line of advance for a poet is that of greater intensity; nevertheless,

he has furnished a typical example of the national repugnance to throwing wide the gates of that deep-set but rugged castle, an English heart. His sense of beauty and art at first was all in all, although such poems as "Locksley Hall" and "The Sisters"—such a line as that from the former,

And our spirits rushed together at the touching  
of the lips—

showed him capable of taking up the "Harp of Life." Throughout his long idyllic reign, he grew upon the whole more impassioned in thought and dramatic conception—yet the proof of this is not found in his dramas, but in portions of "In Memoriam," in powerful studies like "Lucretius" and "Rizpah," and in the second part of "Locksley Hall." Great poets confront essentials as they approach their earthly resolution.

THUS far I have referred only to the emotion of the poet's own soul, often the more intense and specific from its limits of range. The creative masters give us all the hues of life's "dome of many-colored glass," as caught from their interior points of view. What is life but the speech and action of us all, under stress of countless motives and always of that blind emotion which Schopenhauer termed the World-Will? It is at the beck of the strong invoker that these modes of feeling come arrayed for action, and not in single spies, but far more various than the passions which Collins's Muse drew around her cell. Such are the throes of Homer's personages within and without the walls of Troy. The intense and natural emotion of Priam and Achilles, of Hector and Andromache and Helen, has made them imperishable. The heroic epics have gone with their ages, and for every romantic and narrative poem we have a hundred novels; but the drama remains, with its range for the display of passion's extreme types. The keen satisfaction we take in an exhibition, not of the joy and triumph alone, but of the tragedy, the crime, the failure of lives that ape our own, is not morbid, but elevating. We know by instinct that they are right who declare all passion good *per se*; we feel that it is a good servant if a bad master, and bad only when it goes awry, and that the exhibition of its force both enhances and instructs the force within each soul of us. Again, the poet who broods on human passion and its consequent action attains his highest creative power: he rises, as we say, at each outbreak and crisis, and the actor impersonating his conception must rise accordingly, or disappoint the audience which knows that such culminations are his opportunities,

above the realistic level of a well-conceived play. More than all, and as I have suggested in a former lecture, the soul looks tranquilly on, knowing that it, no more than its prototypes, can be harmed by any mischance. "Agonies" are merely "its changes of garments." They are forms of *experience*. The soul desires *all* experiences; to touch this planetary life at all points, to drink not of triumph and delight alone; it needs must drain its portion of anguish, failure, wrong. It would set, like the nightingale, its breast against the thorn. Its greatest victory is when it is most agonized. When all is lost, when the dark tower is reached, then Childe Roland dauntless winds his blast upon the slug-horn. Its arms scattered, its armor torn away, the soul, "the victor-victim," slips from mortal encumbrance and soars freer than ever. *Victor atque victima, atque ideo victor quia victima*. This is the constant lesson of the lyrics and plays and studies of Browning, the most red-blooded and impassioned of modern dramatic poets; a wise and great master, whose imagination, if it be less strenuous than his insight and feeling, was yet sufficient to derive from history and experience more types of human passion than have been marshaled by any compeer. I have been struck by a critic's quotation of a passage from Beyle (written in 1817) which says that, after centuries of artificiality, it must be the office of the coming artist to express "states of soul"—that that is what a Michael Angelo would do with modern sculpture. In truth the potent artist, the great poet, is he who makes us realize the emotions of those who experience august extremes of fortune. For what can be of more value than intense and memorable sensations? What else make up that history which alone is worth the name of life?

The most dramatic effects are often those which indicate suppressed passion—that the hounds are ready to slip the leash. These are constantly utilized by Browning; they characterize the Puritan repression in Hawthorne's romances and Mrs. Stoddard's novels, and the weird power of Emily Brontë's "Wuthering Heights." In the drama, above all, none but a robustious periwig-pated fellow is expected to "tear a passion to tatters." Nor can dramatic heights be of frequent occurrence: they must rise like mountains from a plain to produce their effect, and even then be capped with clouds—must have something left untold. A poem at concert-pitch from first to last is ineffective. See with what relief of commonplace or humor Shakspeare sets off his supreme crises: the banter with Osric before the death of Hamlet; the potter and babble of the peasant who brings the asp to Cleopatra. In the silent arts, as in nature, the prevailing mood is equable, and

must be caught. The picture on your walls that displays nature in her ordinary mien, and not in a vehement and exceptional phase, is the one which does not weary you. But poetry, with its time-extension, has the freedom of dramatic contrasts—of tranquillity and passion according to nature's own allotment. With this brave advantage, naturalism is ignoble which restricts itself to the ordinary, and is indeed grossly untrue to our life, at times so concentrated and electric.

The ideal of dramatic intensity—that is, of *imagined feeling*—is reached when the expression is as inevitable as that of a poet's outburst under stress of personal emotion. You are conscious, for example, that one must endure a loss as irreparable as that which Cowper bemoaned, before he can realize the pathos and beauty of the monody "On the Receipt of my Mother's Picture":

Oh that those lips had language ! Life has passed  
With me but roughly since I heard thee last.

But you also feel, and as strongly, that only one who has been agonized by the final surrender, whether to violence or death, of an adored child, can fully comprehend that passionate wail of Constance bereft of Arthur:

Grief fills the room up of my absent child,  
Lies in his bed, walks up and down with me,  
Puts on his pretty looks, repeats his words,  
Remembers me of all his gracious parts,  
Stuffs out his vacant garments with his form ;  
Then have I reason to be fond of grief.

Shakspeare's dramas hold the stage, and if his stronger characters are not impersonated so frequently as of old, they are still the chief rôles of great actors, and are supported with a fitness of detail unattained before. The grand drama, then, is the most efficient form of poetry in an unideal period to conserve a taste for something imaginative and impassioned. But, with a public bred to reserve, our new plays and poems on the whole avoid extremes of feeling, which, alike in life and literature, are not "good form." What we do accept is society drama, chiefly that which turns upon the Parisian notion of life as it is. But whether the current drama, poetic or otherwise, reflects life as it is, is a question upon which I do not enter. I have referred to the lack of passion in modern poetry. The minor emotions are charmingly, if lightly, expressed. Humor, for instance, is given a play almost Catullian; and that Mirth is a feeling, if not a passion, is the lyrical justification of some of our felicitous modern song. Many of our poets realize that we have rounded a beautiful but too prolonged idyllic period; they amuse themselves with idly touching the

strings, while awaiting some new dispensation—the stimulus of a motive, the example of a leader. Emotion must be always sustained; there must be intervals of rest. But each generation desires to be moved, to be thrilled; and they are mistaken who conceive the poetic imagination to be out of date and minstrelsy a foil of the past.

As it is, we hear much talk, on the part of those observers whose business it is to record the movement of a single day, about the decline of ideality. Whenever one of the elder luminaries goes out, the cry is raised, Who will there be to take his place? What lights will be left when the constellation of which he was a star shall have vanished? The same cry has gone up from every generation in all eras. Those who utter it are like water-beetles perceiving only the ripples, comprehending little of the great waves of thought and expression, upon which we are borne along. The truth is that, alike in savagery and civilization, there never is a change from stagnation to life, from bondage to freedom, from apathy to feeling and passion, that does not beget its poets. At such a period we have the making of new names in song, as surely as deeds and fame in great wars come to men unknown before. It is true that the greatest compositions, in all the arts, are usually produced at culminating epochs of national development. But the period of that eminent group, the "elder American poets," surely has not been that of our full development. Theirs has been the first inspiring rise of the foot-hills, above which—after a stretch of mesa, or even a slight descent—range upon range are still to rise before we reach that culminating sierra-top whose height none yet can measure. Throughout this mountain-climbing, every time that a glowing and original poet appears, his art will be in vogue again.

Now, is such a poet the child of his period, or does he come as if by warrant and create an environment for himself? From the first it seemed to me a flaw in the armor of Taine, otherwise our most catholic exponent of the principles of art, that he did not allow for the irrepressibility of genius, for the historic evidence that now and then "God lets loose a man in the world." Such a man, it is true, must be of ingrained power to overcome an adverse situation; his very originality will for a long time, as in the recent cases of Wordsworth and Browning, stand in his way, even if in the end it secures for him a far more exceeding crown of glory. If the situation is ripe for him, then his course is smooth, his work is instantly recognizable. First, then, the poet is needed. He must possess, besides imaginative and emotional endowments, the special gifts

which, however cultivable, come only at birth — “the vision and the faculty divine,” and a certain strong compulsion to their exercise. But these gifts, under such compulsion, constitute what we mean by the poet’s genius.

In our age of distributed culture, it has become a matter of doubt — even among men reared upon the Shorter Catechism — whether there is any predestination and foreordination of the elect in art, literature, or action. Many deem this a superstition that has too long prevailed. That it has impressed mankind everywhere and always is a matter of record. I have much faith in a universal instinct; and I believe that I still have with me the majority even of modern realists, and that the majority is right, in refusing to discredit the gift of high and exceptional qualities to individuals predestined by heredity or otherwise, and I believe that without this gift — traditionally called *genius* — no poet has afforded notable delight and service. I know that men of genius often waive their claim; that Buffon said genius was “but long-continued patience”; that Carlyle wrote, it “means transcendent capacity for taking trouble, first of all”; that one eminent modern writer, though in a passing mood, announced: “there is no ‘genius,’ there is only the mastery which comes to natural aptitude from the hardest study of any art or science.” But these are the surmises of men whose most original work comes from them so easily that they do not recognize the value of the gift that makes it natural. They honestly lay more stress upon the merit of the hard labor which genius unconsciously drives them to undertake. I say “drives them,” and call to mind Lowell’s acute distinction: “Talent is that which is in a man’s power; genius is that in whose power a man is.” Carlyle’s whole career proves that he simply wished to recognize the office laid upon genius of taking “infinite trouble.” His prevailing tone is unmistakable: “Genius,” he says, “is the inspired gift of God.” “It is the clearer presence of God Most High in a man;” and again, “Genius, Poet, do we know what those words mean? An inspired Soul once more vouchsafed to us, direct from Nature’s own fire-heat, to see the Truth, and speak it, or do it.” His whole philosophy of sway by divine right is a genius-worship. Even Mr. Howells’s phrase, “natural aptitude,” if raised to the highest power, is a recognition of something

behind mere industry. It is what forces the hero, the artist, the poet, to be absorbed in a special office and decides his choice of it.<sup>1</sup>

The world is equipped with steadfast workers whose natural taste and courageous, strenuous labor do not lift them quite above the mediocre. The difference between these, the serviceable rank and file, and the originative leaders, is one of kind, not of degree. However admirable their skill and service in time become, they do not get far apart from impressions common to us all. We cannot dispense with their army in executive and mechanical fields of action. It is a question whether they are so essential to arts of taste and investigation; to philosophy, painting, music; to the creative arts of the novelist and poet. But with respect to these, it would be most unjust to confound them with the upstarts whose condign suppression is a desirable thing for both the public and themselves — claimants really possessed of less than ordinary sense. Such is the fool of the family who sets up for a genius; the weakling of the borough, incapable of practical work, or too lazy to follow it, but with a fondness for fine things and a knack of imitating them. Such are the gadflies of every art, pertinaciously forcing themselves upon attention, and lowering their assumed crafts in the esteem of a community.

It is wise to discriminate, also, between genius and natural fineness of taste. The latter, joined with equally natural ambition, has made many a life unhappy that had peculiar opportunities for delight. For surely it is a precious thing to discern and enjoy the beautiful. Taste in art, in selection, in conduct, is the charm that makes for true aristocracy, a gift unspoiled but rather advanced by gentle breeding, a grace in man, and adorable in woman; it is something to rest content with, the happier inasmuch as you add to the happiness of others. It is the nimbus of many a household, beautifying the speech and bearing of the members, who, if they are wise, realize that its chief compensation is a more tranquil study and possession of the beautiful than are permitted to those who create it. Hephaistos, the grim, sooty, halt artificer of all things fair, found small comfort even in the possession of Aphrodite, the goddess who inspired him. The secret of happiness, for a refined nature, is a just measure of limitations. Taste is not always original, cre-

<sup>1</sup> Nothing of late has seemed apter than a criticism of the “Saturday Review” upon certain outgivings of the academicians, Sir Frederick Leighton and Sir John Millais, quite in the line of the industrial theory from which the present writer is dissenting. The reviewer, commenting upon their didactic paradoxes, asserts that all the truth which is in them amounts to just this: “That the intuitive perceptions and rapidity of combination which constitute genius, whether in action or spec-

ulation, in scientific discovery or inventive art or imaginative creation, open out so many new problems and ideas as to involve in their adjustment and development the most arduous labor and the most unwearied patience. But without the primal perception the labor will be vanity and the patience akin to despair. Perhaps it is important to keep in mind that labor without the appropriate capacity is even more fruitless than aptitude without industry.”

ative. There are no more pathetic lives than the lives of those who know and love the beautiful, and who surrender its enjoyment in a vain struggle to produce it. Their failures react upon finely sensitive natures, and often end in sadness, even misanthropy, and disillusionment when the best of life is over.

Men of talent and experience do learn to concentrate their powers on certain occasions, and surprise us with strokes like those of genius. That is where they write "better than they can," as our Autocrat so cleverly has put it. But such efforts are exhausting and briefly sustained. I know it is said that genius also expires when its work is done; but who is to measure its reservoir of force or to gage the unseen current that replenishes it?

That there is something which comes without effort, yet impels its possessor to heroic labor, is immemorably verified.<sup>1</sup> It whispered melodies to Mozart almost in his boyhood, made him a composer at five—at seven the author of an opus, four sonatas for piano and violin; and it so drew him on to victorious industry, that he asserted in after life: "No one has taken such pains with the study of composition as I!" Dickens declared that he did not invent his work: "I see it," he said, "and write it down."<sup>2</sup> Sidney Lanier, in nervous crises, would seem to hear rich music. It was an inherited gift. Thus equipped with a rhythmical sense beyond that of other poets, he turned to poetry as to the supreme art. Now, the finer and more complex the gift, the longer exercise is needful for its full mastery. He strove to make poetry do what painting has done better, and to make it do what only music hitherto has done. If he could have lived three lives, he would have adjusted the relations of these arts as far as possible to his own satisfaction. I regard his work, striking as it is, as merely tentative from his own point of view. It was as if a discoverer should sail far enough to meet the floating rock-weed, the strayed birds, the changed skies, that betoken land ahead; should even catch a breath of fragrance wafted from outlying isles, and then find his bark sinking in the waves before he could have sight of the promised continent.

In our day, when talent is so highly skilled and industry so habitual, people detect the genius of a poet or tale-writer through its originality, perhaps first of all. It has a different note, even in the formative and imitative

period, and it soon has a different message—perhaps one from a new field. The note is its style; the message involves an exhibition of creative power. Genius does not borrow its main conceptions. As I have said, it reveals a more or less populous world of which it is the maker and showman. Here it rises above taste, furnishing new conditions, to the study of which taste may profitably apply itself. It is neither passion nor imagination, but it takes on the one and makes a language of the other. Genius, of the universal kind, is never greater than in imparting the highest interest to good and ordinary and admirable characters; while a limited faculty can design only vicious or eccentric personages effectively, depending on their dramatic villainy or their grotesqueness for a hold upon our interest. Véron has pointed out this inferiority of Balzac and Dickens to Shakspeare and Molière—and he might have added, to Thackeray also. In another way the genius of many poets is limited—that of Rossetti, of Poe, for example—poets of few, though striking, tones and of isolated temperaments. Genius of the more universal type is marked by a sound and healthy judgment. You may dismiss with small respect the notion of Fairfield, Lombroso, and their like, that genius is the symptom of neurotic disorder—that all who exhibit it are more or less mad. This generalization involves a misconception of the term; they apply it to the abnormal excess, the morbid action, of a special faculty, while true genius consists in the creative gift of one or more faculties at the highest, sustained by the sane coöperation of the possessor's other physical and mental endowments. Again, what we term common sense is the genius of man as a race, the best of sense because the least ratiocinative. Nearly every man has thus a spark of genius in the conduct of life. A just balance between instinct, or understanding, and reason, or intellectual method, is true wisdom. It requires years for a man of constructive talent—a writer who forms his plans in advance—for such a man to learn to be flexible, to be obedient to his sudden intuitions and to modify his design accordingly. You will usually do well to follow a clue that comes to you in the heat of work—in fact, to lay aside for the moment the part that you had designed to complete at once, and to lay hold of the new matter before that escapes you. The old oracle, follow thy genius, holds good

<sup>1</sup> The cases of Mozart and Dickens, with others equally notable, were cited by the writer in an extended paper on Genius, which was published several years ago.

<sup>2</sup> Hartmann's scientific definition, which I cited in a former lecture,—Genius is the activity and efflux of the intellect freed from the domination of the conscious Will,—finds its counterpart in the statement by

F. W. H. Myers, concerning the action of the "Subliminal Consciousness." This, Mr. Myers says, has to do with "the initiation and control of organic processes, which the conscious will cannot reach. . . . Perhaps we seldom give the name of genius to any piece of work into which some uprush of subliminal faculty has not entered." [See the "Journal of the Society for Psychological Research," Feb., 1892.]

in every walk of life. Everything, then, goes to show that genius is that force of the soul which works at its own seemingly capricious will and season, and without conscious effort; that its utterances declare what is learned by spiritual and involuntary discovery :

Vainly, O burning Poets !  
Ye wait for his inspiration,  
Even as kings of old  
Stood by Apollo's gates.

*Hasten back, he will say, hasten back  
To your provinces far away !  
There, at my own good time,  
Will I send my answer to you.*

YES, the spontaneity of conception, which alone gives worth to poetry, is a kind of revelation—the imagery of what genius perceives by Insight. This sense has little to do with reason and induction; it is the inward light of the Quaker, the *a priori* guess of the scientist, the prophetic vision of the poet, the mystic, the seer. If it be direct vision, it should be incontrovertible. In occult tradition the higher angels, types of absolute spirit, were thought to know all things by this pure illumination :

There, on bright hovering wings that tire  
Never, they rest them mute,  
Nor of far journeys have desire,  
Nor of the deathless fruit;  
For in and through each angel soul  
All waves of life and knowledge roll,  
Even as to nadir streams the fire  
Of their torches resolute.

While this is a bit of Preraphaelite mosaic, it is not too much to say of the essentially poetic soul that at times it becomes, in Henry More's language,

One orb of sense, all eye, all airy ear ;

that it seems to have bathed, like Ayesha, in central and eternal flame; or, after some pre-existence, to have undergone the lustration to which, in the sixth *Æneid*, we find the beclouded spirits subjected :

Donec longa dies, perfecto temporis orbe,  
Concretam exemit labem, purumque relinquit  
Aetherium sensum atque aurai simplicis ignem.<sup>1</sup>

At such times its conclusions are as much more infallible than those worked out by logic as is the offhand pistol-shot of the expert, whose weapon has become a part of his hand, than the sight taken along the barrel. It makes the leopard's leap, without reflection and without

miss. I think it was Leigh Hunt who pointed out that feeling rarely makes the blunders which thought makes. Applied to life, we know that woman's intuition is often wiser than man's wit.

The clearness of the poet's or artist's vision is so much beyond his skill to reproduce it, and so increases with each advance, that he never quite contents himself with his work. Hence the ceaseless unrest and dissatisfaction of the best workman. His ideal is constantly out of reach—a "lithe, perpetual escape."

From the poet's inadequate attempts at expression countless myths and faulty statements have originated. Still, he keeps in the van of discovery, and has been prophetic in almost every kind of knowledge,—evolution not expected,—and from time immemorial in affairs that constitute history. This gave rise, from the first, to a belief in the direct inspiration of genius. Insight derives, indeed, the force of inspiration from the sense that a mandate of utterance is laid upon it. To the ancients this seemed the audible command of deity. "The word of the Lord came unto me, saying,"—"Thus saith the Lord unto me,"—"So the spirit lifted me up and took me away, and I went in bitterness, in the heat of my spirit, but the hand of the Lord was strong upon me,"—such were the avowals of one of the greatest poets of all time. The vision of Ezekiel and the compulsion to declare it have been the inspiration of the prophetic bard, of the impassioned lyric poet, almost to our own day. His time has passed. We cannot have, we do not need, another Ezekiel, another Dante or Milton. Hugo, the last Vates, was the most self-conscious, and his own deity. A vision of the wisdom and beauty of art has inspired much of the superior poetry of recent times. A few prophetic utterances have been heard, evoked in some struggle of humanity, some battle for liberty of belief or nationality or conduct. Yet I doubt not that, whenever a great cause is in progress,—before its culminating triumph, rather than after,—it will have its impassioned and heroic minstrelsy. The occasion will seek out and inspire its poet.

BUT he must believe in his prophecy, and as something greater than himself, though indomitably believing in himself as the one appointed to declare it. Reflecting upon the lack of originality, of power, of what we may consider tokens of inspiration, in so much of our most beautiful latter-day song, I suspect that it is not due alone to the diversion of effort in many new fields of action and expression, but also to a general doubt of the force and import of this chief art of expression—even to the modern poet's own distrust in its significance. The

<sup>1</sup> Till Time's great cycle of long years complete  
Clears the fixed taint, and leaves the ethereal sense  
Pure, a bright flame of unmixed heavenly air.

higher his gift and training, the more he seems affected by the pleasant cynicism which renders him afraid, above all, of taking himself and his craft "too seriously." This phrase itself is the kind of chaff which he most dreads to incur. Now, I have just spoken of the wisdom of recognizing one's limitations, but if one has proved that he has a rare poetic gift, I think that he scarcely can take it and himself too seriously. The poets of our language and time who have gained the most distinction—such as Tennyson, Browning, Longfellow, Arnold, Emerson—have taken themselves very seriously indeed; have refused to go after strange gods, and have done little but to make poetry or to consider matters demanding the higher exercise of thought and ideality. Doubtless poets are born nowadays as heretofore, though nature out of her "fifty seeds" may elect to bring not even "one to bear." But some who exhibit the most command of their art, and in truth a genuine faculty, are very shy of venturing beyond the grace and humor and tenderness of holiday song.

I think that such a condition might be expected to exist during the unsettled stage of conviction now affecting our purpose and imagination. There is no lack of desire for a motive, but an honest lack of motive,—a questioning whether anything is worth while,—a vague envy, perhaps, of the superb optimism of our scientific brethren, to whom the material world is unveiling its splendors as never before, and to whom, as they progress so steadfastly, everything seems worth while.

I remember an impressive lyric, perhaps the finest thing by a certain American writer. Its title, "What is the Use?" was also the burden of his song. He took his own refrain so much to heart that, although he still lives according to its philosophy, there are only a few of us who pay meet honor to him as a poet.

Distinction ever has been achieved through some form of faith, and even the lesser poets have won their respective measures of success, other things being equal, in proportion to their amount of trust in certain convictions as to their art, themselves, and "the use of it all." The serene forms of faith in deity, justice, nationality, religion, human nature, which have characterized men of the highest rank, are familiar to you. Such faiths have been an instinct with sovereign natures, from the Hebraic sense of a sublime Presence to the polemic belief of Bunyan and Milton. Homer cheerfully recognizes the high gods as the inspirers and regulators of all human action. Dante's faith in the ultimate union of perfect beauty and perfect holiness was intense, and his conviction in the doom of the ignoble was so absolute that he felt himself commissioned

to pronounce and execute it. Shakspeare made no question of the divinity that doth hedge a king; he believed in institutions, in sovereignty, in the English race. His tranquil acceptance of the existing order of things had no later parallel until the century of Goethe and Emerson and Browning. Byron and Shelley invoked political and religious liberty, and believed in their own crusade against Philistia. Hugo and his band were leaders in a lifelong cause; they carried a banner with "Death to tradition" upon it. The underlying motive of all strenuous and enthusiastic movement, in art or poetry, is faith. Gautier and Musset concerned themselves with beauty and romantic passion; Clough and Arnold, with philosophy and feeling; all were poets and knights-errant according to their respective tempers and nationalities. And so we might go on indefinitely, without invalidating the statement that some kind of faith, with its resulting purpose, has engendered all poetry that is noteworthy for beauty or power. True art, of every class, thrives in an affirmative and motive-breeding atmosphere. It is not the product of cynicism, pessimism, or hopeless doubt. I do not mean "the honest doubt" which Tennyson sets above "half the creeds." The insatiate quest for light is nobler than a satisfied possession of the light we have. The scientific unsettlement of tradition is building up a faith that we are obtaining a new revelation, or, at least, opening our eyes to a continuous one.

But without surmising what stimulants to imaginative expression may be afforded hereafter, let me refer to a single illustration of the creative faith of the poet. For centuries all that was great in the art and poetry of Christendom grew out of that faith. What seems to me its most poetic, as well as most enduring, written product, is not, as you might suppose, the masterpiece of a single mind,—the "Divina Commedia," for instance,—but the outcome of centuries, the expression of many human souls, even of various peoples and races. Upon its literary and constructive side, I regard the venerable Liturgy of the historic Christian Church as one of the few world-poems, the poems universal. I care not which of its rituals you follow, the Oriental, the Alexandrian, the Latin, or the Anglican. The latter, that of an Episcopal Prayer-Book, is a version familiar to you of what seems to me the most wonderful symphonic idealization of human faith,—certainly the most inclusive, blending in harmonic succession all the cries and longings and laudations of the universal human heart invoking a paternal Creator.

I am not considering here this Liturgy as divine, though much of it is derived from what multitudes accept for revelation. I have in mind

its human quality; the mystic tide of human hope, imagination, prayer, sorrows, and passionate expression, upon which it bears the worshiper along, and wherewith it has sustained men's souls with conceptions of deity and immortality, throughout hundreds, yes, thousands, of undoubting years. The Orient and Occident have enriched it with their finest and strongest utterances, have worked it over and over, have stricken from it what was against the consistency of its import and beauty. It has been a growth, an exhalation, an apocalyptic cloud arisen "with the prayers of the saints" from climes of the Hebrew, the Greek, the Roman, the Goth, to spread in time over half the world. It is the voice of human brotherhood, the blended voice of rich and poor, old and young, the wise and the simple, the statesman and the clown; the brotherhood of an age which, knowing little, comprehending little, could have no refuge save trust in the oracles through which a just and merciful Protector, a pervading Spirit, a living Mediator and Consoler, had been revealed. This being its nature, and as the crowning masterpiece of faith, you find that in various and constructive beauty—as a work of poetic art—it is unparalleled. It is lyrical from first to last with perfect and melodious forms of human speech. Its chants and anthems, its songs of praise and hope and sorrow, have allied to themselves impressive music from the originative and immemorial past, and the entralling strains of its inheritors. Its prayers are not only for all sorts and conditions of men, but for every stress of life which mankind must feel in common—in the household, or isolated, or in tribal and national effort, and in calamity and repentance and thanksgiving. Its wisdom is forever old and perpetually new; its calendar celebrates all seasons of the rolling year; its narrative is of the simplest, the most pathetic, the most rapturous, and most ennobling life the world has known. There is no malefactor so wretched, no just man so perfect, as not to find his hope, his consolation, his lesson, in this poem of poems. I have called it lyrical; it is dramatic in structure and effect; it is an epic of the age of faith; but in fact, as a piece of inclusive literature, it has no counterpart, and can have no successor. Time and again some organization for worship and instruction, building its foundations upon reason rather than on faith, has tried to form some ritual of which it felt the need. But such a poem of earth and heaven is not to be made deliberately. The sincere agnostic must be content with his not inglorious isolation; he must barter the rapture and beauty and hope of such a liturgy for *his* faith in something different, something compensatory, perchance a future and still more world-wide brotherhood of men.

UNTIL this new faith, or some fresh interpretation of past belief, becomes vital in action, becomes more operative, the highest flight of poetry will be timidly essayed. The songs of those who are crying, "They have taken away my Lord, and I know not where they have laid him!" will be little else than tenebræ—cries out of the darkness, impassioned, it may be, but hardly forceful or creative. I have spoken of Arnold and Clough, the conspicuously honest, noble, intellectual poets of the transition period. Just as far as their faith extended, their verse rests firmly in art and beauty, love, and nobility of purpose. But much of it comes from troubled hearts; its limits are indicated by a spirit of unrest—limits which Arnold was too sure and fine a self-critic not to perceive; so that, after he had reached them,—which was not until he had given us enduring verse, and shown how elevated was his gift,—he ceased to sing, and set himself resolutely to face the causes of his unrest, and to hasten, through his prose investigations, the movement toward some new dawn of knowledge-brightened faith.

A few verses from his "Dover Beach" are in the key of several of his most touching lyrics,—in the varying measure so peculiarly his own,—utterances of a feeling which in the end seems to have led him to forego his career as a poet: "The sea of faith," he plains,

Was once, too, at the full, and round earth's shore  
Lay like the folds of a bright girdle fur'd.  
But now I only hear  
Its melancholy, long, withdrawing roar,  
Retreating, to the breath  
Of the night-wind, down the vast edges drear  
And naked shingles of the world.

Ah, love, let us be true  
To one another! for the world, which seems  
To lie before us like a land of dreams,  
So various, so beautiful, so new,  
Hath really neither joy, nor love, nor light,  
Nor certitude, nor peace, nor help for pain;  
And we are here as on a darkling plain  
Swept with confused alarms of struggle and flight,  
Where ignorant armies clash by night.

Doubtless Arnold's reserve intensified this sadness. Clough equally felt the perturbed spirit of his time; but he had a refuge in a bracing zest for life and nature, which so often made the world seem good to him, and not designed for naught.

In time our poets will acquire, with the new learning and the more humane and critical theology, the health and optimism in which a noteworthy art must originate if at all. As for the new learning—

Say, has the iris of the murmuring shell  
A charm the less because we know full well

Sweet Nature's trick? Is Music's dying fall  
 Less finely blent with strains antiphonal  
 Because within a harp's quick vibratings  
 We count the tremor of the spirit's wings?  
 There is a path by Science yet untrod  
 Where with closed eyes we walk to find out God.  
 Still, still, the unattained ideal lures,  
 The spell evades, the splendor yet endures;  
 False sang the poet,—there is no good in rest,  
 And Truth still leads us to a deeper quest.

For one, I believe that the best age of imaginative production is not past; that poetry is to retain, as of old, its literary import, and from time to time to prove itself a force in national life; that the Concord optimist and poet was sane in declaring that "the arts, as we know them, are but initial," that "sooner or later that which is now life shall be poetry, and every fair and manly trait shall add a richer strain to the song."

AND NOW, after all that has been said in our consideration of the nature of poetry, and although this has been restricted closely to its primal elements, I am sensible of having merely touched upon an inexhaustible theme; that my comments have been only "words along the way." Meanwhile the press teems with criticism, our time is alert with debate in countless private and public assemblies re-

specting almost every verse of all renowned poets, ancient or contemporary; texts and editions, even if relatively less in number, compared with the varied mass of publications, are multiplied as never before, and readers—say what you may—are tenfold as many as in the prime of the elder American minstrels. The study of poetry has stimulated other literary researches. Yet the best thing that I or any one can say to you under these conditions is that a breath of true poetry is worth a breeze of comment; that one must in the end make his own acquaintance with its examples and form his judgment of them. Read the best; not the imitations of imitations. Each of you will find that with which he himself is most in touch, and therewith a motive and a legend—*petere altiora*. The poet's verse is more than all the learned scholia upon it. He makes it by direct warrant; he produces, and we stand by and often too complacently measure his productions. In no wise can I forget that we are regarding even the lowliest poets from our still lower station; we are like earth-dwellers viewing, comparing, mapping out the stars. Whatsoever their shortcomings, their gift is their own; they bring music and delight and inspiration. A singer may fail in this or that, but when he dies the charm of his distinctive voice is gone forever.

*Edmund Clarence Stedman.*

## PIONEER PACKHORSES IN ALASKA.

WITH PICTURES FROM SKETCHES AND PHOTOGRAPHS BY THE AUTHOR.

### II. THE RETURN TO THE COAST.

**I**N summer, when vales and hill-sides are rid of winter snows, and ice no longer spans the lakes and streams, central Alaska looks almost tropical. Then Neska-ta-heen receives most bounteous care from nature: an abundance of salmon stems the Alseck current and passes the very doors of the Indian huts; the land abounds in wild berries; and the native hunter, who knows the haunt of every beast, can rely on finding game. But other bands of the Goonennar, or Stick, nation, living around the northern lakes I-she-ik and Hootchy-Eye, have no such plenteous supply; so when winter is gone they take the trail and move to this southern settlement, and there recuperate on the fatted fish. At the time of our visit to Neska-ta-heen there was already a crowd of these people here, all busy plying

the gaff among the salmon. Some of these men were willing to engage with us as guides, but the chief and the medicine-man, Shah Shah, jealous that strangers should earn the rich pay we offered, forbade their northern friends to accompany us. The medicine-man was our most influential opponent. Reputed to possess supernatural power, his word was law; the credulous natives, wanting in ambition and pluck, inherit a fear and respect for this expeller of evil spirits and general wonder-worker. They assured us they were willing to enter our service, but they dared not risk the anger of Shah Shah, who had threatened, should they disobey him, to surround their future lives with a catalogue of dire calamities, and to visit upon all members of their families sickness, accident, and death.

To our faces the medicine-man and the old chief, Warsaine, feigned geniality itself; we,

however, were not to be gulled by their dissimulation, but warned them that we were aware of their conspiracies. Assuming a great deal of dignity and force, we informed them that if they continued to hinder us and to thwart our progress we would put them in irons and take them to the coast. This was hardly a modest oration, considering our feeble strength. Being convinced at last that no one would accompany us, we determined to start out alone. We should have been absolutely at the mercy of these people without our horses; but with our own transport, and the old scribbled chart crudely penciled by the natives themselves, aided by compass and sextant, we concluded that we had the means to make the trip we had planned.

As we saddled and made ready for a start, the whole crowd squatted in a ring, and watched us sullenly. The medicine-man had a self-satisfied grin on his face; he imagined that because we were denied a pilot we would give in at the last moment, and alter our route to some district with which he was acquainted, so as to have the privilege of his guidance and society at \$2.50 a day. When we had completed saddling, without exchanging a word with these Indians we led our horses out through an astonished and discontented throng, and threaded our way along the trail which zigzags at first up a thickly wooded hill overlooking the settlement. Upon arriving on the summit, the path ran through forests of spruce, tamarack, and cottonwood. In exposed positions the wind had swept down acres and acres of timber, and piled it in tangled heaps across the path, rendering travel extremely tedious; but we gradually left these higher lands, ascended the mountain-slopes, and, after tramping along the shores of a small lake, continued our course over an extensive valley, which, though in places boggy, nourished everywhere a luxuriant crop of grass.

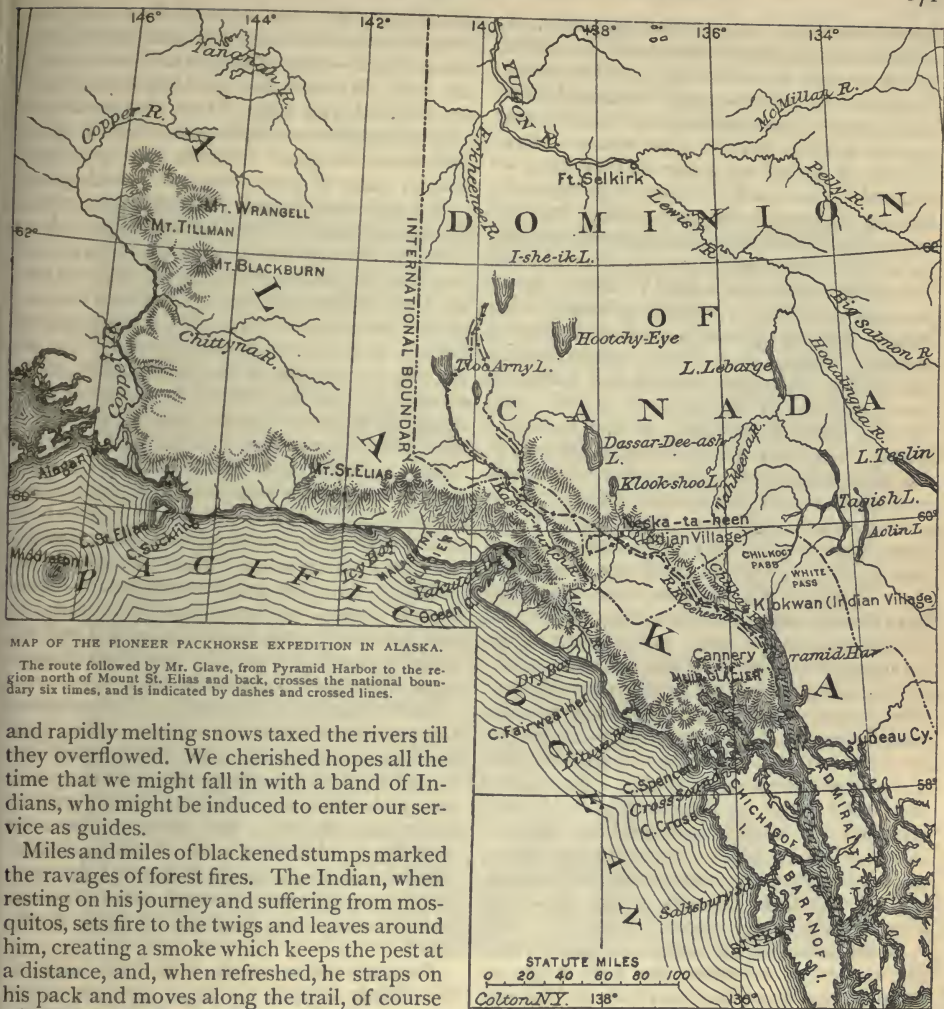

Over intricate parts of the land the Indians follow a beaten track, though they make no decided ways when crossing an open country; but as most of their conveying is done in winter on snow-shoes and with sledges, the trails through this land are extremely difficult to find anywhere.

When the natives, like so many little children, sprawled on the ground, and clumsily penciled out the position of mountains and lakes, they were utterly unconscious of the aid they rendered us. John Dalton's ability as an efficient backwoodsman and his wonderful knowledge of trails proved most serviceable to us at this season. When once he had traveled through a land he could always go over the road again, no matter how long or intricate it might be. This faculty of an experienced scout resembled some-

what the talent of a gifted musician who hears a new piece only once, and then repeats the whole without difficulty, note for note. Such men as Dalton have memories peculiarly sensitive to matters of locality. Each scene along the trail is impressed upon the mind. Lakes, hills, cañons, and points of timber rudely mark the direction, and peculiarities of stones or trees serve to define the path. When following a trail he has previously known, if by accident he leaves it, he is at once made aware of it by the changed signs along the road, which create discord with those stored in his memory. But the presence of an expert local guide would have been of the utmost service to us at this time, in saving us the time and trouble of searching out the trail, as we were hunting about sometimes for hours looking for some sign to suggest the way, until the discovery of an old camp-fire, a few wood shavings, or the print of a moccasin, would give a clue to the trail.

Everywhere we found convenient camping-places, with good water and plenty of feed for our horses, which, although incessantly worried by mosquitos and other flies, remained in good condition. We nursed the little band of horses with the greatest care, attended at once to any soreness or lameness, and loaded very lightly any animal at all unwell. We used them simply for packing our belongings; each of us took charge of two of them, which were led tied one behind the other. Through this wild land the management of four horses proved ample employment for us, combined with our other duties, which consisted of striking camp in the morning, loading up the pack-bags, and saddling up, searching out the trail, cutting roads through timber lands, and at night pitching tent, unharnessing, stacking away supplies, cooking, and maintaining a constant lookout for our horses.

For the first two days after leaving Neska-teen we followed an immense valley stretching to the northwest, and roughly furrowing a pass through the towering uplands flanking it on each side. Everywhere the land was clothed with luxuriant vegetation. Meadows of bluetop, redtop, and bunch-grass delicately tinted with wild flowers are interlaid with forests of evergreens, which reach down from the mountain-slopes and spread over the land in darkened patches, the whole valley being richly watered by chains of lakes and streams. But the ways are intricate and difficult. In places we had to chop a passage for our packhorses through forests of spruce and tamarack, and many of the pastures were only sticky quagmires. Our advance brought us face to face with deep ravines which could be passed only by climbing down their treacherous banks,

MAP OF THE PIONEER PACKHORSE EXPEDITION IN ALASKA.  
 The route followed by Mr. Glave, from Pyramid Harbor to the region north of Mount St. Elias and back, crosses the national boundary six times, and is indicated by dashes and crossed lines.

and rapidly melting snows taxed the rivers till they overflowed. We cherished hopes all the time that we might fall in with a band of Indians, who might be induced to enter our service as guides.

Miles and miles of blackened stumps marked the ravages of forest fires. The Indian, when resting on his journey and suffering from mosquitos, sets fire to the twigs and leaves around him, creating a smoke which keeps the pest at a distance, and, when refreshed, he straps on his pack and moves along the trail, of course without extinguishing his fire; when announcing his approach to friends at a distance, he sets fire to a half-dead spruce- or tamarack-tree, and the column of thick, black smoke is the signal, to be acknowledged in the same manner by those who see it, so as to direct the traveler to their camping-grounds. In the summer everything is crisp and dry, and the timber is saturated with turpentine. The trees left to smolder are fanned into flame by the slightest breeze; the flames creep among the resinous trees, and spread till whole forests are destroyed. These forest fires and the mosquitos account for the scarcity of game. Over the vast untraveled region that we visited, there was a remarkable scarcity of wild animals. We saw only a few ground-squirrels and some grouse and ptarmigan. The Indians say that all the larger animals retreat in summer to the hilltops, where, ex-

posed to a constant breeze, they are free from the torments of insects.

As we penetrated farther into the interior, the climate grew milder and the vegetation more prolific, and the mountains appeared to be in groups and short ranges overshadowing immense, well-watered valleys. On the third day a break in the mountains disclosed to the left of us a crescent of whitened heights with steep wooded slopes reaching abruptly down to the shores of a big lake, and valleys stretched away to the north and south. The mountain-pass that we traversed was 6000 feet above sea-level, but the ascent and descent were gradual, and, following a cañon-bottom, we soon emerged again into open valley lands.

In crossing one of the many swamps that spanned the valley from hill to hill, two of our

horses were for a time in serious jeopardy. An extensive grass plain stretched out ahead of us, which seemed at first to offer good traveling; but the land proved thoroughly saturated, and at every step our horses sank to their bellies in slush and black mud. Rather than return and run the risk of finding no better way to cross, we decided to push on in the hope of soon passing beyond the marsh, but our advance only increased the difficulties. In one place the ground we walked on was only a muddy cake of earth and roots floating on a pool of slush. As we plunged over this, it sagged in beneath our weight, and the treacherous crust of floating meadow, rocked into slimy, grassy waves, gaped with a hideous opening, and before we could escape, our two trail-horses, Billy and Bronco, were floundering in the darkened slush. To render assistance was difficult, as the poor frightened brutes threw themselves from side to side; but we succeeded at last in quieting them, and held their heads above water while we relieved them of their heavy packs. We then led our other two horses to a place of safety. On one side of the pool that threatened to rob us of our best animals we found a solid bank, upon which we lifted the fore legs of the submerged animals; then with a long lash-rope tied around their necks and attached to our other horses on comparatively solid ground, we hauled them by sheer force from their dangerous predicament. It was two hours before we had gained their release from the icy pool, and they stood in safety, trembling violently with fear and cold. Both Dalton and I had tumbled in several times while controlling and aiding our horses, and we were thoroughly benumbed; but another hour through greasy slush and mire brought us again to dry land.

At our camp for the night on a grassy knoll, the mosquitos and other flies were in greater numbers and more ravenous than we had ever previously experienced them. The whole insect world seemed to hail our arrival with the same relish that reservation Indians welcome Government rations. Their attacks were fierce and incessant; our poor brutes, tortured into a frenzy, though hobbled, stampeded back, and sought escape from the torment by sinking into the swamp through which we had labored only a few hours before. The next morning, however, afforded us a delightful rest, for a stiff breeze from the southward swept the air clear of the pests, and granted man and horse a short respite. When plagued by flies, our leader, who wore a brass bell, would create a continual tinkling, but when unmolested, the band would seek a soft patch of grass and go soundly to sleep, profiting by the unusual lull.

A thorough search throughout the district rewarded us with no clue to a direct course.

We found only a few signs left by roving hunters,—here and there a rough branch shelter and camp debris,—but no beaten trail ran through the land. We were in a most interesting country, studded with lakes, rivers, and mountains absolutely unknown to the outside world. Time had worn the giant mounds into grotesque shapes, some of them resembling castle ruins.

We were now about seventy miles away from Neska-ta-heen, but we felt the want of a guide so seriously that we decided that one of us should return to the village and again endeavor to persuade an Indian to join us. When we left, many of the natives were away, but were expected back in a few days; among the whole lot, we argued, there might be one in a better frame of mind. Dalton was elected to make this trip; his superior knowledge of trails would enable him to make better time. We decided, however, to shift our camp before he started, for our present position was a veritable stronghold of the insect world. All kinds of tormenting flies hovered around in myriads night and day; they got into our eyes, ears, and noses. We could pass judgment upon the aggravating circumstances only by mental notice; when we ventured to give a strongly worded opinion on this subject, the flies, ever on the alert for new fields of operation, would sail into our mouths.

Three hours' tramp brought us to a splendid pasture, where I decided to camp during Dalton's absence. To the southward, mountains buried in perpetual snows formed a strong contrast with the land around us, where violets, forget-me-nots, wild roses, daisies, buttercups, snowdrops, bluebells, and dwarf sunflowers crouched in mossy banks and tinted the meadows in varied hue. We were not a little surprised to find some bumblebees' honey at this place.

Dalton's return on the little black mare to the village caused no small amount of excitement; he feigned that he had come to get some tools which he had left in the chief's hut, and broached the subject of a guide only incidentally; but finally an offer of \$2.50 a day induced an Indian to start. He was a great powerful fellow, over six feet in height, but it was soon apparent that our mode of travel would not suit his ideas of serving the white man in ease and comfort. When a native is working on his own account he will stagger along the trail with 150 pounds, but when in the employ of the white man, though he eats as much beans and bacon as should satisfy three men, his frame, so poorly nourished, utterly collapses; he cannot even bear the weight of his own blankets. Half the way on the return journey the Indian guide was so fatigued that he rode the mare, and Dalton walked ahead and led her over the trail; and upon their

arrival at the camp from which my partner had started, the copper-colored individual complained sorrowfully of his deplorable fate. "Ee sharn hut," he said, which means, "I am to be pitied." "Too woo oo nook" ("I am very ill"), he mumbled in a half-crying voice, and tenderly touched his head, chest, arms,

south to trade off their winter furs with the coast Indians, and were returning home with weighty packs of blankets, powder, and shot. Their arrival was most opportune for our plans. We found they were bound over the same trail as ourselves, and we had no difficulty in persuading them to travel in company with us. Each

A ROCKY STRETCH OF TRAIL OVERLOOKING THE KASKAR WURLCH RIVER.

and knees to signify that the terrible hardships he had undergone had racked his whole body. Obtaining no consolation from us on that score, he attempted to conjure up other grievances for our sympathetic notice. He said again, "Ee sharn hut" ("I am to be pitied"); "hut-klake duish, klake duik" ("I have only one mother and one father"). We felt sure that these sorrowful explanations formed the preliminary to some decisive action, and we were not at all surprised to wake up next morning and to find that he had returned to his lonely parents. Such are the annoyances attendant upon a pioneer journey. Once more we saddled our little band of horses and plodded along alone, feeling decidedly disheartened. But two days after this, good fortune came to our aid: two Indians from Lake Hootchy-Eye came into camp. They had been down

party would equally profit by the combination. In consideration of their showing the way and helping us to cut roads through the timber-lands, we agreed to carry their heavy packs on our horses. The old man, Nanchay by name, was carrying about eighty pounds, and his son Tsook had a load weighing about fifty pounds. To be relieved of these burdens was a great benefit to them, and our proposal was at once accepted. The additional weight on our horses made but little difference, as our pack-saddles were rapidly getting lighter as the season advanced. The presence of these Indians was a great privilege, for the conditions under which we obtained their services afforded them no means of deceiving or humbugging us in any way. They were homeward bound and under no pay from us, so to cause unnecessary delay would be no benefit whatever to them. With

CROSSING THE KASKAR WURLCH ON A RAFT.

old Nanchay and his son as guides, we made splendid headway. They were well acquainted with the lay of the land, and they were anxious to reach their destination, as the season's hunting had begun.

Twenty-five miles' traveling over grass-lands and thickly wooded foot-hills brought us to the shores of the Kaskar Wurlch River, a tributary of the Alseck, which enters the Pacific Ocean eighty miles to the eastward of Yakutat. We were now again in the vicinity of the ice-fields reaching northward from the Mount St. Elias range; a bitterly cold wind kept us close round the camp-fire till "turning-in" time, when a goodly pile of blankets felt very comfortable. The next morning all our belongings were stiffened with frost, and the ice-coated logs, handled with benumbed hands, offered no speedy prospect of breakfast, and our boots could not be worn till we had a fire to thaw them. "Roughing it," in the true sense of the expression, is a most cheerless undertaking, to my mind, commendable only as a necessity. During nine years of travel in wild and unfrequented places, my lodgings and board have been strangely varied; but when I can, I like

to have a comfortable room and to summon my breakfast by electric button.

Our further advance northward obliged us to cross the waters of the Kaskar Wurlch, a deep stream about a quarter of a mile wide, with a five-knot current; scattered around the rocky shores we found several big logs, which we towed together into shallow water with our horses, then lashed them into a good seaworthy raft, upon which we piled all our belongings, stores, and outfit. Dalton swam the stream on horseback, the remainder of the horses following, and breasting the torrent magnificently. I took charge of the raft, and with the aid of the two Indians ferried everything across without mishap; upon arriving at the other bank, we did not feel inclined to proceed farther that day. We had been working several hours in the cold water while constructing our raft, and had still a little work to do in securely staking our craft well out into the stream, so that in the fall the decreasing waters would not leave it high and dry on shore.

The old Indian, Nanchay, emphatically objected to the delay. He said he was anxious

to reach his family again, and he endeavored to convince us that his wife and children would be mourning at his prolonged absence. We tried to coax the old fellow, but he remained obdurate, and asked for his pack, so that he might go on alone. We then appealed to his appetite, and promised if he would stay there the remainder of the day, and start at the earliest break of dawn, we would prepare him a well-filled pot of bacon and beans. Still he remained unmoved; but finally the offer of two silver dollars deprived him of all inclination to march on ahead. He took his old flint-lock musket, and loped away to the hillside in search of game, returning after a few hours with one rabbit and a ground-squirrel, both of which, after duly frizzling them on wooden spits, he ate up entirely. I noticed that the rabbit's ears appealed to his taste; he did not cook these, but merely held them in the flames till the hair was singed off, then nibbled them up close to the animal's skull. Nanchay was only a little man, but he was the possessor of the ordinary Indian appetite, which is regulated solely by circumstances. Though he had eaten these two animals, he did not deny himself the liberal allowance which he received each meal from our mess.

For the next three days we tramped over valleys of rocks, threaded a way amidst a labyrinth of pools and lakes and swamps, crossed fertile grass-lands, and finally ascended to a table-land, and tramped along a ridge of thickly wooded foot-hills, through which in places we had to cut a trail. This part of the land is known to the Indians as Shak-wak, being an immense valley running northwest from Lake Kusu-ah almost to the eastern arm of the Copper River. This low-lying area has within its limits ranges of hills, forests, swamps, lakes, and streams, and throughout its whole extent traveling is tedious and difficult. We saw but very few signs of Indians here. The land is seldom visited even by them. There is actually no definite trail. Indians wandering in search of game adopt roads as their judgment guides them. Here and there an old fox-trap could be seen, and a few rude huts of tamarack boughs used as winter camps by hunters and trappers, and stumps of timber ten or twelve feet high cut when the snow was deep. Every time we reached exposed positions our Indians would set fire to trees, but no answering column of smoke replied to the signal; we were the sole occupants of this vast region. Nanchay was a capable guide, he knew every inch of the land, but he was very glum and uncommunicative, and when possible always substituted for conversation a mere grunt. On the trail he trudged

SOME OF NANCHAY'S RELATIVES.

along at a deliberate pace, continually examining the ground for fresh tracks of game, and casting his eye every now and then to the mountain heights, scanning the hillsides in hopes of seeing a goat or a mountain sheep. He always carried his old flint-lock, but, with the exception of a few tiny ground-squirrels not worth the powder and shot, he killed nothing. He began to get concerned that no signal could be obtained conveying tidings of his friends. At the next camp, though we had had a hard day's travel, he decided to go on, leaving his son Tsook behind with us, and also intrusting us with the transportation of his belongings. After a few hours' travel next day, we caught up to the old Indian again. He had left us the night before, professing that he was unable to rest till he was again in the midst of his sorrowing family, but on the way he had discovered a small stream well stocked with trout, and forgot at once connubial anxiety at the prospect of a good catch of fish. By the time we arrived he had a lot of them spread out to dry in the sun, and a pile of heads, tails, and fins showed signs of sumptuous banqueting. He lashed up his newly acquired supplies,

OUR HUNTER.

husband and father after a long and hazardous journey; but no one displayed the slightest concern at his presence. Our arrival with the strange, big animals they had never seen before created a great commotion, but Nanchay entered the family circle unnoticed. When the wife's curiosity at seeing our horses had subsided, without exchange of greeting with her husband she continued dressing the moose-hide she was engaged on when we arrived, and the dogs and children slunk away, and eyed our movements through the bushes. There were at the camp a score of Indians, natives of lakes Hootchy-Eye and I-she-ik, this number including only two men besides Nanchay and his son. In some ways they were very objectionable, but they were very kind to us, and behaved more hospitably and reasonably than any other natives I have met in that land. They were extremely poor, and small gifts of fish-hooks, beads, and needles induced them to display a friendly disposition.

They were living under rude shelters of branches strewn round as a wall, with a layer of tamarack boughs thrown over a few cross-sticks and hoisted on props above their heads, which served also for drying fish and game. They were all busy collecting and preparing

which we tied to a pack-saddle, and started on our way. He said his wife had moved camp from where he had left her, and really he did not know where she was. He began an incessant signaling by burning trees, and by and by the keen eyes of Tsook spied a faint curl of smoke creeping up from the wooded brow of a hill about ten miles away, which told of the whereabouts of the missing family. Our pace was now quickened over the trail, which ran through a big stretch of rich grass-land of finer quality and more prolific growth than any we had yet seen, where hay sufficient to winter a whole pack-train could be put up without difficulty.

When we reached the Indian hunting-camp we naturally expected to witness a scene of joy and some expression of feeling at the return of the

a supply for the long winter months ahead; already their roofed platform sagged and creaked and threatened to topple over with its weight of caribou, moose, mountain sheep, rabbits, squirrels, and fish, the fat from which, subjected to a smoky fire and the sun above, was melting, and kept up a constant dripping on the occupants below. All the big game had been killed by one young hunter; the other Indian, Goo-shoon-tar, was his grandfather, a gaunt old fellow, dressed in buckskin trousers and shirt begrimed to a serviceable thickness with blackened grease. The trapping and snaring department was managed entirely by the women and children. While at this camp the natives kept us well supplied with game, and delicious moose-steaks, mutton cutlets, and sun-dried rabbits reinforced our usual insipid fare.

The natives do not cultivate the ground in any way. They are essentially meat-eaters, though in the summer they gather a great many berries, which they mix up with fat. During our journey we saw blackberries, raspberries, gooseberries, pokeberries, juniper-berries, and other small fruits, and also a species of blackberry about the size of buckshot, of a watery, tasteless consistency, quenching to the thirst. In the beginning of August these natives begin to hunt for their winter supply of meat and fish. They make camps such as the one we were visiting, then branch out from these, and scour the land in all directions. All the meat, when dried by smoke and sun, is lashed into convenient bundles, and the hides are dressed and carefully folded. When they have killed off or frightened away all the game from a district, they shift their quarters to a new hunting-field. Late in the fall, when the snows are hard, they construct snow-shoes of poplar and thongs of leather, and carry their supplies back to headquarters on sledges. At each camp, when operations are complete, the accu-

OLD GOO-SHOON-TAR.

mulation of meat and fish is cached in rocky caverns, in the forks of trees, and in little log storehouses built on tall piles out of reach of wild animals.

Some of this provision is left for winter excursions, for the Indians will be roaming over the land again a few months hence, trapping the fur-bearing animals, and a supply of food at different points of the land relieves them of the necessity of transporting it. In the spring they go south to Neska-tahen, and there meet the Chilkat Indians, with whom they trade their skins and furs. Some, however, take the northern trail, and barter their winter catch with the white traders on the Yukon River. We learned from the Indians here that we could reach that stream in six or seven days, but the season was now too far advanced for the undertaking. To the southwest of our position, about a hundred miles away, was the Mount St. Elias region; to the north of us the natives told of two very large lakes, Hootchy-Eye and I-she-ik, which we deeply regretted it was not in our power to visit. To the west was another big lake, Tloo Army.

There were a few muskets among the Indians we met in the interior, but they killed a great deal of their game with bows and arrows, some of which were pointed with iron and copper, and others with bone. Even the little boys were very expert with these weapons. These Indians were the lightest-hearted that we met during the whole season. Comforted by a generous supply of food, they appeared to be in good spirits; the boys, when not required to carry loads of meat from the hunting-ground back to camp, competed with one another in wrestling, throwing stones, shooting arrows, running, and jumping, and they amused themselves once or twice by throwing one another up on a moose-hide. A big skin was selected, and slits cut all round its edges with which they could get a good hold with their hands; then all the bigger members of the band would form a circle and stretch the skin taut, holding it about four feet from the ground. One boy would stand on this, and they would endeavor to throw him off his feet by violently jerking him in the air; some of them were tumbled off in a most unmerciful way to the rocks around, but though they got badly bruised, they never complained. Many of the boys were very expert, and the wielders of the moose-hide failed to throw them off their feet. Their agility was

remarkable; they would appear in the air in all kinds of positions, but managed to alight on their feet again. I succeeded in getting an instantaneous picture of one of them in mid-air. There were always a lot of these youngsters around our camp, apparently interested

DRAWN BY MALCOLM FRASER.

HOOTCHY-EYE STOREHOUSE.

in our doings and strange belongings, but they never stole the smallest thing from us.

At different times samples of native copper have reached the coast. These interior Indians have bartered it with other tribes, some of whom have taken it down the Copper River to the trading-posts on the sea, and the white men have had brought to them pieces of the pure metal weighing several pounds, and showing signs of having been hacked off a solid block. All the coast tribes refer traditionally and historically to the Copper Mountains of the interior. In former days the weapons and utensils were beaten out of this metal. Old Khay Tsoo, the powerful Chilkat warrior, despatched his slaves far inland with loads of seal fat to exchange for copper, but the warlike tribes living on the head waters of the White and Copper rivers attacked them so fiercely and persistently that the traffic ceased. The Indians at Nanchay's camp gave most encouraging accounts of the rich deposits of the metal away to the northwest of our position; they assured us that boulders of solid copper were piled at the bases of the mountains, from which they chopped off all they needed. Of course their information

was highly colored for our edification, though they had several little nuggets with them which they carried for repairing purposes. The old man had a band of it strapped around the bowl of his pipe, and the young hunter used barbed arrow-heads beaten from the metal in its natural state. They told us that they had several lumps in the village, each as much as a man could carry.

A few days' march from that camp, a big stream heading from a group of mountains flowed to the north; on the map it is charted as the White River, on account of the milky color of its glacial waters, but to the natives it is known as "Eark Heene" (Copper River). The whereabouts of these copper mines is a mystery, but the combination of traditional reference and of fact, though exaggerated, convinces me that the problem could be solved, and that a well-planned research would be rewarded by the discovery of rich mineral deposits. We tried hard to get Nanchay or some of his people to pilot us to the interesting region, but they were all too jealous of their precious possessions to divulge the secret of location, and they emphatically declined, saying that the land was far away and the trails bad. Nanchay tried to console us with the promise that should we return another season, he would guide us to the place; but he wished to assure us that the present summer was too far advanced, and soon the winter snows would begin to fly.

A few days after our arrival the band of Indians divided into two parties and took the trail for new hunting-grounds. Nanchay was going in search of moose in the grassy hilltops to the north. He marched off at the head of a cavalcade of women, boys, and girls, all carrying heavy loads of blankets, old cooking-tins, fish-nets and poles, parcels and baskets of dried meat and fish, bundles of hides, and a goodly sprinkling of babies lashed securely on the packs. Nanchay himself carried a very light load, and was the only man in the procession, which included two wives, three daughters, various mothers, mothers-in-law, grandmothers, aunts, and nine dusky youngsters of different shapes and sizes, with about sufficient apparel distributed among them to render one ordinary human being decent. The remainder of the band were going to hunt sheep on the mountains around Lake Tloo Arny, which lay to the southwest, and we agreed to carry their loads for them so as to benefit by their guidance. These Indian bundles were very undesirable freight, being composed of semi-dried meat, stale fish, unwashed rags, and rancid fat. The natives were shrewd enough to take advantage of circumstances; they marched slowly, snared small animals *en route*, and gathered armfuls of herbs and roots, all of which we piled on our horses. By the time we reached

the big lake, each of our animals was loaded down with their rubbish.

The drier lands of the interior are perforated and tunneled in all directions by the small ground-squirrels, which keep up an incessant piping. These little creatures are about the size of an ordinary gray squirrel, but have only a short tail. When on the ground they appear to be about six inches long, but their anatomy seems to be telescopic; for, when standing on their hind legs on the alert at some one's approach, they lengthen out till they are half as long again. The expert efforts of a band of Indian women with their snares will hush a whole colony of these little animals in one day. The women leave camp at about five o'clock in the morning, and return home at night with several hundred squirrels, the skins of which are patched into robes, and the meat is one of their favorite luxuries.

Lake Tloo Arny is a most important waterway; at its southern extremity it is seven miles wide, and stretches like a sea away to the northwest as far as the eye can reach. The Indians say that at its northern end a river drains into the Yukon; if such is the case, transportation can be carried on from this point by water. This immense sheet of water, along the shores of which the Indians say they sleep five nights traveling from one end to the other, is near the boundary line, and when the United States and Canadian governments do really decide to survey the limits of their respective possessions, the use of these waters will be a great aid to them. Streams draining the land around have grooved out ways from all points of the compass. The mountains around are rich in cinnamon, and the cañons hewn out in the rocky uplands show signs of silver and gold; but though there is plenty of good quartz, still we found no free metal. The general formation was granite, slate, and quartz, which is a good combination for mineral prospects.

Having reached the lake, the Indians made their camp on the hillsides; we pitched our tent on the stone flats near Goo-shoon-tar's. The old Indian urged us to return to the coast. "Winter is near," he said, and, pointing to the freshly whitened mountain-tops, warned us that the snow would soon be falling in the valleys.

Hidden away in the bushes we found a small Indian dugout, and Dalton and I decided to repair this and make a few days' exploring journey in it on the lake. We left our horses securely hobbled on a fine patch of grass-land in the neighborhood, then loaded up our tiny craft, and pushed off. The water, which was perfectly calm when we started, became gradually ruffled; but we made good headway with the paddles until we were crossing a bight in

making a short cut to a rocky bluff ahead. A stiff northerly breeze was springing up, and the water was getting rougher every minute, and began to tumble in over our slight bulwarks. Despite my greatest efforts at baling, the water was gaining on us, the little craft was slowly settling, the breeze had grown to a squall,

this a big sea with a hissing crest swept us ashore, where, paralyzed with cold and battered almost senseless, we lay in a heap piled on the rocks with a splintered canoe. It was a cruel disaster, and deprived us of property not to be replaced. Our two rifles, ammunition, mining-tools, cooking outfit, provisions, Dalton's watch

and high waves rolled on all sides. Our canoe was rapidly sinking, and was already below the surface when Dalton and I, realizing that to save our own lives was all we could hope for, jumped into the water and quickly overturned the craft, spilling the contents into the lake. The cottonwood, relieved of its weight, floated bottom upward to the surface again. Then Dalton clung to the bow, and I to the stern, and we kept above water in this way. We swam toward the shore. Angry waves rolled over our heads, flinging us about as if trying to wrench away from us the upturned dugout, which alone could save us. The wind blowing along shore denied us aid, and the icy waters had chilled us till we were almost speechless; but we doggedly fought our way, and at last were nearing the shore. The prospect of saving ourselves was still a feeble one. On shore a bare wall of stone caving in at the water-line bordered the lake. We were rapidly carried on to this by the rolling breakers, which flung us against the rocky wall, or carried us in a surging foam into the hideous cave beneath. Each time we struck we propelled ourselves violently along the wall. Soon we found an opening, and when abreast of

and chain, scientific instruments, etc., sank in the depths of Lake Tloo Army. At the time we were so thankful to save our lives that neither of us thought for a moment about the loss of property. Our blankets and my camera and notebooks were fortunately secured; fastened in a big oil-sack to keep them dry, they floated on the surface, and when the storm had abated we picked them up none the worse for the mishap. I have had the contents of a flint-lock musket emptied at me at short range, and have experienced the comforting sensation as the bullet missed its mark; I have felt the satisfaction of stopping a charging buffalo; but I don't think I ever felt such heartfelt thankfulness as when I was out of reach of the angry waves on the rocky shores of Lake Tloo Army.

The head of Lake Tloo Army was the farthest point reached by us. I have made a rough chart of the land through which we passed since leaving the coast, but scientific instruments subject to the jolting and hard knocks attendant upon such a journey enabled me to record only a crude idea of the lay of the land.

During the whole season we saw but little game—a few bears out of reach and some

DRAINING THE MOUNT ST. ELIAS RANGE.

mountain sheep on the heights. A small-bore rifle or a shot-gun is most serviceable in central Alaska, for there is a fair quantity of grouse, ptarmigan, squirrel, and duck.

Our season's travel took us over the entire basin of the Alseck, a river which drains an enormous territory. At the outset of our journey, having crossed the divide, we traced its eastern branch, the Tarjansini, which, gathering on its way waters from mountain torrent and snow-field, flows toward Neska-ta-heen. Fifty miles to the north of the Indian settlement another tributary of the Alseck heads from Lake Kloock-Shoo, and, winding amidst the hill-lands, courses south and joins the Tarjansini, and these combined forces sweep across the rocky vale at Neska-ta-heen in a rapid torrent.

Then from the west, from an immense glacier and moraine near Lake Tloo Army, the Kaskar Wurch begins its southern journey, and is swelled at once into a dangerous river by the muddy waters hurled into it through gorge and cañon crushed in the mountains by the moving ice-fields sloping from the Mount St. Elias range. This stream, flowing to the south and west, is joined by still another arm, which has its birthplace in Lake Dassar-Dee-ash, to the north in Shak-wak valley. These two waterways flow and eventually pour into the Alseck

itself, a wild, dangerous river which races along with an eight-knot current, its volume at times spread over the rocky valley in a dozen channels which combine in one deep torrent when the mountains close in and narrow the limits with their rocky walls. Along the banks of the Alseck old moraines slope to the river's edge, and active glaciers are pushed far out into the stream; the internal working of the ice-field maintains a continual rumble, and blocks of ice topple into the river, and whip the waters into a confused, seething mass. Eighty miles to the east of Yakutat, on the south coast of Alaska, the Alseck River plunges in one deep, angry torrent through a cañon of rock and ice, flows over the stony waste known as Dry Bay, and pours a muddy volume into the blue waters of the Pacific Ocean.

The nature of the whole land can be roughly divided into three conditions: Snow- and ice-fields bury the coast-range and choke up every hollow; to the immediate north the valleys are rocky and barren, but the vast interior beyond is richly clothed in luxuriant vegetation. Scientific authorities theoretically mapped out giant ice-fields as spreading over the entire land from the Fairweather and Mount St. Elias ranges north almost to the valley of the Yukon.

Colossal heights mantled in never-melting

snows tower thousands of feet in the air, but within the shadow of these mighty uplands, in the sheltered hollows beneath, lie immense valleys carpeted in richest grasses, and gracefully tinted with wild flowers. Here in the summer a genial clime is found, where strawberries and other wild fruits ripen to luxuriance, where there are four and a half months of summer and seven

third time, Dalton sprang off his back, and grabbed the tail of the horse I was riding, holding on to his horse's bridle with the other hand. My little mare was a powerful swimmer, and she was able to tow the strange procession to safety.

Upon our return to the coast, we took the same trail by which we had entered the land ;

GRASS VALLEY OF THE INTERIOR.

and a half of winter. In June and July the sun is lost below the horizon only for a few hours, and the temperature, though chilly at night, has an average of sixty-five degrees in the daytime.

We carried with us a supply of bacon, beans, flour, rice, and dried fruits, which

lasted all the season, and when we arrived on the coast we had still a month's provisions left. We took extra horseshoes with us, but the difficult trails soon decreased our stock, and Dalton displayed great ability in shaping out a pair of shoes from an old English musket which we found in an Indian rubbish-heap.

Miners and prospectors have for many years been seeking a practicable way into the land through which we traveled, but the mountain-passes and want of transportation have kept them back. The trail is now broken and the way open to miners and Government agents.

When swimming the Kaskar Wurch on our return journey, Dalton, together with one of our horses, had a narrow escape. In mid-stream the animal was attacked by cramps, and sank three times. Upon rising to the surface the

our horses were in splendid condition, and we rode them nearly all the way. The day we left Neska-ta-heen homeward-bound there were sixteen degrees of frost, and we passed through three snow-storms; at one place it had drifted till it was four feet deep. We had heeded the old Indian's warning none too early. For winter makes an abrupt entry in this land, and begins its stern rule with but short preliminary. The gradual whitening of the hilltops heralds its approach. The warning screech of the water-lion tells that storms are nigh. Rapidly the dazzling curtain rolls down from the heights around, covers up cañon and gulch, buries the forests of spruce and tamarack, and spreads over the valleys below an unbroken field of snow. The roar of the summer torrent is hushed, and lake and stream are frozen hard.

THE MAN WITH A VIOLIN (PORTRAIT OF T. COLE), BY WYATT EATON.

# DOGGETT'S LAST MIGRATION.

WITH PICTURES BY E. W. KEMBLE.

HE funeral was over, and the Old Man looked somewhat disconsolate. I refer to Old Man Doggett of Broken Bow. Mr. Doggett's baptismal name is in my possession, but few knew it in Broken Bow; fewer

still cared anything about it. It was, in fact, a name which the elderly Mr. Doggett used in his dealings with the United States government, and for no other purpose, and it looked odd even to him when he saw it on land-office papers.

The Old Man, as I have intimated, did not look particularly cheerful, but his actions were far from denoting despondency. It was Mrs. Doggett, sharer of his joys and sorrows—mostly sorrows—for something over forty years in a zigzag course from the Eastern States to his present location in the Territory of Dakota—it was Mrs. Doggett, I say, who had departed this life. Mrs. Doggett had been a faithful, patient wife, and had gone to the reward of this kind of wives. Her funeral had been numerously attended by the people from the eleven houses which made up the city of Broken Bow, and from the score or so of settlers' "shacks" scattered about on the prairie in the neighborhood. Hers was the first death to come upon Broken Bow. She had been laid at rest in the Prairie View Cemetery,—"thus," in the well-chosen words of the Broken Bow "Van-Guard," "inaugurating this sacred spot so thoughtfully set aside in the Third Ward by the founders of our city."

The ancient Mr. Doggett sat in front of the Settler's Home hotel as the hazy October sun sank toward the west. A few fellow-citizens surrounded him in easy attitudes. Nobody said much. Each was engaged in the laborious work of watching the down of the ripened milkweeds, which, ignoring the metropolitan claims of the city, was floating lazily about. Justice of the Peace Barlow came up and sat down near the Old Man. After moving about uneasily for a minute or two, this worthy ornament of the bench offered a few words of condolence to the bereaved old gentleman. "Yes," replied the latter; "it is a little hard on me at my time of life. I'm gettin' old, Judge."

"Pretty well along for this country, that's so," assented the ingenuous Barlow; "but back in the States, now, you would n't be so very vener'ble, Old Man."

"No; you're right," answered Doggett. "But I'm goin' to miss her, I reckon, specially when I move West. She was very handy at movin'. Prob'ly she had to be," he added thoughtfully; "we h'isted West sev'ral times."

This produced a faint smile on the faces of his hearers, not because there seemed to be anything incongruous in the idea of going West on the banks of the Missouri River, but because the Old Man had been talking of it ever since he arrived a year ago, and the public had lost faith. "The Old Man will never go West no more than me," Bill Dows had once announced sententiously; but since Bill had gone to that region inside of a week after being thus moved to prophecy, not much was thought of his view.

"Miranda," continued the Old Man after a pause, "was most remarkably handy at cookin' outdoors. I al'ays liked to set on the wagon-tongue when we camped, an' take care o' the children an' the dogs, an' watch her toss up the skillet an' flip a flap-jack. Never knowed her to fail but once, an' that was thirty year ago in Injeana. I'm goin' to miss her on the road, an' that's a fact. But I can't help it. I reckon I'll start to-morrow. Boys," he added, with a fairly cheerful if not wholly necessary oath,— "boys, come in an' have a drink."

I scarcely need to say, I suppose, that the old gentleman's call to the thirsty was unani-mously heeded by the group around the open door of the Settler's Home. Nor need I say, probably, that his apparent callousness to the loss of his wife met with unfavorable comment on the part of the few women of Broken Bow. Woman will stand abuse, but not neglect; her husband may be a tyrant so long as he is miserable during her absence. The women of Broken Bow were holding an informal meeting at the house of Justice Barlow, opposite the Settler's Home.

"I tell you, it is scandalous the way the Old Man acts," announced Mrs. Barlow, who made a specialty of "speaking her mind." "Such a man don't deserve a wife; for my part, I can't see why the Lord let him have one as long as he did. And after she'd moved West with him twenty times if she had once, too. It ain't

any light thing to sleep in a wagon and get meals over a fire on the ground—I've tried it." The excellent Mrs. Barlow seemed to believe that the late Mrs. Doggett's outdoor perambulating housekeeping should cause her bereaved spouse to melt into tears if nothing else would, and this view of the case was gen-

"I 'M GETTIN' OLD, JEDGE."

erally shared by the other women present. But the Old Man found one champion even among them, though I am bound to say that she was an unmarried woman, knowing but little about the undeserving creature, man. This was Miss Holley, the schoolmistress.

"I think," said Miss Holley, the schoolmistress, "that the Old Man feels worse than we know; I was talking with him yesterday. He does n't know any better than to act the way he does; he thinks it would be unmanly to show any grief. But he means well, I am sure."

Miss Holley was regarded with a mingled expression of pity and contempt by the experienced married women present, so she said no more in defense of the unpopular Mr. Doggett. But when, as it began to grow dusk, she went out to go to her "claim," which she was "holding" a half-mile from town, and where she was obliged to stay a night or two each week to appease an exacting government, she met the Old Man on the corner. There was a touch of unsteadiness in the old gentleman's legs, and truth compels me to confirm the penetrating reader's worst suspicions, and to admit that it came from the too industrious absorption of Broken Bow liquor, a fiery fluid utterly unfit for either man or beast. But the Doggett mind was clear and active.

"Good evenin', Miss Holley," he said. "Goin' out to comply with the law, eh? He, he!" The superfluous laugh came from the same cause as the undesirable unsteadiness.

"Yes, Mr. Doggett," answered Miss Holley,

as she turned toward him, and the rich, soft light of the sunset lighted up her face. "Are you going home now?"

"I dunno. Reckon I'd better?"

"Yes; I think so. You've been drinking, Mr. Doggett."

The Old Man's first impulse was to say, "S'posin' I have?" but he thought better of it. Her tone showed that she was sorry. This surprised him,—he was not accustomed to anything of the kind,—and it also touched him. But he decided that it was safer to remain facetious. So he said: "That's so, Miss Holley; but the Gover'ment ain't made no law that a man on a claim can't drink, has it? Ain't we got no rights left, nohow?" and the old humorist laughed querulously. He noticed as the light still flooded her face how handsome she was.

"Your wife would not have liked to know that you were going to get drunk to-day." The girl looked at him steadily. The Old Man bowed his head. His stooped form was outlined against the golden sky, which burned far off across the level prairie.

"I ain't so very drunk, am I?" asked the Old Man in an apologetic tone.

"No, you are not very drunk; but why did you get drunk at all?"

The Old Man's head sank still lower, and he was silent for a full minute. Finally he answered:

"I dunno. I had n't oughter. I did n't know what else to do. I was lonesome. It's lonesome ev'rywhere now. I ain't goin' home; it's lonesome there than anywhere else."

"Yes; you would better go home. It is the best place for you, even if it is lonesome. Come, I will go part way with you."

The Old Man looked at her doubtfully, and then started off along the mark across the prairie which, by a stretch of courtesy prompted by intense local patriotism, was called a road. They went in silence some distance, the girl slightly in advance, the Old Man with his head bowed. Then she paused and turned, this time with her back to the dying west, while the fading light, now gray and almost gloomy, fell on the face of the Old Man.

"There," she said, "it is only a quarter of a mile farther. You will go, will you not?"

"Yes, Miss Holley; I will. It's the best place for me. But it is lonesome there without her—mighty lonesome. I reckon I never knowed how much lonesome she was till now."

"Yes, yes; but you must try and be as cheerful as you can. You know you are going West some day."

"You believe it, do you?" answered the Old Man, eagerly. "Of course you do; you're sensible. You know when a man says that he's goin' West that he means it. The rest

MRS. BARLOW.

of 'em don't believe it, but I knowed you did all the while. Of course I 'm goin' West; of course. You've got some sense."

"Yes, you are going West again some day," replied the girl; "but not now—not this fall. You must stay here this winter, and go in the spring."

"No, can't do that; I must go now. I don't like this country; it's gettin' too much settled up. They're talkin' of a railroad comin' through here, an' somehow I don't like 'em. This land don't suit me, anyhow. They say there's the best land in the world in the Hills. I 'm goin' across the reservation into the Hills. I 'm goin' alone; there's nobody to go with me now, except Tige an' the hosses. They're better 'n nothin', but they can't talk, though Tige barks in sev'ral different ways. It'll be lonesome travelin' without her—an' her heart was set on the trip. She did n't like it here no more than me. She was of the 'pinion that the s'ciety wa'n't what it oughter be. She never liked the way that town crowd tries to put on airs, an' act stuck up. But she al'ays said you was a nice girl; I reckon she knowed you believed we was goin' West."

"Perhaps," assented the other, with a faint smile. "She was a good woman, and I am sure it will be very hard for you to move West without her. But I must go now. Good night; you will go home now, won't you?" and she put out her hand for his. Shaking hands was a form of social dissipation which the Old Man had largely risen above, but after some hesitation he extended his hand. She took it, pressed it slightly, gathered up a white shawl about her shoulders, and walked away through the dry grass toward her little eight-by-ten house now faded out of sight across the prairie in the fast-gathering darkness. The Old Man gazed after her in considerable bewilderment.

He looked at the hand she had taken in hers, and was somewhat reassured on finding that it appeared to be in its normal condition. Then he looked back toward the town, and saw the lights in the Settler's Home. He took a step in that direction, then turned and started for home with a fairly resolute tread. "I 'll go home, as she told me to," he said. "She's the smartest girl in the Territory; she knows what's the thing for me to do, and she knows I am goin' West." His pace slackened a little, and he was silent. "There's Tige and the hosses, anyhow. They'll be some company, but not much. Oh, it's lonesome without her! It's—" The Old Man's voice choked, but he walked on. Soon he came to a little depression in the prairie through which the road ran, and he stopped, and by the last faint light from the west, and the fainter light from the stars, he gathered a bunch of the wild sunflowers which grew there, and which had all day been tossed about on their long, graceful stems by the south wind. Then the Old Man, with the flowers in his hand, went on through the darkness to the place he called home.

At the time of which this history treats the American locomotive had been in full cry after the fleeing Mr. Doggett for over half a century. It had not come up with him for any length of time. There are sailors who never go down to the sea in ships,—born wanderers of the land, latter-day gypsies,—who look upon a covered wagon and a team of horses as a true-born sailor looks upon his ship. Mr. Doggett first saw the light of day near the Atlantic

MRS. DOGGETT.

seaboard, but he soon abandoned the neighborhood. He found the region too crowded. It seemed stuffy and poorly ventilated to him. While still toiling in that fertile portion of the late Noah Webster's incomparable speller

"YOU 'VE BEEN DRINKING."

which is devoted to words of two syllables, he turned his attention to newspaper reports of the West, and especially of the farms which a paternal government was disposing of at a nominal price. So one night he went away from home, leaving parents behind who consoled themselves with ten other little Doggetts. He tarried in Ohio a few years, where he was married, and accumulated property to the extent of a wagon with a white cover, a team consisting of one mule and one horse, a gloomy cow, and four dogs. Then he began his great retreat from the locomotive in good earnest, which, at the time I write of, had consisted of twenty or thirty distinct removals, and had marked out an uncertain line from the Buckeye State to the Missouri River, reaching at one time as far south as Arkansas, and on another occasion as far north as Manitoba. His weakness for Government land had increased rather than diminished, and the number of "claims" which he had owned in different States and Territories was something startling, especially when we remember, as inexorable fact forces us to do, that after the first one or two, he had had no right to them. But the old gentleman's conscience in regard to dealings with the Government was elastic, as I regret to say the consciences of men occupying higher positions in the social scale sometimes are. During all of this time, in which he never lived longer than five years in one place, Mrs. Doggett had been his uncomplaining companion. She was not a born wanderer, and sometimes she looked at old and well-kept homes, with their great shade-trees, and ample barns, and moss-roofed houses, and sighed; but she said nothing, and wandering finally became a second nature to her. Children had come to cheer the Doggetts. At one

time in Illinois six of them had gathered about the blazing fire beside the wagon, and watched their father industriously cleaning his rifle, and listened to his optimistic remarks on the amount of game he proposed to bag the next day. Two of the offspring had been born in the wagon, which always gave them a slightly warmer place in their father's heart. But the life had not seemed to agree with the little ones, and they had gone away to a land of fewer hardships, one in Kentucky, two in Missouri, one in Iowa, another in far-off Manitoba, as they camped by the lonely Red River of the North; and the last, a promising boy of fifteen, who could shoot with great accuracy, and get the better of the other fellow in swapping horses three times

out of four, in western Minnesota, where the Doggett home had temporarily been before it was moved to Broken Bow for another transitory pause.

Through all his troubles the Old Man had preserved a considerable degree of cheerfulness. He usually drowned his sorrows by moving West. He had determined to pursue this course on the present occasion. But he trudged along through the darkness with a heavy heart, and when he pushed open the door of his one-room house and went in, the place seemed very solemn and very lonely. He lighted a smoky lantern, and laid the sunflowers on the table. Then he sat down, and for a long time gazed at the dim and flickering light. Tige, a battle-scarred dog which had fought everything that two States and three Territories could furnish, claimed his attention, but did not get it. At last he arose, and looked about the room through the semi-darkness. He took down his rifle from the wall, examined it, and put it back in its place. "Yes," he said, half aloud; "I must start in the morning. It's too lonesome to stay here. I'll show 'em that I can go. Miss Holley knows I'm goin' now." Then his eye rested on the sunflowers, and he took them up. "I'll go an' put 'em on her grave," he said. "There can't nobody see me now." He went out, and started back along the path. There was no moon, but the stars were shining, though the sky was hazy. The fresh, steady south wind swept unimpeded across the level plain with a sharp, almost hissing sound in the long, dry prairie-grass,— "grass," as had been aptly remarked by the Broken Bow "Van-Guard," "so rich in albuminous and nitrogenous matter as to actually fatten stock to the point of ridiculous obesity." It was a strong, sweeping

wind, such as blows only on great mid-continent plains, or at sea. There was no cloud in sight, but the pall of haze was over the whole sky. The Old Man recognized it as smoke from distant prairie-fires. He looked about, but saw only a dull glow in the sky far to the south, which showed a fire there, but many miles away. Sometimes a tumbleweed, that odd but intelligent prairie product which spends the summer in growing round and bigger than a bushel-basket that it may break off at the top of the ground in September and travel with the wind for two or three months — sometimes one of these vagrant weeds would bound across his path and go rolling on in the darkness toward the north. This was the nearest approach to life which greeted the Old Man. He noticed that the lights of the hopeful young city of Broken Bow were extinguished. He walked straight to the grave, which was on slightly higher ground than the little clump of houses. The long grass had been trampled down for a few feet around the low mound. The Old Man stood and looked down upon it for several minutes. Then he placed the yellow flowers near the head. He stepped back, and sat down on a sod which had not been replaced. He clasped his hands about his knees, his head bent forward, and he sat gazing at the dim outlines of the mound before him. Tige, who had followed him from the house, crept up, and lay down with his head on his master's feet. The wind swept over them, the dog crept closer, and the Old Man's head gradually sank lower. Soon both slept, the man deeply, the dog lightly, and the blundering tumbleweeds were left in possession of the scene.

Three hours later the Old Man was awakened from his heavy slumber by a dismal howl close to his ear. He started nervously, turned his head, and found himself face to face with the dog, which sat on the ground in apparent deep distress of mind. The Old Man started to bestow a malediction of a highly profane nature upon the animal, when he caught sight of his own and the dog's shadow upon the mound before him. He raised his eyes to the northern sky, but it was even darker than when he had gone to sleep. The truth rushed in upon him. He leaped to his feet, and turned to the south, and saw a prairie-fire coming up with the wind. It seemed scarcely a half-mile away. Black, burned-out grass stems were falling all about. To the east and to the west, as far as he could see, there was the same wall of fire, the tongues of flame leaping up fiercely and lapping up the long, dry grass before them. And back of them was the wind with its sweeping rush. The Old Man first thought of his own house, but he remembered that one of the last

things which his wife had done before her sickness was to make him build a fire-brake around it, something he was ever adverse to doing till the fire was actually in sight. Then he thought of the rising city of Broken Bow, lying all unprotected. And here I may crave a line to say that the prairie community is usually like the Old Man in the matter of fire-brakes: it needs the stimulating influence of the approaching fire to make it go out and plow the two circles of furrows and burn the grass between them necessary for protection. And though Broken Bow had during the fall constructed (on paper) a court-house and several other important buildings, and had welcomed (in the imaginative columns of the "Van-Guard") the entrance of two railroads, she had utterly failed to provide the means of preserving the eleven houses which she really possessed. The Old Man did not pause after he realized the condition of the town. He seized his hat from where it had blown on the ground, and rushed away to give the alarm. In a few minutes he was pounding on the door of Judge Barlow's house. This able jurist put his head out of the window, instantly grasped the situation with his fine judicial mind, and retreated to clothe himself properly for the occasion, while the Old Man hurried away and began thundering on other doors. Tige began a judicious barking, which aroused the town dogs, and aided the good work of waking the other inhabitants from their dreams of city halls, trunk-lines, and so forth. In five minutes Broken Bow was making vigorous arrangements to welcome the coming fire. But Old Man Doggett was not among his fellow-citizens. He was rushing away across the prairie, straight toward the fire, to warn Miss Holley.

I suppose that the Old Man ran faster than he ever had run before. Already a great cloud of smoke rolled above his head, and the grass-cinders, still glowing, fell around him. He could see the little square, shed-roofed house ahead of him, standing a small black cube against the horizon of flame. The fire seemed almost upon it, but the Old Man did not despair of reaching it first. Tige kept well in advance, barking wildly. As they drew nearer, and the Old Man felt the hot breath of the fire in his face, the dog caught the idea of the proceedings, and

MR. PETER GATCHELL.

rushed farther ahead, and began scratching at the door of the humble dwelling and barking with fresh vigor. As the Old Man came up he saw a white face where the curtain was drawn aside at the one little square window. The flames were leaping higher than the house in the tall blue-joint grass a hundred yards away. "Dress yourself, an' hurry out here!" shouted the Old Man, above the crackling of the fire. The tarred paper which covered the roof was already burning. The face disappeared, and the dog ran to his master and crouched in terror of the approaching flames. The Old Man turned and faced what seemed a black cavern to the north; then he dropped on his knees in the long grass and drew forth some matches. His hand trembled, and he broke the first one. The wind blew out the second. He shielded the third with his hat, and thrust it into a dry bunch of grass before him. It caught and blazed up in his face. The dog leaped back and growled at the new fire. It caught the next bunch, and then the bunch to the right, and the one to the left. The wind took it up and swept it away to the north, leaving an oasis of black. The Old Man stamped out the feeble line of fire which tried to beat southward. He turned to the house as Miss Holley rushed out. The flames reached around the little dwelling from each side as if to shut her in, but she slipped through, and ran with the Old Man to the new-made place of safety. The flames came up to its edge, reached over, found nothing, leaped up angrily, and went out. In ten minutes the main fire, sweeping on to each side of the oasis, had overtaken the little saving fire and rushed away to the north. Nothing was left burning behind but the frail house. The strong sweep of the wind came again cool and fresh. The Old Man brought a buffalo skull, lying like a great white bovine ghost in the midnight black of the ashes, and Miss Holley sat down upon it, for she was weak and faint. They watched the wall of fire as it hurried away, only broken narrowly in one place by the Eagle Butte trail. The opening was slight, and the flames joined hands above it. But suddenly a horse and rider broke through the fiery door of the trail. The horse staggered and almost fell, and the rider reeled, but they came on, with the horse on a quick, nervous gallop. Miss Holley rose with a cry, and took a few steps forward. The horse dashed up and stood trembling as the rider, a tall young man, threw himself off and clasped the girl in his arms.

"Thank God, Kitty, you are saved!" said

the young man. She hid her face against his breast. Then they looked into each other's eyes.

"The Old Man saved me," said the girl. The young man took her hands tightly in his, and they turned to where Doggett had stood. They saw him walking away across the black plain toward his own house, with the dog close behind.

"TIGER DONE IT."

The people of Broken Bow did not return to their beds for what remained of the night, though the fire soon went past, and this metropolitan center was saved. Before long Miss Holley and Morton came, leading the scorched and frightened pony, and received the congratulations of the entire population on their escape. The good work of their fellow-citizen, Mr. Doggett, was generally recognized. But the old gentleman did not appear in town, though the sullen glare of the fire on the northern sky was chased away before the reddening east. It was proposed by Mr. Peter Gatchell, the editor of the "Van-Guard," who had during the excitement as ably guided the plow as he habitually did the pen, that a public meeting be called to pass suitable resolutions of thanks to the Old Man for his night's work. This met with an enthusiastic welcome, as the idea of a public meeting always did in Broken Bow. The task of calling the meeting was somewhat simplified by the fact that every man, woman, and child in the town was already gathered in the post-office. A chairman was elected, and Mr. Gatchell appointed to prepare the resolutions. In a half-hour he reported to the meeting with his work done. I will refrain from giving these resolutions in this place, able as they were, but will refer the reader to that week's issue of the "Van-Guard." They were adopted unanimously, and a committee of five,

headed by Justice Barlow, was appointed to present them to the Old Man. As the sun, big and red, rose up out of the blackened plain, the committee started for the home of the individual to be honored. When they arrived, knocking having brought no response, they pushed open the door and entered. The room was bare of even the little furniture which it usually held. The rifle was gone from its place. Neither the Old Man nor Tige was anywhere visible. But, pinned to the wall by a two-pronged fork, they found this:

Fellow Citizens and ladys and gentlemen:  
Tige done it.  
Yurs respectfully,  
A. DOGGETT.  
P. S. We hev gone West.

So the committee went back and reported a failure.

But the next afternoon the news came that the Old Man's horses had wandered back

alone, and were at their late home. A party, headed by Morton, were soon galloping over the trail to the west. They wound down a ravine to the Missouri just as the sun was sinking behind the barren bluffs on the other side. A little down the stream, near the swift-flowing, milky waters, they came upon the Old Man's covered wagon. The camp-fire of the night before had gone out. The horses' harness lay on the ground, and the yellow leaves from a giant cottonwood were scattered over it. The gurgle of an eddy in the river was the only sound. Tige stood sullen guard under the wagon, and growled angrily when the men came nearer and dismounted. But he knew Morton, and allowed him to go to the front of the wagon. He drew aside the flap and looked in. Then he let it fall, and said:

"It was too much for the Old Man. He will never go West again."

In his pocket they found a faded daguerreotype in an old-fashioned black case. The women at Broken Bow said it was a school-girl picture of the Old Man's wife.

*Hayden Carruth.*

"FOR BRAVERY ON THE FIELD OF BATTLE."

HE recruiting-office at Rivermouth was in a little unpainted, weather-stained building on Anchor street, not far from the custom-house. The tumble-down shell had long remained tenanted, and now, with its mouse-colored exterior, easily lent itself to its present requirements as a little military mouse-trap. In former years it had been occupied as a thread-and-needle and candy shop by one Dame Trippew. All such petty-shops in the town were always kept by old women, and these old women were always styled dames. It is to be lamented that they and their innocent traffic have vanished into the unknown.

The interior of the building, consisting of one room and an attic covered by a lean-to roof, had undergone no change beyond the removal of Dame Trippew's pathetic stock at the time of her bankruptcy. The narrow counter, painted pea-green and divided in the center by a swinging gate, still stretched from wall to wall at the further end of the room, and behind the counter rose a series of small wooden drawers, which now held nothing but a fleeting and inaccurate memory of the lavender, and pennyroyal, and the other sweet herbs that used to be deposited in them. Even the tiny cow-bell, which once served to warn Dame Trippew of the advent of a customer, still hung from a bit of curved iron on the inner side of the street door, and continued to give out a

petulant, spasmodic jingle whenever that door was opened, however cautiously. If the good soul could have returned to the scene of her terrestrial commerce, she might have resumed business at the old stand without making any alterations whatever. Everything remained precisely as she had left it at the instant of her exit. But a wide gulf separated Dame Trippew from the present occupant of the premises. Dame Trippew's slight figure, with its crisp white cap and apron, and steel-bowed spectacles, had been replaced by the stalwart personage of a sergeant of artillery in the regular army, between whose overhanging red mustache and the faint white down that had of late years come to Dame Trippew's upper lip it would have been impossible to establish a parallel. The only things these two might have claimed in common were a slackness of trade and a liking for the aromatic Virginia leaf, though Dame Trippew had taken hers in a dainty idealistic powder, and the sergeant took his in realistic plug through the medium of an aggressive clay pipe.

In spite of the starry shield, supported by two crossed cannon cut out of tin and surmounted by the national bird in the same material, which hung insidiously over the transom outside; in spite of the drummer-boy from the fort, who broke the silence into slivers at intervals throughout the day; in brief, in spite of his own martial bearing and smart uniform, the sergeant found trade very slack. At Rivermouth the war with Mexico was not a popular undertaking. If there were any heroic blood left in the old town by the sea, it appeared to be in no hurry to come forward and get itself shed. There were hours in which Sergeant O'Neil despaired of his country. But by degrees the situation brightened, recruits began to come in, and finally the town and the outlying districts—chiefly the outlying districts—managed to furnish a company for the State regiment. One or two prominent citizens had been lured by commissions as officers; but neither of the two Rivermouthians who went in as privates was of the slightest civic importance. One of these men was named James Dutton.

Why on earth James Dutton wanted to go to the war was a puzzle to the few townfolks who had any intimate acquaintance with the young man. Intimate acquaintance is perhaps too strong a term; for though Dutton was born in the town and had always lived there, he was more or less a stranger to those who knew him best. Comrades he had, of course, in a manner: the boys with whom he had formerly gone to the public school, and two or three maturer persons whose acquaintance he had contracted later in the way of trade. But with these he could scarcely be said to be intimate. James

Dutton's rather isolated condition was not in consequence of any morbid or uncouth streak in his mental make-up. He was of a shy and gentle nature, and his sedentary occupation had simply let the habit of solitude and unsociability form a shell about him. Dutton was a shoemaker and cobbler, like his father before him; plying his craft in the shabby cottage where he was born and had lived ever since, at the foot of a narrow lane leading down to the river—a lonely, doleful sort of place, enlivened with a bit of shelving sand where an ancient fisherman occasionally came to boil lobsters.

In the open lots facing the unhinged gate was an old relinquished tannery that still flavored the air with logwood, which lay here and there in dull-red patches, killing the grass. The undulations of a colonial graveyard broke tamely against the western base of the house. Headstones and monuments—if there had ever been any monuments—had melted away. Only tradition and those slowly subsiding wave-like ridges of graves revealed the character of the spot. Within the memory of man nobody had been dropped into that Dead Sea. The Duttons, father and son, had dwelt here nearly twenty-four years. They owned the shanty. The old man was now dead, having laid down his awl and lapstone just a year before the rise of those international complications which resulted in the appearance of Sergeant O'Neil in Rivermouth, where he immediately tacked up the blazoned ægis of the United States over the doorway of Dame Trippew's little shop.

As has been indicated, the war with Mexico was not looked upon with favor by the inhabitants of Rivermouth, who clearly perceived its underlying motive—the extension of slave territory. The abolition element in the town had instantly been blown to a white heat. Moreover, war in itself, excepting as a defensive measure or on a point of honor, seemed rather poor business to the thrifty Rivermouthians. They were wholly of the opinion of Birdofredom Sawin, that

Nimepunce a day fer killin' folks comes kind o' low fer murder.

That old Nehemiah Dutton's son should have any interest one way or the other in the questions involved was inconceivable, and the morning he presented himself at the recruiting-office a strong ripple of surprise ran over the group of idlers that hung day after day around the door of the crazy tenement, drawn thither by the drum-taps, and a morbid sense of gunpowder in the air. These idlers were too sharp or too unpatriotic to enlist themselves, but they had unbounded enthusiasm for those who

did. After a moment's hesitation they cheered Jemmy Dutton handsomely.

On the afternoon of his enlistment he was met near the post-office by Marcellus Palfrey, the sexton of the Old Granite Church.

"What are you up to, anyhow, Jemmy?" asked Palfrey. "What 's your idee?"

"My idea is," replied Dutton, "that I 've never been able to live freely and respectably, as I 've wanted to live; but I mean to die like a gentleman, when it comes to that."

"What do you call a gentleman, Jemmy?"

"Well, a man who serves faithfully, and stands by to lay down his life for his duty—he 's a gentleman."

"That 's so," said Palfrey. "He need n't have no silver-plated handles, nor much outside finish, if he 's got a satin linin'. He 's one of God's men."

What really sent James Dutton to the war? Had he some unformulated and hitherto unsuspected dream of military glory, or did he have an eye to supposable gold ingots piled up in the sub-basement of the halls of the Montezumas? Was it a case of despised love, or was he simply tired of reheeling and resoling the boots of Rivermouth folk; tired to death of the river that twice a day crept up to lap the strip of sandy beach at the foot of Nutter's Lane; tired to death of being alone, and poor, and aimless? His motive is not positively to be known, only to be guessed at. We shall not trouble ourselves about it. Neither shall the war, which for a moment casts a lurid light on his figure, delay us long. It was a tidy, comfortable little war, not without picturesque aspects. Out of its flame and smoke leaped two or three fine names that dazzled men's eyes awhile; and among the fortunate was a silent young lieutenant of infantry,—a taciturn but not unamiable young lieutenant,—who was afterward destined to give the name of a great general into the keeping of history forever. Wrapped up somewhere in this Mexican war is the material for a brief American epic; but it is not to be unrolled and recited here.

With the departure of Our Country's Gallant Defenders, as they were loosely denominated by some,—the Idiots, as they were compactly described by others,—monotony again settled down upon Rivermouth. Sergeant O'Neil's heraldic emblems disappeared from Anchor street, and the quick rattle of the tenor drum at five o'clock in the morning no longer disturbed the repose of peace-loving citizens. The tide of battle rolled afar, and its echoes were not of a quality to startle the drowsy old seaport. Indeed, it had little at stake. Only four men had gone from the town proper. One, Captain Kittery, died before reaching the seat of war; one deserted on the way; one, Lieuten-

ant Bangs, was sent home invalided; and only James Dutton was left to represent the land force of his native town. He might as well have died or deserted, for he was promptly forgotten.

From time to time accounts of battles and bombardments were given in the columns of "The Rivermouth Barnacle," on which occasions the Stars and Stripes, held in the claws of a spread eagle, decorated the editorial page—a cut which until then had been used only to celebrate the bloodless victories of the ballot. The lists of dead, wounded, and missing were always read with interest or anxiety, as the case might be, for one had friends and country acquaintances, if not fellow-townsmen, with the army on the Rio Grande. Meanwhile, nobody took the trouble to bestow a thought on James Dutton. He was as remote and shadowy in men's memories as if he had been killed at Thermopylæ or Bunker's Hill. But one day the name of James Dutton blazed forth in a despatch that electrified the community. At the storming of Chapultepec, Private James Dutton, Company K, Rivermouth, had done a very valorous deed. He had crawled back to a plateau on the heights, from which the American troops had been driven, and had brought off his captain, who had been momentarily stunned by the wind of a round shot. Not content with that, Private Dutton had returned to the dangerous plateau, and, under a heavy fire, had secured a small field-piece which was about to fall into the hands of the enemy. Later in the day this little howitzer did eminent service. After touching on one or two other minor matters, the despatch remarked, incidentally, that Private James Dutton had had his left leg blown off.

The name of James Dutton was instantly on every lip in town. Citizens who had previously ignored his existence, or really had not been aware of it, were proud of him. The Hon. Jedd Deane said that he had long regarded James Dutton as a young man of great promise, a—er—most remarkable young person, in short; one of the kind with much—er—latent ability. Postmaster Mugridge observed, with the strong approval of those who heard him, that young Dutton was nobody's fool, though what especial wisdom Dutton had evinced in having his leg blown off was not clear. Captain Tewksberry, commanding the local militia company, the Rivermouth Tigers, was convinced that no one who had not carefully studied "Scott's Tactics" could have brought away that gun under the circumstances. "Here, you will observe, was the exposed flank of the heights, there, behind the *chevaux-de-frise*, lay the enemy," etc., etc. Dutton's former school-fellows began to remember that there had always been something tough and gritty in Jim Dutton.

The event was one not to be passed over by Parson Wibird Hawkins, who made a most direct reference to it in his Sunday's sermon—Job. xxxix. 25: "He saith among the trumpets, Ha, ha; and he smelleth the battle afar off, the thunder of the captains, and the shouting."

After the first burst of local pride and enthusiasm had exhausted itself over young Dutton's brilliant action, the grim fact connected with young Dutton's left leg began to occupy the public mind. The despatch had hinted vaguely at amputation, and had stopped there. If his leg had been shot away, was it necessary that the rest of him should be amputated? In the opinion of Schoolmaster Dennett, such treatment seemed almost tautological. However, all was presumably over by this time. Had poor Dutton died under the operation? Solicitude on that point was wide-spread and genuine. Later official intelligence relieved the stress of anxiety. Private Dutton had undergone the operation successfully and with great fortitude; he was doing well, and as soon as it was possible for him to bear transportation he was to be sent home. He had been complimented in the commanding officer's report of the action to headquarters, and General Winfield Scott had sent Private Dutton a silver medal "for bravery on the field of battle." If the Government had wanted one or two hundred volunteers from Rivermouth, that week was the week to get them. Then intervened a long silence touching James Dutton. This meant feverish nights and weary days in hospital, and finally blissful convalescence, when the scent of the orange and magnolia blossoms blown in at the open window seemed to James Dutton a richer recompense than he deserved for his martyrdom. At last he was in condition to be put on board a transport for New Orleans. Thence a man-of-war was to convey him to Rivermouth, where the ship was to be overhauled and have its own wounds doctored.

When it was announced from the fort that the vessel bearing James Dutton had been sighted off the coast and would soon be in the Narrows, the town was thrown into such a glow of excitement as it had not experienced since the day a breathless and bedraggled man on horseback had dashed into Rivermouth with the news that the Sons of Liberty in Boston had pitched the British tea overboard. The hero of Chapultepec—the only hero Rivermouth had had since the colonial period—was coming up the Narrows! It is odd that three fourths of anything should be more estimable than the whole, supposing the whole to be estimable. When James Dutton had all his limbs he was lightly esteemed, and here

was Rivermouth about to celebrate a fragment of him.

The normally quiet and unfrequented street leading down to the boat-landing was presently thronged by Rivermouthians—men, women, and children. The arrival of a United States vessel always stirred an emotion in the town. Naval officers were prime favorites in aristocratic circles, and there were few ships in the service that did not count among their blue-jackets one or more men belonging to the port. Thus all sea-worn mariners in Uncle Sam's employ were sure of both patrician and democratic welcome at Rivermouth. But the present ship contained an especially valuable cargo. It was a patient and characteristically undemonstrative crowd that assembled on the wharf, a crowd content to wait an hour or more without a murmur after the ship had dropped anchor in midstream for the captain's gig to be lowered from the davits. The shrill falsetto of the boatswain's whistle suddenly informed those on shore of what was taking place on the starboard side, and in a few minutes the gig came sweeping across the blue water, with James Dutton seated in the stern-sheets and looking very pale. He sat there, from time to time pulling his blond mustache, evidently embarrassed. A cheer or two rose from the wharf when the eight gleaming blades simultaneously stood upright in air, as if the movement had been performed by some mechanism. The disembarkment followed in dead silence, for the interest was too novel and too intense to express itself noisily. Those nearest to James Dutton pressed forward to shake hands with him, but this ceremony had to be dispensed with as he hobbled on his crutches through the crowd, piloted by Postmaster Mugridge to the hack which stood in waiting at the head of the wharf.

Dutton was driven directly to his own little cottage in Nutter's Lane, which had been put in order for his occupancy. The small grocery closet had been filled with supplies, the fire had been lighted in the diminutive kitchen stove, and the tea-kettle was twittering on top, like a bird on a bough. The Hawkins girls, Prudence and Mehitabel, had set some pansies and lilacs here and there in blue china mugs, and decorated with greenery the faded daguerreotype of old Nehemiah Dutton, which hung like a slowly dissolving ghost over his ancient shoemaker's bench. As James Dutton hobbled into the contracted room where he had spent the tedious years of his youth and manhood, he had to lift a hand from one of the crutches to brush away the tears that blinded him. It was so good to be at home again!

That afternoon Dutton held an informal reception. There was a constant coming and

going of persons not in the habit of paying visits in so unfashionable a neighborhood as Nutter's Lane. Now and then a townsman, conscious that his unimportance did not warrant his un-introduced presence inside, lounged carelessly by the door; and through the rest of the day several small boys turned somersaults and skylarked under the window, or sat in rows on the rail-fence opposite the gate. Among others came the Hon. Jedd Deane, with his most pronounced Websterian air,—he was always oscillating between the manner of Webster and that of Rufus Choate,—to pay his respects to James Dutton, which was considered a great compliment indeed. A few days later this statesman invited Dutton to dine with him at the ancestral mansion in Mulberry Avenue, in company with Parson Wibird Hawkins, Postmaster Mugridge, and Silas Trefethen, the Collector of the Port. It was intimated that young Dutton had handled himself under this ordeal with as much modesty and dignity as if he had always dined off colonial china, and had always stirred his after-dinner coffee with a spoon manufactured by Paul Revere.

A motion to give James Dutton a limited public banquet, at which the politicians could have a chance to unfold their eloquence, was discussed and approved in the Board of Selectmen, but subsequently laid on the table, it being reported that Mr. Dutton had declared that he would rather have his other leg blown off than make a speech. This necessarily killed the project, for a reply from him to the chairman's opening address was a *sine qua non*.

Life now opened up all sunshine to James Dutton. His personal surroundings were of the humblest, but it was home, sweet, sweet home. One may roam amid palaces,—even amid the halls of the Montezumas,—yet, after all, one's own imperfect drain is the best. The very leather-parings and bits of thread that had drifted into the front yard, and seemed to have taken root there like some strange exotic weed, were a delight to him. Dutton's inability to move about as in former years sometimes irked him, but everything else was pleasant. He resolved to make the best of this one misfortune, since without it he would never have been treated with such kindness and consideration. The constant employment he found at his trade helped him to forget that he had not two legs. A man who is obliged to occupy a cobbler's bench day after day has no need of legs at all. Everybody brought jobs to his door, and Dutton had as much work as he could do. At times, indeed, he was forced to decline a job. He could hardly credit his senses when this occurred. So life ran very smoothly with him. For the first time in his existence he found himself humming or whistling an accompaniment

to the rat-tat-tat of his hammer on the sole-leather. No hour of the twenty-four hung heavily on him. In the rear of the cottage was a bit of ground, perhaps forty feet square, with an old elm in the center, under which Dutton liked to take his nooning. It was here he used to play years ago, a quiet, dreamy lad, with no companions except the squirrels. A family of them still inhabited the ancient boughs, and it amused him to remember how he once believed that the nimble brown creatures belonged to a tribe of dwarf Indians who might attempt to scalp him with their little knives if they caught him out after dusk. Though his childhood had not been happy, he had reached a bend in the road where to pause and look back was to find the retrospect full of fairy lights and coloring.

Almost every evening one or two old acquaintances, with whom he had not been acquainted, dropped in to chat with him, mainly about the war. He had shared in all the skirmishes and battles from Cerro Gordo and Molino del Rey up to the capture of Chapultepec; and it was something to hear of these matters from one who had been a part of what he saw. It was considered a favor to be allowed to examine at short range that medal "for bravery on the field of battle." It was a kind of honor "just to left it," as somebody said one night. There were visitors upon whom the impression was strong that General Scott had made the medal with his own hands.

James Dutton was ever modest in speaking of his single personal exploit. He guessed he did n't know what he was doing at the moment when he tumbled the howitzer into the ravine, from which the boys afterward fished it out. "You see, things were anyway up on that plateau. The copper bullets were flying like hailstones, so it did n't much matter where a fellow went—he was sure to get peppered. Of course the captain could n't be left up there—we wanted him for morning parades. Then I happened to see the little field-piece stranded among the chaparral. It was a cursed nice little cannon. It would have been a blighting shame to have lost it."

"I suppose you did n't leave your heart down there along with the senioriteers, did you, Jemmy?" inquired a town Lovelace.

"No," said Dutton, always perfectly matter of fact; "I left my leg."

Ah, yes; life was very pleasant to him in those days!

Not only kindnesses but honors were showered upon him. Parson Wibird Hawkins, in the course of an address before the Rivermouth Historical and Genealogical Society, that winter, paid an eloquent tribute to "the glorious military career of our young townsman"—which was no more than justice; for if a man

who has had a limb shot off in battle has not had a touch of glory, then war is an imposition. Whenever a distinguished stranger visited the town, he was not let off without the question, "Are you aware, sir, that we have among us one of the heroes of the late Mexican war?" And then a stroll about town to the various points of historic interest invariably ended at the unpretending door-step of Dutton's cottage.

At the celebration of the first Fourth of July following his return from Mexico, James Dutton was pretty nearly, if not quite, the chief feature of the procession, riding in an open barouche immediately behind that of the Governor. The boys would have marched him all by himself if it had been possible to form him into a hollow square. From this day James Dutton, in his faded coat and battered artillery cap, was held an indispensable adjunct to all turnouts of a warlike complexion. Nor was his fame wholly local. Now and then, as time went on, some old comrade of the Army of the Rio Grande, a member perhaps of old Company K, would turn up in Rivermouth for no other apparent purpose than to smoke a pipe or so with Dutton at his headquarters in Nutter's Lane. If he sometimes chanced to furnish the caller with a dollar or two of "the sinews of war," it was nobody's business. The days on which these visits fell were red-letter days to James Dutton.

It was a proud moment when he found himself one afternoon sitting, at Schoolmaster Dennett's invitation, on the platform in the recitation-room of the Temple Grammar School—sitting on the very platform with the green baize-covered table to which he had many a time marched up sideways to take a feruling. Something of the old awe and apprehension which Master Dennett used to inspire crept over him. There were instants when Dutton would have abjectly held out his hand if he had been told to do it. He had been invited to witness the evolutions of the graduating class in history and oratory, and the moisture gathered in his honest blue eyes when a panic-stricken urchin faltered forth—

We were not many, we who stood  
Before the iron sleet that day.

Dutton listened to it all with unruffled gravity. There was never a more gentle hero, or one with a slighter sense of humor, than the hero of Chapultepec.

Dutton's lot was now so prosperous as to exclude any disturbing thoughts concerning the future. The idea of applying for a pension never entered his head until the subject was suggested to him by Postmaster Mugridge, a more worldly man, an office-holder himself,

with a carefully peeled eye on Government patronage. Dutton then reflected that perhaps a pension would be handy in his old age, when he could not expect to work steadily at his trade, even if he were able to work at all. He looked about for somebody to manage the affair for him. Lawyer Penhallow undertook the business with alacrity; but the alacrity was all on his side, for there were thousands of yards of red tape to be unrolled at Washington before anything in that sort could be done. At that conservative stage of our national progress it was not possible for a man to obtain a pension simply because he happened to know the brother of a man who knew another man that had intended to go to the war, and did n't. Dutton's claims, too, were seriously complicated by the fact that he had lost his discharge papers; so the matter dragged, and was still dragging when it ceased to be of any importance to anybody.

Whenever James Dutton glanced into the future it was with a tranquil mind. He pictured himself, should he not fall out of the ranks, a white-haired, possibly a bald-headed, old boy, sitting of summer evenings on the door-step of his shop, and telling stories to the children—the children and grandchildren of his present associates and friends. He would naturally have laid up something by that time; besides, there was his pension. Meanwhile, he would live respected and treated kindly by high and low. There were long years of this pleasant existence to be passed through before he reached the period of old age. Of course that would have its ailments and discomforts, but its compensations also. It seemed scarcely predictable that the years to come held for him either great sorrows or great felicities. He would never marry, and though he might have to grieve over a fallen comrade here and there, his heart was not to be wrung by the possible death of wife or child. With the tints of the present he painted his simple future, and was content.

Sometimes the experiences of the last few years took on the aspect of a haunting dream; those long marches through a land rich with strange foliage and fruits, the enchanted southern nights, the life in camp, the roar of battle, and that one bewildering day on the heights of Chapultepec—it all seemed phantasmagoric. But there was his mutilation to assure him of the reality, and there on Anchor street, growing grayer and more wrinkled every season, stood the little building where he had enlisted. To be sure, the shield was gone from the transom, and the spiders had stretched their reticuled barricades across the entrance; but whenever Dutton hobbled by the place he could almost see Sergeant O'Neil leaning in

an insidious attitude against the door-sill, and smoking his short clay pipe as of old. Yet as time elapsed this figure also grew indistinct and elusive, like the rest. The weeks had turned themselves into months, and the months into years. Perhaps four years had passed by when clouds began to gather on James Dutton's bright horizon.

The wisest of poets has told us that custom dulls the edge of appetite. One gets used to everything, even to heroes. James Dutton was beginning to lose the bloom of his novelty. Indeed, he had already lost it. The process had been so gradual, so subtle, in its working, that the final result came upon him like something that had happened suddenly. But this was not the fact. He might have seen it coming, if he had watched. One by one his customers had drifted away from him; his shop was out of the beaten track, and a fashionable boot and shoe establishment, newly sprung up in the business part of the town, had quietly absorbed his patrons. There was no conscious unkindness in this desertion. Thoughtless neglect, all the more bitter by contrast, had followed thoughtless admiration. Admiration and neglect are apt to hunt in couples. Nearly all the customers left on Dutton's hands had resolved themselves into two collateral classes — those who delayed and those who forgot to pay. That unreachd pension, which flitted like an *ignis fatuus* the instant one got anywhere near it, would have been very handy to have just then. The want of it had come long before old age. Dutton was only twenty-nine. Yet he somehow seemed old. The indoor confinement explained his pallor, but not the deepening lines that recently began to spread themselves fan-like at the corners of his eyes.

Callers at Nutter's Lane had now become rare birds. The dwindling of his visitors had at first scarcely attracted his notice; it had been so gradual, like the rest. But at last Dutton found himself alone. The old solitude of his youth had re-knitted its shell around him. Now that he was unsustained by the likelihood of some one looking in on him, the evenings, especially the winter evenings, were long to Dutton. Owing to weak eyes, he was unable to read much, and then he was not naturally a reader. He was too proud or too shy to seek the companionship which he might have found at Meek's drug-store. Moreover, the society there was not of a kind that pleased him; it had not pleased him in the old days, and now he saw how narrow and poor it was, having had a glimpse of the broad world. The moonlight nights, when he could sit at the window, and look out on the gleaming river and the objects on the further shore, were bearable. Something seemed always to be going on in

the old disused burying-ground; he was positive that on certain nights uncanny figures flitted from dark to dark through a broad intervening belt of silvery moonshine. A busy spot after all these years! But when it was pitch-black outside he had no resources. His work-bench with its polished concave leather seat, the scanty furniture, and his father's picture on the wall, grew hateful to him. At an hour when the social life of the town was at its beginning he would extinguish his melancholy tallow-dip, and go to bed, lying awake until long after all the rest of the world slumbered. This lying awake soon became a habit. The slightest sound broke his sleep — the gnawing of a mouse behind the mop-board, or a change in the wind; and then insomnia seized upon him. He lay there listening to the summer breeze among the elms, or to the autumn winds that, sweeping up from the sea, teased his ear with muffled accents of wrecked and drowning men.

The pay for the few jobs which came to him at this juncture was insufficient to supply many of his simple wants. It was sometimes a choice with him between food and fuel. When he was younger he used to get all the chips and kindling he wanted from Sherburn's shipyard, three quarters of a mile away. But handicapped as he now was, it was impossible for him to compass that distance over the slippery sidewalk or through the drifted road-bed. During the particular winter here in question James Dutton was often cold, and oftener hungry — and nobody suspected it.

A word in the ear of Parson Wibird Hawkins, or the Hon. Jedd Deane, or of any of the scores of kind-hearted townfolk, would have changed the situation. But to make known his distress, to appeal for charity, to hold out his hand and be a pauper — that was not in him. From his point of view, if he could have done that he would not have been the man to rescue his captain on the fiery plateau, and then go back through that hell of musketry to get the mountain howitzer. He was secretly and justly proud of saving his captain's life and of bringing off that "cursed nice little cannon." He gloried over it many a time to himself, and often of late took the medal of honor from its imitation-morocco case, and read the inscription by the light of his flickering candle. The embossed silver words seemed to spread a lambent glow over all the squalid little cabin — seemed almost to set it on fire!

Until within a year or eighteen months Dutton had regularly attended the Sunday morning service at the Old Granite Church. One service was all he could manage, for it was difficult for him to mount the steep staircase leading to his seat in the gallery. That his atten-

dance slackened, and finally ceased altogether, he tried, in his own mind, to attribute to this difficulty, and not to the fact that his best suit had become so threadbare as to make him ashamed; though the congregation now seldom glanced up, as it used to do, at the organ-loft where he sat separated from the choir by a low green curtain. Thus he had on his hands the whole unemployed day, with no break in its monotony; and it often seemed interminable. The Puritan Sabbath as it then existed was a thing not to be trifled with. All temporal affairs were sternly set aside; earth came to a standstill. Dutton, however, conceived the plan of writing down in a little blank-book the events of his life. The task would occupy and divert him, and be no flagrant sin. But there had been no events in his life until the one great event; so his autobiography resolved itself into a single line on the first page—

Sept. 13, 1847. Had my leg shot off.

What else was there to record, except a transient gleam of sunshine immediately after his return home, and his present helplessness and isolation?

It was one morning at the close of a particularly bitter December. The river-shore was sheathed in thicker ice than had been known for twenty years. The cold snap, with its freaks among water-pipes and window-glass and straw-bedded roots in front gardens, was a thing that was to be remembered and commented on for twenty years to come. All natural phenomena have a curious attraction for persons who live in small towns and villages. The weathercock on the spire and the barometer on the back piazza are studied as they are not studied by dwellers in cities. A habit of keen observation of trivial matters becomes a second nature in rural places. The provincial eye grows as sharp as the woodsman's. Thus it happened that somebody passing casually through Nutter's Lane that morning noticed—noticed it as a thing of course, since it was so—that no smoke was coming out of Dutton's chimney. The observer presently mentioned the fact at

the Brick Market up-town, and some of the bystanders began wondering if Dutton had overslept himself, or if he were under the weather. Nobody recollected seeing him lately; a person so seldom in the street as Dutton is not soon missed. Dr. Meeks concluded that he would look in at Nutter's Lane on the way home with his marketing. The man who had remarked the absence of smoke had now a blurred impression that the shutters of Dutton's shop window had not been taken down. It looked as if things were not quite right with him. Two or three persons were going in Dr. Meeks's direction, so they accompanied him, and turned into Nutter's Lane with the doctor.

The shop shutters were still up, and no feather of smoke was curling from the one chimney of Dutton's little house. Dr. Meeks rapped smartly on the door without bringing a response. After waiting a moment he knocked again, somewhat more heavily, but with like ill success. Then he tried the latch. The door was bolted.

"I think the lad must be sick," said Dr. Meeks, glancing hurriedly over his shoulder at his companions. "What shall we do?"

"I guess we'd better see if he is," said a man named Philbrick. "Let me come there," and without further words Philbrick pressed his full weight against the pine-wood panels. The rusty fastening gave way, and the door flew open. Cold as it was without, a colder breath seemed to issue from the interior. The door opened directly into the main apartment, which was Dutton's shop and sleeping-place in one. It was a lovely morning, and the sunshine, as if it had caught a glitter from the floating points of ice on the river, poured in through a rear window and flooded the room with gold. James Dutton was lying on his pallet in the further corner. He was dead. He must have been dead several hours, perhaps two or three days. The medal lay on his breast, from which his right hand had evidently slipped. The down-like frost on the medal was so thick as to make it impossible to distinguish the words—

"FOR BRAVERY ON THE FIELD OF BATTLE."

*Thomas Bailey Aldrich.*

## POET AND LARK.

WHEN leaves turn outward to the light,  
And all the roads are fringed with green;  
When larks are pouring, high, unseen,  
The joy they find in song and flight,  
Then I, too, with the lark would wing  
My little flight, and, soaring, sing.

When larks drop downward to the nest,  
And day drops downward to the sea,  
And song and wing are fain to rest,  
The lark's dear wisdom guideth me,  
And I too turn within my door,  
Content to dream, and sing no more.

*Mary Ainge De Vere.*

## ARCHITECTURE AT THE WORLD'S COLUMBIAN EXPOSITION.—V.

DRAWN BY A. BRENNAN.

JOSEPH RICHTER, SCULPTOR.

CAPITAL FOR FISHERIES BUILDING.

THE visitor, approaching from the south the district which lies between the northern and central divisions of the park, at the point where the apparently capricious and accidental windings of the Lagoon find their northern connection with the lake, will presently catch glimpses of certain long stretches of roof, gaily broken by towers and decorated belvederes, rising above the skirting shrubbery and wood-growth of the shores, and suggesting the hidden luxuries of a "stately pleasure house," decreed by some Kubla Khan of Oriental romance. As he advances nearer, he will discover that this romantic pleasance is accessible from the south by a bridge spanning the waters of the canal, or estuary, connecting the Lagoon with the lake, the architectural masses will become coherent and symmetrical, and finally he will learn from unmistakable characteristics that the Fisheries Pavilion lies before him. This pavilion is set in the axis of the Liberal Arts Building extended northward, and between the two buildings in the same axis rise the masses of the great structure built by the United States for the Government exposition.

Apparently the architect, Mr. Henry Ives Cobb of Chicago, in preparing his preliminary studies for this interesting exhibit, finally arrived at the conclusion that, in respect to his plan, its general form must be largely controlled by its adjustment to the shape and limited area of the irregular stretch of shore which he was to occupy with his water-front, and, in respect to his elevations, that they should rather affect

playfulness than formality in outline, so that they might be in more natural relations with their environment; at the same time, the connection established by the main axial line between his building and those composing the Court, the proper classification and arrangement of the collections which he was to accommodate, and the dignity and importance of the task assigned him, seemed to impose a symmetrical treatment both on plan and elevation. In this case it was the good fortune of the architect to have to deal with a department of the Exposition which invited a treatment almost as characteristic as that of the Horticultural department, which had the type of the glazed conservatory as its point of departure. Marine life seemed to suggest to the architectural mind types of form nearly as marked, while all the other great buildings had to be based more or less on the conventional idea of a palace or office of state, depending rather on their details of decoration than on their general features of structure to indicate the purposes for which they were built. This statement is especially applicable to the formal Renaissance buildings around the Court; but even those outside of the Court, like the Mines and Transportation pavilions, which were more free to adopt forms characteristic of service, could hardly confess their objects so clearly as the two buildings which we have noted.

The architect found that his site would be most conveniently occupied by a compact mass

DRAWN BY A. BRENNAN.

JOSEPH RICHTER, SCULPTOR.

CAPITAL FOR FISHERIES BUILDING.

of building hardly larger than 365 feet in length by 165 feet in width; but as this was insufficient for his exhibition, he set aside two distinctive divisions, the aquarial and the angling divisions, to be accommodated in separate pavilions, connected with the ends of the main structure by one-storied corridors, so curved forward in plan that the main frontage should seem to be set back between the two smaller buildings. Thus arranged, the main façade faces southward toward the Government Building, and, being closely connected with the shoreline of the estuary, the whole pile assumes the characteristics of a marine pavilion.

Mr. Cobb found that the most convenient unit of dimension in his construction was 20 feet, and, following the simplest and most obvious arrangement for lighting the interior spaces, he planned to provide for a lofty central hall illuminated by a range of clearstory windows and surrounded by lean-tos, or aisles. To the width of this hall he gave four of his units or modules (80 feet), and to the length fourteen (280 feet), thus leaving for the width of his surrounding aisle, or lean-to, two modules, or 40 feet. The entire area found practicable for the main building was in this way fully occupied. A very characteristic feature was imposed upon his exterior forms by the fact that, unlike the other buildings, two full stories were not required in order to obtain the requisite floor-area. Allowing only one module for the height of his aisle-story, he obtained for the outside walls, including a stylobate, or basement, of  $3\frac{1}{2}$  feet, a height limited to 24 feet. This frontage, exceptionally low in comparison with the large area of the building, made it necessary to give to the roofs a pitch sufficiently steep to bring them into the design, and to make them important features in the composition as a whole. A proportionate height for the clearstory walls was found by experiment to be 14 feet, and above this the upper roofs, sloping at the same angle as those below, reached a total height of 65 feet from the floor. In this natural way the exterior expression of the building, distinguishing it from all the other structures of the Exposition, became one of roofs and clearstories. The area in the triforium space under the slope of the aisle roofs being required for exhibition purposes, access to it is obtained by projecting the floor of the triforium, or half second story, into the nave area far enough to form a gallery, or balcony, all around on that level, approached by staircases grouped near the center of the building. The architect thus obtained a mass of building composed of a comparatively low wall, from which roofs sloped steeply to a central ridge, interrupted only by the clearstory of the nave. The conditions clearly demanded an important

culminating feature. This he obtained by erecting in the center of his nave a great circular tower, of which the diameter is equal to the whole width of the nave (80 feet), and by providing it with polygonal turrets at the corners to mask the awkwardness occasioned by the passing of a round tower through the slopes of the nave roof. These turrets he arranged to contain staircases, by which access is obtained to an exterior and interior gallery, or balcony, boldly projecting at the level of the apex of the nave roof. Above this he established a high clearstory stage still accompanied by the polygonal towers, and, following the roof-motive of his design, he covered his rounded tower with a steep conical roof, crowned with an upper balcony and a delicate belvedere, which he repeated on a lower level in finishing his four polygonal turrets. The total height thus obtained is 150 feet. To provide for the main entrances it remained to project transepts 80 feet wide from the tower to the center of the long fronts and thence 40 feet outside the walls of the aisles. These transepts preserved the lowness of effect characteristic of the rest of the buildings, by continuing around them the aisle walls, and covering them with pitched roofs without clearstories. The fronts of these transepts are flanked by low polygonal barbican towers belonging to the same family as those already mentioned.

The architectural character of the two separate pavilions is fixed by the results of the study of the unusual conditions involved in providing for the department of aquaria, to which that on the right of the main building is devoted. The fortunate outcome of this study is a polygonal building 60 feet in diameter and 67 feet high, with a windowed clearstory, all arranged in plan and elevation like an Italian baptistery or English chapter-house, with a glass-roofed aisle 37 feet wide, carried around it in the form of a lean-to, exactly as in the main building. A fountain is provided in the circular central hall, which opens into the aisle by an arcade. The aisle is divided into three concentric divisions forming annular spaces encompassing the circular chamber. Of these the middle one is made a vaulted passage, with a groined ceiling supported by columns and arches, corresponding to those separating the central circular chamber from the aisles. The other two annular spaces on each side of this passage are occupied by the aquarial tanks. All these arches on both sides of the passage and in the central chamber are glazed from top to bottom with transparent glass, the lower eight feet, with polished plate, forming the walls of the aquaria, the rest with decorative glass stained with marine tones. In these aquaria the architect has provided for the display of salt-water

FINE ARTS BUILDING.

CHARLES B. ATWOOD, ARCHITECT.

and fresh-water fishes and every form of marine life. The only light which will reach the vaulted passage will pass through the glazed walls of the tanks, and the visitor, in making the circuit of the building through this passage, will seem to be walking dry beneath the water, with all the secrets of the great deep betrayed to him on each hand, according to the systems in use in some of the greater marine museums in the Old World.

The angling pavilion on the other side naturally assumes the same exterior character, and both closely follow the motives of the greater building, which are based very frankly on Southern Romanesque, the outer walls everywhere being formed with a continuous open arcade, the round stilted arches of which are supported on small round columns coupled in the thickness of the wall, as in a cloister. There are three of these arches to each 20-foot bay. Between the coupled columns passes a continuous perforated balustrade, and the building is inclosed by a glazed screen behind this arcade and clear of it. The treatment of the clearstory walls corresponds to this, but with five arches to each bay, and the great clear-story of the tower has a loftier and richer arrangement of arches with grouped jamb-shafts, mullion-shafts, and Romanesque tracery. All the cornices are corbeled according to the style. The Romanesque arcade appears also as the decorative feature of all the belvederes and towers. The only variation made in this arcade treatment to give dignity to the main entrance is to advance slightly from the face of the transept a highly decorated triplet of larger arches covered with a gable, whose outline the architect has enriched with crockets in the form of fishes. The tympanum inclosed by the gable will be occupied by a bas-relief representation of the most heroic business done by fishermen on the great deep—the capture of a whale. Very properly Mr. Cobb has borrowed from marine life the decorative details of his capitals and of the columnar shafts of his porches, and there is nothing in the familiar but inexhaustible range of conventional Romanesque ornament, as applied to this building,

But doth suffer a sea-change  
Into something rich and strange.

Fishes in every form, crabs, lobsters, water-snakes, frogs, shells, and the infinite algæ of the great deep, are grouped to decorate capital and corbel, but always so massed as to preserve the characteristic outlines and functions of the architectural members. Under the immediate direction of the architect, Mr. Joseph Richter of Chicago has in this way composed from sixty to eighty models of capitals, corbels, and shaft

ornaments, each differing from the other in the idea which it conveys, but all loyal to the conventional type. The Romanesque of southern France and northern Spain, even in the religious buildings, is distinguished by a semi-barbaric humor expressed in grotesque and caricature. There is therefore no unnecessary audacity of imagination in the playful treatment of the details of the Fisheries Pavilion; it not only brings it into harmony with the spirit of the style, but serves to make it joyous and festive without loss of dignity, grace, and fitness.

The whole building shows clearly enough how the modern architect can, on the one hand, use precedent with loyal intelligence, but without being enslaved by it; and on the other, how, when occasion requires, he can be original without going through the superfluous and dangerous process of inventing a new language in which to express himself, as is the custom with the unlettered and the untrained.

AFTER much controversy and many changes of plan and site, the department of Fine Arts found its most appropriate position near the middle of the northern division of the park, surrounded by the smaller pavilions which are to form the headquarters of the several State commissions, and by those to be erected by foreign governments.

This building, the design of which was prepared by Charles B. Atwood, the designer-in-chief in the Bureau of Construction, was practically confined by conditions of site and cost to a frontage of 500 feet, facing north and south, and to a depth of 320 feet, with opportunities for lateral extension by detached wings, connected with the main structure by galleries of communication. It was to be strictly fire-proof, and on this account was carefully isolated. Through this isolation it was freed from the necessity of submitting to concessions for the sake of harmony with neighboring buildings, so that, surrounded by ample grounds dedicated to art, its form and character as a symmetrical monument could be freely developed.

In formulating the plan, it was found convenient to adopt a decimal module of proportion. In the beginning it was evident that the scheme

DRAWN BY ALEXANDER SANDIER.

AN INTERIOR VIEW OF THE DOME OF FINE ARTS BUILDING.

would be fundamentally affected by the fact that the area was to be occupied, not by one great hall with continuous floor-space, as was the case with all the industrial buildings, but by a series of halls or chambers; and that of these there must be two divisions, one set devoted to the exposition of sculpture and the plastic arts, requiring conditions of area, shape, height, and lighting different from the other set, which had to be arranged for the accommodation of paintings, drawings, and engravings. The former called for ample uninterrupted floor-space, indefinite height, light from above so diffused as to avoid, as far as possible, conflicts of shadows and confusion of reflections, and, in general, a largeness and nobility of aspect entirely consistent with monumental architecture in its highest sense. On the other hand, the galleries of chambers for the exposition of

paintings and drawings needed not to be more than 30 feet in width, and demanded clear wall-spaces not more than 20 feet high, with coved ceilings raising the ceiling skylights 10 feet higher, so that the wall-surfaces might have

plan, pierced in the axes of the central halls with lofty arched openings, thus dividing the supporting walls into four masses of masonry, so disposed as to give passageway between nave and transepts outside of these piers, to

W. J. EBBROOKE, SUPERVISING ARCHITECT, TREASURY DEPARTMENT.

DRAWN BY F. LEO HUNTER.

UNITED STATES GOVERNMENT BUILDING.

noshadows. A decorative or architectural treatment was not invited. The halls of sculpture, therefore, being the widest, highest, longest, and most architectural, were the arteries of the system, to which all the other members, being lower, smaller, and simpler or more purely utilitarian, had to be distinctly subordinate. The architect, therefore, placed the former in the main axes of his plan, arranging them in the form of a central longitudinal nave, 500 feet long, 100 feet wide, and 64 feet high to the cornice, crossed in the center by a transept 340 feet long, and of the same width and height. These he provided with skylights and clear-story, and with a wide balcony, giving circulation around the entire system at a higher level, and accommodation for bas-reliefs and minor objects of the fictile arts, while the larger works of sculpture and modeling were to occupy the main-floor areas. The outer ends of nave and transept in the center of each façade naturally became porches with vestibules of noble preparation and ceremony. It was also inevitable that the culmination of interest externally and internally should be in the center of the building at the crossing of the great halls. In the hands of the architect this feature took the form of a noble domical chamber, 155 feet high externally and 128 feet high internally, with a diameter of 72 feet. This dome he supported on a massive substructure of octagonal

avoid the necessity of making this central hall a thoroughfare. Still further to dignify it as a place which should be not a mere passageway between adjoining halls, but where the more conspicuous objects should be gathered for especial honor, as in the tribune of the Uffizi Palace, he placed two columns of his main order in each opening, supporting an entablature across it on the line of the impost, with statues above, as was often done in the Roman baths and basilicas, so as to form an open screen. By this great central feature the sculpture-halls are divided into two long and two short courts.

Doors on the sides of the longer courts give access to the ends of a series of twenty-four picture-galleries, which are made of the standard height and width of 30 feet, and 60 feet long, thus affording for each gallery about 2500 feet of wall-space available for hanging, this being a convenient unit for dividing the collection into groups according to character or nationality. At the outer ends of these transverse galleries, opposite doors open into larger longitudinal intercepting galleries, about 40 feet wide, forming the envelop of the building. At one end these longitudinal galleries communicate with the shorter or transverse courts of sculpture, and, at the other, with corner pavilions, 50 feet square. In this manner nearly 100,000 square feet of hanging-space are ob-

tained in a series of communicating galleries, so contrived as to facilitate classification, and the parallelogram of the plan is completed, becoming compact, articulate, and orderly, justifiable by considerations of circulation, economy of space, convenience, and construction, and, as we shall presently discover, leading directly to a symmetrical disposition of exterior masses, which will compose architecturally with dignity and elegance, and without the necessity of having forced upon them any feature of importance not already suggested by the structure itself.

As regards the exterior, the objects of this building seemed very clearly to invite a monumental expression, set forth in terms connected with the evolution of the highest civilizations in history, associated with the greatest triumphs of art, established by the usages of the greatest masters, and formulated by the schools and academies of all nations. It was necessary that it should be pure, formal, and stately, entirely free from caprice or playfulness, refined by scrupulous elegance of detail, and enriched by every device of decorative sculpture which could be consistently recalled from historic art, so that, when completed, it should be fit to enshrine the figures and groups in marble and bronze, the paintings in oil, water-color, and fresco, the carvings in ivory, wood, and marble, the bas-reliefs, engravings, etchings, and drawings, by which the century is taking its rank in history. It is evident that any design not strictly ordained by academic principles and practice, any design indebted to semibarbaric or romantic precedents, impressed with personal idiosyncrasies, or in any way experimental, would, under the circumstances, be out of harmony with the purposes of the building. Indeed, the building itself should be in sympathy with its contents, and as nearly all dogmas of modern art are more or less directly derived through pagan, Christian, or Renaissance experience from classic models, it was evident that the shrine which was to contain them, if Greek in character, would respond to every mood and principle of artistic expression.

The scheme of this building, as already outlined in plan developed in block-elevation, is an extensive parallelogram of flat-roofed sky-lighted buildings, about 47 feet high, raised upon a continuous basement 9 feet high, and emphasized at the corners by projecting pavilions 50 feet square and of the same height as the rest; while, above this low-lying mass, the clear-stories and roofs of the central, longitudinal, and transverse courts clearly detach themselves in long level sky-lines, generating in the middle of each façade some form of boldly projecting entrance-porch, and, at the crossing of the courts in the middle of the plan, culminating in a domi-

cal feature, which must be made about 155 feet high from the ground in order to be adequate to its functions.

Of course the arrangement of plan in any building, however utilitarian, when developed in elevation, is capable of some degree of architectural expression, either symmetrical or picturesque, as the conditions may invite; and this expression must be based upon considerations of structure and usage. Thus, even the most uncompromising of structural forms, as a grain elevator, or a block of commercial buildings, by decorative treatment may be elevated into a work of art without impairing any of its characteristic functions of utility. But, in laying out his scheme, the architect cannot but mentally anticipate its ultimate appearance when built, and naturally prefers those alternative arrangements of plan which are most capable of architectural effect. So in the present building, Mr. Atwood, in composing his plan, did not permit himself to be embarrassed by unnecessary difficulties in exterior expression through want of prudent foresight. It was hardly by accident, therefore, that the combination of masses which we have seen taking shape lent themselves to what might be called a Renaissance development of pure Greek forms. In considering the conversion of these prosaic masses of utility into the poetry of art, the architect assumed as his key-note the beautiful Ionic of the portico of Athena Polias in the Erechtheum, as suggesting a degree of refinement and elegance of detail less redundant but more exact than the Corinthian of the Choragic monument of Lysicrates, less chaste and severe than the Doric of the Parthenon, but happily combining the qualities of both. Unlike any of the buildings which we have been considering, no light is derived through the outer walls (these being the walls of picture-galleries), which, therefore, structurally must be left plain. To obtain a play of light and shadow upon these windowless surfaces, and to make them interesting, the architect, following the Greek method of placing in front of the plain cella walls of the temples a screen, or peristyle, established an Ionic colonnade about 8 feet from his walls, composed of columns 27 feet high, set 10 feet on centers, and resting on the basement, or stylobate, of which we have spoken. Thus a continuous loggia, or sheltered ambulatory, is formed, extending between the bold projection of the central porch on each front and the slighter projection of the corner pavilions, giving to the long curtain-walls a decoration entirely classic in character.

The main entrance in the center of each long front is architecturally distinguished by what is technically known as a *tetrastyle portico in antis*, that is, a portico of four great Ionic columns, 40½ feet high, set between two three-quarter

columns built into the jambs of a great opening pierced in the projecting outer wall of the sculpture-court, thus forming an open screen in front of a deep vestibule. This portico is approached by a noble flight of steps with a statue of Minerva in the center thereof, and over this portico is placed an attic, of which the pilasters, corresponding to the columns below, are faced with caryatid figures or telamones, 14 feet high, like those in the clearstory of the Greek temple at Agrigentum, thus bringing the upper cornice of the portico to a height of 73 feet, the whole attic being continuous with the clearstory of the courts, and securing an important bond of architectural unity for the composition. This portico is finished with an enriched pediment, which serves as the decorative expression on the façade of the pitched roof of the courts. Just above the point where these court-roofs abut against the square substructure of the central dome a simpler form of pediment is repeated, this being the external development of the interior columnar entrances to the central domical hall or tribune, to which we have already referred. Above these pediments the square substructure of the central feature finishes with a cornice and crest, preparatory to the round drum and low dome which crown the whole mass. A corresponding but inferior portico, with only two columns *in antis*, is established for the center of the end façades.

The marked predominance on the principal fronts of a boldly projecting portico 73 feet high (representing the courts), while on each side of the portico are long stretches of colonnades only 56 feet high (representing the picture-galleries), was found to be too great, giving a transition too sudden from high to low. This difficulty of composition the architect ingeniously remedied by flanking the mass of this portico with two pavilions of intermediate projection about 30 feet wide, to correspond with the divisions of the plan. These pavilions he made of the same height as the galleries, and faced them with small caryatid blank porticos, suggested by that of the Erechtheum. Behind these pavilions, in the four internal angles formed at the junction of the longitudinal and transverse courts, are circular staircases, giving access to the system of balconies around these courts. The domes covering these staircases are so developed externally as to perform a similar service of preparation at the corners of the square substructure of the great central dome. The corner pavilions the architect decorated with flat pedimented porticos, and the light iron colonnettes supporting the interior balconies and the roofs of the courts are modeled after suggestions in the painted architecture on the walls of Pompeii.

It is a part of the scheme to make the numerous statues, friezes, and other decorations,

in the round and in relief, replicas of the greatest masterpieces of Greek and Renaissance art, so that the building itself shall be a museum, not of historical sculpture only, but of painting.

It is fortunate that the opportunity of presenting in this building a monument which internally and externally should be a specimen of serious and elegant academic architecture has been improved in a manner so scholarly and so loyal to traditions. We present this composition in geometrical elevation and plan, so that the eye may at once perceive how exterior and interior have grown together, the former becoming an architectural expression of the latter, and the latter yielding no point of convenience or economy to adjust itself to any preconceived theory of design. The whole is an artistic organism, delicately poised, in which use and beauty find themselves in a condition of perfect harmony.

There is no building on the grounds which we should more regret to see destroyed at the conclusion of the Exposition than this beautiful monument. Its essential structure is, as we have seen, fire-proof; only its porticos, its peristyles, and its exterior decorative details are temporary. These could be so readily replaced by permanent construction in the same form, that the architects of all the buildings hope it may be permitted to remain as the most appropriate and worthy memorial of the Exposition of 1893.

WE have seen that the Fisheries Pavilion, with its tentacle-like arms, is closely nested in the indentations of the northern margin of the estuary which connects the waters of the Lagoon with the lake. On the opposite side of this estuary is the northern or water front of the United States Government Pavilion, the longitudinal axis of which, extended northward, passes through the center of the Fisheries Pavilion, and, extended southward, forms also the longitudinal axis of the immense palace of Manufactures and the Liberal Arts.

By this axial system the group of buildings on the lake-side is architecturally allied with the main groups around the great basin and its connecting canals, the Transportation Building, on the shoreward side of the Lagoon, having corresponding relations with them. The largest and most important structures of the Exposition thus have a mutual correspondence, which is of the utmost value in the expression of dignity and purpose. The other great pavilions (the Horticultural, the Woman's, the Illinois State, and the Art buildings) are ranged with the lines of city avenues and streets on another axial system. But this divergence of lines is masked by the interposition of the Lagoon, with its wooded and winding shores.

In the Government Building the departments of War, Agriculture, and the Interior, and the National Museum required each a space of about 20,000 feet; while the National Fisheries Commission, the Post-office, and the departments of State, Justice, and the Treasury, with the other public offices, each demanded spaces varying from 18,000 to 1600 feet. These departments combined demanded about 148,000 feet of floor-space, with considerable additional accommodation for offices of administration, and special collections in galleries. These considerations dictated for the building a length of 420 feet on the axial line, to which we have referred, and a width of 350. The naval exhibit is to be held in a separate structure, built in the lake, east of the National Building, on the exact model of a first-class modern armored battle-ship, fully equipped and manned, lying alongside a mole extended from the shore. The level area between the building and the lake provides outside accommodation for a model marine hospital, for the apparatus and daily exercise of a life-saving station, for a naval observatory, for the experimental plantation and irrigation exhibit of the Agricultural Department, and for the parade-ground of an encampment of United States troops. The Lighthouse Board has its exhibit at the end of the pier of which we have spoken.

For the main building of the Government exhibit the supervising architect of the Treasury Department, Mr. W. J. Edbrooke, conceived a structure occupying the entire area of which we have spoken in such a manner as to obtain a vast uninterrupted hall, in which whatever subdivisions might be required should be effected by partitions having no structural significance. By six ranges of columns set 25 feet on centers he secured support for seven parallel longitudinal aisles, each 50 feet wide, of which four, including the outer aisles, are high, with pitched or gabled roofs, and the other three, alternating with these, are low with segmentally arched roofs, over which the high aisles obtain a well-distributed light throughout the interior by a range of clearstory windows. These longitudinal aisles are crossed transversely in the center by a higher transept, consisting of a nave, or main hall, 40 feet wide, flanked by double 20-foot aisles.

From a decorative point of view, it was evident that a lofty central, culminating feature must be introduced, of sufficient importance to confer peculiar distinction upon an architectural composition which must stand among the other buildings of the Exposition as an adequate representative of national dignity. The architect, therefore, built in the center of this

complex of longitudinal and transverse roofs a dome 120 feet in diameter and 25 feet high from the floor, so that it should dominate the wide-spreading and comparatively low-lying mass of the building from every point of view. Below the roofs this domical structure appears in the middle of the great hall as a central octagonal tribune, or chamber, of which each side, 50 feet wide, is pierced by an arch; above the roof it assumes the form of a sixteen-sided drum, or podium, decorated on each face with an order of coupled arched windows between pilasters, from which spring the ribs of a dome 78 feet high, embellished by lucarnes. A lofty lantern completes the upward movement of the sky-lines, and a corbeled, aerial balcony is introduced as the base of the lantern to give animation and lightness to this most sensitive part of the design.

The architectural character of the inclosing walls of the building must of course depend upon the skill with which the architect has made use of the suggestions of the general plan. The requisite height for a great hall 420 by 350 feet, with galleries across the north and south ends and in the aisles of the transept, gives 45½ feet as the general height of the façades, above which is placed a balustrade to mask the roof-system. We have seen that the loftiest part of this roof-system is in the transept. This feature compels recognition in the central pavilions of the long east and west fronts, which become the principal portals of the building. Each of these pavilions is composed of five members or divisions, corresponding in position and width to the transept and its two aisles on each side. The three central divisions are carried 30½ feet, and the two outer divisions 6 feet, higher than the main cornice. All finish with level sky-lines, but the three middle divisions are crowned, the central one by a typical group of figures, and the other two by national eagles mounted on octagonal pedestals. The idea of the portal is adequately expressed by a central arch, occupying the whole width of the transept, and springing from the level of the main cornice of the building, which is continued across all the pavilions as a string-course.

The structure and dimensions of the outer longitudinal aisles developed in elevation produce a curtain-wall in four 25-foot bays, coincident with the spacing of the columns within, each bay being treated with a great arched window, divided horizontally by a transom or string-course, corresponding with the level of the interior galleries and continued all around the façades. These bays are separated by buttress-piers of slight projection, and on each angle of the building a corner pavilion, 50 feet square, covered with a low square dome, is nat-

urally evolved from the conditions of the plan. Each front of these corner pavilions has a glazed arched opening set between two narrow subordinate pavilions. On the north and south fronts the gable-ends of the longitudinal aisles produce an architectural composition wherein the three central aisles are expressed in a boldly projecting triple entrance-pylon, carefully subordinated to the main entrances on the east and west fronts, the outer aisles in two corner pavilions, and the intermediate lower aisles in a correspondingly depressed frontage 50 feet wide, covered with an ornamented segmental gable, following the roof-lines. Thus it will be seen that the main features of the façades are the direct decorative or architectural expression of the plan, and the design, as a composition of masses, is articulate and reasonable.

The Government architectural office, which designs and constructs more great buildings than any ten private architectural offices in the world, can accomplish its prodigious work only by traditions which are the result of organization and discipline. These traditions have assumed form, more or less definite, under the administration of a succession of supervising architects, who, having found it physically impossible to give to each of the forty or fifty public monuments always simultaneously developing under their charge the study and thought necessary to a work of art, have been constrained to establish formulas of design by which, with the assistance of intelligent and trained subordinates, work might be produced which, if necessarily cold and conventional, should at least be orderly and have the merit of correctness. The characteristics of most of our national buildings may be explained by the conditions under which they have been designed, and therefore no one thinks of regarding them—as the corresponding structures in other civilized nations are regarded—as the highest and most deliberate expressions of national genius in architecture. They are big, costly, and, for the most part, soundly built of the most perfect materials, and with the best workmanship; but with some few exceptions, it has been practically impossible for them to exhibit those qualities of refinement, beauty, and fitness which can come only from special artistic study, and from that sort of inspiration which results from taking pains. They represent our talent for organization, but not our talent for art. The efforts of the American Institute of Architects to obtain legislation whereby the designs for Government buildings may, by direct selection, or by some adequate and just method of competition, be thrown into the hands of the best architects of the country—as is the case among other civilized nations—should, for these reasons, have the warm sympathy

and coöperation of all who desire to see this great nation take its proper rank in the history of architecture. Until this is done, our national monuments will continue to be significant rather of our wealth than of our art.

The present architect of the Treasury Department, handicapped, as he is, by prodigious preoccupations and responsibilities, is to be congratulated on what he has been able to accomplish in the architectural outlines of the Government Building. We have seen that its main features are coördinate in plan and elevation; that a well-ordered project has been outlined with every proper regard for symmetry, for lighting, for economical structure, and for the due relation of important to inferior parts; and that as a whole the masses are well balanced. The design is based on Renaissance formulas, but, in respect to detail, when compared with the other buildings of the Exposition in the same style, it will be found to have the true Government stamp. The mind of the master has dictated successfully the general scheme, but the detail, in its facile but crude invention, in its profuse but unimaginative use of conventional phrases and symbols, betrays the fact that it has been developed officially and without the benefit of the master's honest and patient study. The fruits of such study, in the designs of most of the other buildings, which unavoidably challenge comparison with it, are visible in their intelligent respect for historical precedent, and in their knowledge of its proper use in the evolution of modern work, in the refinement and purity of their lines, in the clearness and delicacy of their expression, in their reserve of power, and in the fastidious conscience which has patiently chastened and corrected, has been prodigal of labor in rejecting and amending, and has thus made the work sensitive, elegant, and scholarly. The design of these buildings developed slowly in what Matthew Arnold would call an atmosphere of "sweetness and light." In fact, the organized division of labor in the office of the Government architect must of necessity be fundamentally inimical to the cultivation of true artistic feeling. The work which has resulted, with some few notable exceptions perhaps, constitutes a class by itself, peculiarly mechanical and automatic in character, and, for the most part, destitute of that sort of interest which comes from individuality of expression, and from studious adaptation to conditions of use, site, climate, materials, and environment. This official administration of design, whereby the public work is turned off with the most businesslike expedition, has played no unimportant part in the creation or encouragement of a certain architectural vernacular in our country, through the baneful imitations of untrained architects in private

practice. This vernacular will continue to be a reproach to us until the true artist has had opportunity to express himself in our public monuments with the same deliberation which he has shown, and is showing, in his private work, and thus to create a school for a more healthy cultivation of style. Whatever qualities of individuality may have characterized and given interest to the private work of the Government architects, before and after they have taken upon themselves the burden of this office, these qualities have almost invariably disappeared while under the powerful influence of the Government system. These gentlemen have been like the Greek artists, who lost their peculiar and delicate power when they became the servants of Roman masters. They have been compelled to content themselves with the show and not the substance of art, and to acknowledge as their own a succession of cold and formal official monuments, in which the smallest amount of design has to do the largest service by unimaginative but costly repetitions, and which differ one from the other only by reason of the amount of the appropriation in each case, and, to a certain extent, because of the difference in their requirements, not according to the personal quality of the architect who has given to them the respectability of his name. He has laid aside his function as an artist, and has become a creature of politics, of administration, of classifications, and of formalisms.

If our Government could place the designing of its buildings in the hands of architects

who have proved their ability to do justice to such great opportunities for professional distinction, the art of architecture would not only receive the encouragement which is due to it from one of the most enlightened nations of the world, but our public monuments would at last adequately express our civilization. In England, in France, in Germany, and, indeed, in all the great European countries, the public buildings are their highest and most characteristic efforts in art. It is the ambition of every architect to make himself worthy to be employed upon them. They constitute the great prizes of the profession. We cross the Atlantic to see the cities which they have made beautiful. In our own country enough of treasure has been appropriated for national buildings, and spent on them, to make our cities equally noble and attractive. But under the present system these opportunities have been worse than lost; for they have encouraged an unnecessary extravagance of expenditure without adequate return, and they offer no higher type to be accepted as the expression of our civilization than respectable conventionality and organized commonplace.

If the suggestive contrasts of quality in the buildings of the Exposition should serve no higher purpose than as an object-lesson to our legislators, teaching them that their responsibilities in respect to our national architecture are not properly discharged by maintaining a costly architectural factory in Washington, the unsubstantial pageant of Jackson Park will not have been in vain.

*Henry Van Brunt.*

## THALASSA.

O BEST beloved, give me of thy rest!  
 If I might lay my worn and aching frame  
 Along the hollow of thy mighty hand,  
 Where now thy pliant fingers grip the land,  
 Or feel the snow-white summits of thy breast,  
 Fair as the three-formed hutchress maiden's fame,  
 Rock slow beneath me, slow and deep and strong,  
 Keeping the rhythm of that old cradle-song  
 The morning stars sang to the infant world—  
 Then would the lids of sleep drop down unfurled,  
 And I should slumber in enchanted ease  
 Between thy serrated infinities,  
 As on the airy bosom of the west  
 Sleeps yonder star, a nursing of the skies.  
 Thalassa! thou art the incarnate rest;  
 In thy great heart immortal stillness lies.

*W. J. Henderson.*

## THE VILLAGE ALIEN.

AN August sun was beating down on Strathboro'. The little town wore a strange aspect. An intelligent bird, coming from afar, and flying over houses, yards, and gardens, might have realized something curious in the look of things.

The square surrounding the court-house and lined with shops was utterly deserted; the shop-shutters were generally up, and the court-house, which had no shutters, showed the need of them in many a shattered pane of glass, which gave it an air of degraded desolation. Both in the square and beyond, grass and weeds overgrew, in a disorderly, squalid way, many an unaccustomed spot. The ample gardens behind the houses were oftener a tangle of luxuriant untrained growths; the asparagus-beds flung out their feathery foliage in great spreading masses, and against them the ironweed and ragweed and Jamestown-weed grew tall and lusty, and among these climbed wild morning-glories. At one side, perhaps, would be a little patch of cultivated ground, where a few sweet-potatoes and a little corn took up most of the room.

Not a man was to be seen anywhere, but now and again a sunbonneted woman, or several sunbonneted women together, would pass from one house to another.

Inside the houses, or on their shaded galleries, groups, still altogether feminine, were gathered, talking with an air curiously uniting listlessness and restlessness, apathy and anxiety.

The truth was, they had special immediate cause for fear, but they suffered so long and so much in similar ways, that in many the capacity for keen feeling was blunted. Yet they would have told you that they suffered none the less because they suffered dully.

It was in 1863. The Federal forces under General Paine were in possession of this part of Tennessee, and their headquarters were at Tullahoma, not fifteen miles away.

Strathboro' had been well stripped of men for many a day, even the fourteen- and fifteen-year-old boys were away fighting; but until this morning a few male persons were to be seen about, and though usually they were old or sick or deformed, the sight was a comfort to the weary eyes of the womankind. Rightly or wrongly, they now involuntarily felt as never before the superiority of the dominating sex; it was they who were fighting out this war, and even the least awe-inspiring man represented

the power that carried Fate in its hand. And now, to-day, here they were, left without a man—a white man, that is—in Strathboro'. No, not literally without one; Uncle Billy Caldwell, aged eighty-two, still sat at home in his big chair, quivering and bewildered, and Blossier, the Frenchman, was also left behind.

This peculiar state of things was brought about by General Paine in his efforts to stop sudden rebel raids upon his bridges, railroads, and telegraph-wires. These attacks were always made, and the offenders gone, before punishment could reach them, and, under fresh provocation, General Paine had conceived the idea of holding the few remaining and helpless male citizens of Strathboro' responsible for the doings of the soldiers he could not catch. So, this morning an armed squad had descended upon the disheartened little town, and had marched off to Tullahoma the lame, the halt, and the blind. Falstaff's army was a robust body compared to this handful of mutinous spirits.

Uncle Billy Caldwell was not only eighty-two, but he weighed nearly three hundred pounds; if taken, he was obviously sure to die on the way, and that would inevitably cause some delay and inconvenience, so it was plainly discreet that he be left behind: but as to the Frenchman, there was no logical reason for the leniency shown him; it was simply that the Anglo-Saxon conquerors had, in common with the Anglo-Saxon conquered, so deep a feeling of his foreignness that he seemed outside of humankind. The question of taking him to Tullahoma was dismissed with a grin, as it might have been had it referred to one of Uncle Billy's ancient hounds. But old Blossier himself, naturally, took no such view of the matter. He understood English very imperfectly, but he believed that France was honored in his person; and he had his ragged straw hat pressed to his bosom as he bowed low to the officer in command, before beginning to express, as best he could, between the two languages, his gratified sense of their regard for *la belle France*, when lo, he raised his head, and officer and men were gone, hurrying, backs toward him, up the street!

Strathboro' people would have considered old Blossier crazy if they had not felt, obscurely, that such an opinion included an admission that he had once been sane—an admission so unthinkable that they contented themselves with explaining everything on the ground that he was a Frenchman.

Yes, he was a Frenchman; that was still clear to even his poor confused brain, though little else autobiographical was. He was not old in years, not much more than forty, but the adjective was more than an epithet: it was descriptive of his relation to life. How he had drifted to Strathboro' he would have found it hard to tell. He had dim memories of barricades and dangers, and swelling emotions in his youth, and he cherished them, and around them gathered vague sentiments of patriotism that still stirred within him at the mention of France and of liberty; but the changes of the years had been too much for his powers of synthesis. He had been hustled through too many and too varied scenes; he could not untangle the coil of memory; he was confused; he gave it up; he lived on from day to day.

For five years he had so lived in Strathboro'. He maintained himself by doing odd jobs of many kinds, nursing the sick, laying out gardens—particularly flower-gardens—and tending them, mending furniture, painting indoor woodwork, making odd toys—children particularly adored them. In fact, he did all these things and others uncommonly well, else, in this slave-owning community, he would have had nothing to do. He never had much, and the war had not increased his income; but he lived, somehow, in the queer little hut he had built himself in a worn-out, abandoned field at "the edge of town," and he had so far redeemed a portion of the exhausted land as to have a flourishing bit of garden at his door, which of course was a great help for the summer. He did not return in kind the good-natured, curious contempt Strathboro' felt for him. No, in his muddled way he was cosmopolitan, and felt for his neighbors a regard that in some cases was almost affection; and now to-day as he stood in the middle of the old turpentine and watched his feeble and saddened fellow-townsmen as they started with their armed escort upon their long, hot march, his heart yearned with anxiety for them. He had nursed Mr. Paten through that spell of typhoid fever that had left him so weak; he remembered Jimmie Pembroke's broken leg, never properly set, and how much walking always started it hurting; he looked up at the lofty head of old Judge Caldwell with pitying awe, and wondered how the soldiers could thus humiliate dignity and worth: but it was when his eye turned back to the hollow-eyed, staring women, hanging over gates, and out of windows, and forth from gallery steps to see the last of the prisoners, that his feelings choked him. He alone was left to care for them.

In after years this whole incident took a humorous tone in Strathboro' traditions, but the comical side of it was pretty well lost sight

of at the time. Several citizens, on suspicion of aiding in the depredations of soldiers and bushwhackers, had been shot recently in that same Tullahoma camp, and now the wrathful general was swearing that he would keep his communications open if he had to kill every man along the whole line of the railroad. The sunlight seemed a glare rather than a radiance in Strathboro' that day.

Over the hill the marching men passed out of sight, leaving a faint trail of dust, like smoke, behind them. Blossier went up the street and stopped at Mrs. Pembroke's gate. She was a widow, and Jimmy, whose lame leg Blossier so sorrowfully remembered, was her only son. She sat on her front steps, her gray, disordered head in her hands. Blossier bared his, as he stood there, silent.

"Oh, they did n't take you!" was Miss Catherine's salutation when she finally saw him.

"*Non*, madame, I rest here for to protect ze ladies. I am rejoice to aid you of any manière. Zee government regard my country, *voilà je*—how you say—I is here. Command Blossier, madame."

"There ain't anything you can do," said Miss Catherine, wearily, and she got up and went into the house; she thought it hard that she must be bothered by old Blossy just then.

As evening drew on, Blossier reflected that in the long silent stretch of the night would lie the severest trial to "the ladies'" strained nerves. He put himself in their place, and conjured up what he conceived to be the fears hovering in their imaginations. His good offices had not been rejected always, during the day. He had helped one woman with her fretful sick child, he had brought wood and water for others who were deserted by their servants; but what could he do at night?

He was sitting in his cabin, gazing westward into a serene, cloudless, primrose sky; as he got up and turned indoors, his eye fell on a queer, big something in a dark bag in a dusky corner—he had an inspiration! In that bag was an old viol, a double-bass, a relic of a time, draped in the mists of antiquity, when Blossier had "assisted" in a theatrical orchestra.

Perhaps few musical instruments are less adapted to the purposes of a strolling serenade than a double-bass; but as Blossier caught sight of his, it was to a night of serenading that he dedicated it. He would systematically patrol the town, and from that double-bass should issue strains assuring the poor ladies that a friend was near and on the watch.

To be sure, as he considered the scheme, he felt keenly the limitations of a double-bass. He knew that his was not even good of its kind. He had regretted before that Fate, at the time she made music his resource, had not thrown a

more companionable instrument into his hands, but never before did he feel its galling deficiencies as now. Why, a fife would be better!

Blossier felt the picturesque and poetical element in his plan, and that it was odious to be obliged to depend on such means for its execution. However, there was no chance of getting a fife and learning to play it within an hour, so he soon contrived more optimistic views of the case as it stood. A bass-viol gave forth, at all events, a very strong masculine sound, well calculated to convey assurances of protection!

He put himself again into his ragged coat, again took up his ragged straw hat, and started forth to inform the ladies of his intentions; there would be nothing comforting in it if in the night that heavy scraping boom took them unawares. "*Au contraire*," he said gravely to himself.

It was not hard to spread the news. The women were concentrating their weakness for the night; scattered relatives were flocking together to spend it at the most central house of the clan; the women living on the outskirts of the village came over the bridge, or down the turnpike, or up the stage-road, as the case might be, to lodge for the time being with neighbors more closely neighbored than themselves. The general trepidation passed the bounds of reason. Many Strathboro' households had been exclusively feminine for many months,—yes, years,—their natural protectors had been long endangered beyond the chances of this misadventure; but with a solidarity of sentiment that did them credit, the women all agreed to suffer in kind with those who had special cause for alarm, and uncommon fear prevailed.

Blossier was a little man, a little, thin, dim, hay-colored man, but with so French a face, and of a type so associated in our minds with dark coloring, that it seemed as if he must have faded to his present tints after centuries of exposure to the weather.

The viol was much taller than was he, and, you may be sure, after he began his patrol at ten o'clock, he soon found more reasons than sentimental ones for wishing it something else.

On his first round he stopped in front of every door on one side of the street, and boomed forth a few deeply buzzing bars of the "*Marseillaise*," or still more unfamiliar and dislocated strains from "*Orphée aux Enfers*."

He had vague doubts as to the appropriateness of Offenbach, but the jolly fragments he remembered titillated his own Gallic nerves so delightfully after the emotional tension of the song of patriotism and the exhaustion of carrying the viol, that he concluded the ladies too must surely find them cheering.

Some of them confessed afterward that they were comforted by these sounds as of a gi-

gantic bumblebee in musical practice; others said they were so queer and foreign-like that they made them lonelier than before; they fairly "honed" to hear even that old fiddle grumble out an attempt at "*Dixey*," or "*Julianna Johnson Coming to Town*." The night wore on.

And oh, how slow that keen-eyed star  
Has tracked the chilly gray!  
What, watching yet! how very far  
The morning lies away!

Mrs. Pembroke, moved by a half-conscious remorse for her daylight ungraciousness, came out to her gate as Blossier stopped there for the second time, and asked him in to have "a dram and a snack."

Pretty Miss Molly Boon called to him once, as he went by her mother's house, and asked him to come in and help her move a sick child. Miss Molly gave him a cup of coffee. The east was gray with the welling dawn when Blossier, weary enough, stopped before the last house at the end of a street—his bow arm dropped, his eyes fastened themselves on a corner of the house—yes; there it was, fire! a curling spit of flame leaped, vivid in the darkness, around the corner, above the floor of the porch.

The double-bass fell. Blossier ran up the walk; before he could reach the house the sneaking flame had grown bolder, it had fastened itself into the wooden pillar by the wall. He shouted; he threw a stone at the door as he ran; around the corner the fire was bursting up from a pile of debris against the wall; it caught like teeth in the dry clapboards; the porch-pillar was burning. Blossier ran in upon the blazing stuff; he had torn off his coat and wrapped it around his fists, and he kicked and knocked the brands far out into the gravel walk and the grass. Two women were now beside him. It looked as if the house would go; the little flames were burning merrily. That meant that most of the town would go, for a fine dawn wind was springing up. They brought buckets of water and a ladder, and meanwhile Blossier was whipping the fire with a shovel that he had caught from one of them. He contrived to command the women without losing a second; he made them pour water from the floor above; he fought like a fiend. Suddenly a memory of the barricades rose clear and sharp within him as he had not remembered them for years; the spirit of war swelled like a trumpet's note within the little man, and his soul responded to its own cry for the salvation of "*les femmes et les enfants*."

It was a sight to see, the alien, old Blossy, in the weird growing light, his life in his hand, his clothes burning upon him, his face scorched and smoke-blackened, fighting, at the close quarters of a death-struggle, an enemy that was not his enemy, gaining a victory that did not save him!

The joyous light was pouring over the summer earth in delicate, elating wavelets when the last flame flickered out, and Blossier fell amid the cinders as if he too were gone.

The crying women—one white, one black—bent over him. The old negress started to lift him, but her mistress caught her arm.

"A'nt 'Cindy," she said, "take his feet," and she pushed the servant aside, and stooped herself over the ghastly face.

"Miss Jane," said the other, "I kin tote him by m'se'f. You 's too trembly—"

"I 'll help tote this man into my house myself, A'nt 'Cindy," was Jane M'Grath's answer; and together they lifted their burden.

"Into the spare room," said she in the hall. Her voice was clear and hard, while her tears, falling like quiet rain on Blossier's face, were making little white blots and streaks there.

In the beginning of the conflict, Mrs. M'Grath had set her five-year-old daughter on the gravel walk by the front gate, out of harm's way, and told her to stay there. There she still sat, crying lustily.

"Go over after Miss Mary Bell Croft," Miss Jane now commanded Aunt 'Cindy, "and take Janey with you, and leave her there; the children 'll look after her a while."

As she spoke she was cutting his clothes away from Blossier; his arms seemed badly burnt. She saw this had better be done before he came to himself.

"Do you know the news?" called Mrs. Pembroke to Mrs. Kitchens, across the way, hurrying out to the front gate, while her breakfast was being put on the table. "The town came within an ace of burning to the ground, lock, stock, and barrel, last night. Jane M'Grath's house was afire, and old Blossy—Mr. Blossy I reckon I feel like calling him to-day—put it out, and he got burnt mighty bad. Old A'nt 'Cindy came over hours ago to fetch Mary Bell to come help Jane fix him. They ain't got no idea how it caught. The children—A'nt 'Cindy's grandchildren and little Janey—had been piling up some rubbish 'gainst the wall, making a play-house, and that was where the fire begun. You never can tell what children are up to; like as not they 'd been trying to roast corn or something. There was a right smart south wind blowing early, and if Jane's house had got fairly caught—No; 'Cindy said they did n't think Blossy was burnt dangerous. Yes; you're right: he is lucky to be in Jane's hands. Jane ain't smart, but she 's mighty clever. It 's a wonder I did n't see the whole thing. I was up and down all over the house most of the night, and I heard that poor thing scraping and bombing on that there big fiddle of his, all over the town. Yes, it was kind o' company; but I lay down 'bout daybreak, and got to snoozing after 'while.

Mary and little Mary stayed mighty still. I never heard 'em up and down none after eleven o'clock, but Mary says she never slept two hours. But I tell you, a man never has the wife that 'll worry over him like his mother. I feel like I 'll walk to Tullahoma myself to-day, if I can't find out something 'bout Jimmy any other way," and Miss Catherine wiped her eyes as she turned toward the house, calling, "Yes; I'm coming," in answer to a second shrill warning that breakfast was waiting, and leaving Mrs. Kitchens still struggling to get in her account of how she spent the night.

This was about as much impression as the incident of the fire made anywhere: the town had come near burning down, but it had n't; old Blossy had saved it. There was something a little embarrassing about this: it made the usual tone about him seem, just at the time, ungracious; yet what other tone was there to take?

Anyhow, Jane M'Grath was taking care of him, and if she wanted help she knew where to ask for it, and—when were the men coming home from Tullahoma, and how were things with them?

Yes, it was well for Blossier that it was Jane M'Grath's house he had saved; it was well that it was on her, and not on another, fell most directly the debt of gratitude that the whole village owed him, but which the village was too stupid and insensible, too preoccupied and too selfish, to realize and acknowledge. Jane M'Grath was accounted in Strathboro' a particularly dull woman. Strathboro' cared a good deal for what it called smartness, and carefully classified all examples thereof as either bright or deep; but Jane M'Grath, whom they had known all her life, was, as was well known, not smart, neither bright nor deep, though she was clever—that is, good-natured, kindly, easy to get on with. Jane was more than good-natured; she was good—good with that positive quality of character that cheapens everything else in this world by comparison: and she was the furthest thing in the world from a fool; she was a wise woman.

Strathboro' did not count the conduct of life among the achievements of smartness, though it valued that too, and gave Jane a certain meed of appreciation as a wife, a mother, and a house-keeper.

Jane put her views of life's duties into no words. She did not think in words; she made about as much use of language as your horse might, for convenience, if he could.

One day as Blossier, his swathed hands on a pillow before him, sat in a big wooden rocking-chair in a wide, dim, breezy hall, sunshiny outdoors before and behind him, it occurred to him that he was getting well too fast. Janey,

according to orders, was playing on the gallery, within sound of his voice, so that he could call her "if he wanted anything,"—not that Blossier had been known to want anything since he had been in the house.

Aunt 'Cindy's voice, softened by the distance to the kitchen, rose and fell on the pleasant air in religious fervor; and up-stairs Jane M'Grath's footsteps could be heard. The men had all come back from Tullahoma a week before, but Andy M'Grath was not among them; he had been in the field a year, and two more were to elapse before he should return. Jane felt that the entire weight of their debt to Blossier devolved for the time upon her.

Janey's moon-face appeared at the door,—she felt it incumbent on her to come and look at her charge occasionally,—then, seized with a sudden impulse, she clambered down the steps, disappeared, and in a moment was laboriously climbing back again, with a very big marigold in her hand. She trotted to Blossier, her bare feet softly patting the bare floor, started to hold it out to him, remembered the swathed hands, and held it up, tiptoeing, to his nose. Flowers were to be smelled in Janey's creed, without petty distinctions as to odors.

"*Merci,*" smiled Blossier, as she laid the happy yellow thing on his pillowed lap; "*ne comprenez vous pas? Non?*"

The child stood looking in his face, grave and silent, ready to see what this odd creature would do next.

Jane had come down the stairs, and was standing looking on; at the same moment, then and there, she and Blossier each became possessed of an idea—small ones to be sure, but destined to become pregnant.

Blossier's blinking little lashless eyes (the lashes had been white, so their absence made no great difference in his appearance) were fixed on the curl-rags that tied up Janey's straight brown locks. Jane herself was a simple, plain body, not given to considering the decorative side of life, but she did sorely want curly hair for her child! Blossier's mind reverted to a hair-dresser he had once known in New Orleans—if he only had such a pair of tongs as that man used he was sure he could, when his hands got well, curl Janey's hair to a marvel; and how pleasant it would be to come and do it every day. Vague vistas of usefulness to this worshipful hostess opened up cheerily before him.

The dear dumb Jane was remembering certain Strathboro' girls who had gone to boarding-schools where they had studied French,—everybody knew they had; it was often mentioned in their honor,—but she had heard some very smart people—Judge Caldwell, for instance—say they did n't believe they could

speaking it, and Judge Caldwell mentioned that he had Northern kinfolk who got French nurses for their children, so that they learned to talk French when they were little. Why (this preface and conclusion came all but simultaneously in Jane's mind)—why could n't Janey learn it from Mr. Blossy, and why could n't other children learn from Mr. Blossy (she had a pang here at giving up the hope of a lonely eminence of learning for Janey), and thus Mr. Blossy be lifted to the dignity and prosperity of a teacher? That might indeed be a payment on the debt of gratitude.

Janey looked at her marigold with thoughts of reclaiming it—it seemed unappropriated, unappreciated, lying there on the pillow; and then she heard the coaxing voice of Aunt 'Cindy's small granddaughter calling from the big crape-myrtle tree,—she was not allowed to trespass further upon the front yard,—“Janey, Janey, I got a pooty fur ye, Janey,” and she trotted off to bestow her society where it was most prized.

Janey may not have been blessed with many ideas, but she gave profound attention to those that did visit her. She pondered all day on the possibility of Blossier becoming a teacher of French, and after supper she went over to consult Mrs. Pembroke about it.

“Of course,” she said, after she was seated on the gallery in the starlight, and had introduced her subject, “nobody can do much with the war going on, but I'm willing to make some sacrifices for Janey, and Mr. Blossy would n't expect much; we could just share what we've got with him till times are better. I'm afraid he's been awful pore lately. And, after all, the town would 'a' been 'most burned down sure if it had n't been for him, sure for a heap more as for me.”

Miss Catherine had no little children to be instructed, so Jane with difficulty and hitches got out so much suggestion of Strathboro's obligations.

“That's all true, Jane,” replied Miss Catherine, cheerfully; “but everybody ain't as anxious to recollect them kind of things as you, and as your mother was before you. I remember now how she cherished that old Mammy Dinah of yours, just for the way she nussed you when you had that terrible typhoid sickness when you was little. Seemed like she could n't do enough for that niggah when she got old and wuthless. Good niggah she was, too.”

There was a pause, and, just as Miss Catherine was again taking up the thread of reminiscence, Jane interrupted:

“Mr. Blossy ain't a niggah, and it seems kind o' dreadful to see a white man live like he does here in Strathboro'. It ain't as if he was a real poor-white either. He's got education,

I've heard tell. He reads French newspapers. He's got some now at my house."

"Well, he's a foreigner, you know, Jane. You never can tell anything about them like other people. He's been here doing niggah's work years, but it don't seem exactly like any other white man doing it. He's just a Frenchman first or last, and for them that wants to learn French, I reckon that's what they want. I s'pose it would be a good thing for the pore old body, but you can't do much, Jane, with the war going on, and the Lord only knows—" then loyalty sealed her lips against the first expression of doubt as to the conclusion and after-tale of the conflict. As to the present she was right. In those days there was small interest in Strathboro' in the acquirement of French by any means whatsoever. Jane accepted this fact, and went her own way.

Long before poor Andy M'Grath, gaunt and tattered, despairing and beaten, came back to his home, Strathboro' had become familiar with the sight of Blossier going about his work with a tiny figure by his side—a little girl with the most marvelous double rows of brown curls under her corn-shuck hat; curls as stiff and slick and regular as if they had been done out of wood with a turning-lathe. Strathboro' admired the curls unanimously, but an accomplishment of their owner filled them with an even livelier interest. That little thing could speak French—talk it right along with old Blossy!

The pair were continually called upon to demonstrate the fact.

When old Mrs. Farnley came in from the country to stay with her daughter-in-law, she was not to be convinced by the ordinary exhibition.

"You, Mr. Blossy," said she—"you go clean out there by that there crape-myrtle, and stay there where I can see you. Janey, you tell Mr. Blossy when he comes back to give me my stick—tell him in French." Janey was a little mystified, but she was used to exhibiting her French, so she successfully performed the feat required of her; and when Blossier, with a bow, handed the old lady her staff, more witnesses than one had a new realization that the strange tongue was not a meaningless jargon.

Andy M'Grath's soul was as much like Jane's as one corn-field pea is like another. The Infinite mind doubtless saw distinctions between them, and Jane knew that Andy took more sugar in his coffee than she did, and Andy knew that she would spank Janey sometimes when he would not; but so far as other human beings were concerned, they might as well have had interchangeable identities. When they got married, Mrs. Pembroke remarked to Mrs. Kitchens that it was curious to see two such good, dumb, clever, say-nothing bodies marry

each other; but then, she added, perhaps it would have been more curious yet if they had not.

Of course Andy accepted Blossier in exactly Jane's spirit. He felt a little at a loss as to how to conduct himself with a Frenchman, finding himself without social traditions on that point; but he had the best will in the world to adapt himself as well as he could to any new etiquette required. Neither he nor Jane had a touch of the usual sore contempt for ways new to them—so little may a large spirit be dependent on experience or intellectuality.

Andy had been home a week, and it was the evening after they had first persuaded Blossier to sup with them. Janey, her curls tumbled into merely human tresses, but presumably dreaming French dreams, lay in her trundle-bed; and close by, Jane and Andy sat at the window, cooling off, and, as they said, "talking things over." Jane now opened up the subject she had had so long at heart.

"Pears, Andy, like Mr. Blossy's too good to be doing niggah's work all the time. Of course with a Frenchman things is different, but seems like if he can teach Janey he might teach others."

"It pears like it would be more fitting," said Andy, seizing the idea.

"It's called a smart thing to know French; there's Babe Tucker."

"Blossy must know all about it," responded Andy again.

"Yes; I heard Judge Caldwell say years ago that he was educated."

"It's a bad time now, Jane."

"I know that, Andy, but we can just try and get him started. The war's over, and people got to educate their children quick if they're going to 't all."

"French is extr'y."

"Well, Blossy's right here, and a heap of houses besides ourn would have burnt down if he had n't been. It won't cost much. He'll be better off, anyhow, than working all the time like a niggah. You talk to your brother Ben, Andy; he'll like to have his girls as smart as Janey," concluded the self-sacrificing Jane, with a sigh.

TEN years from that night Judge Caldwell was saying to a guest, a lawyer from western Tennessee: "Yes, sir; Strathboro' can show more people, old and young, accomplished in the French tongue, sir, than any town—a larger proportion, sir, so accomplished—than any town in the State. There are numerous children in Strathboro' that talk French with each other together at their play, sir, sometimes. In fact, there is a little niggah here about the house somewhere now that I heard saying—"

you, 'Liza, where 's that piccaninny of yours?' the Judge interrupted himself to call to a servant passing the door.

"She done sleep, Jedge."

"Very well; never mind.

"Well, sir, I must let you hear that little darky talk French in the morning. It sounds comic, it does indeed. She picked it up from my grandchildren. Strathboro' always had a literary taste. This county has produced a large proportion of the great men of middle Tennessee, Mr. Hunter,—a large proportion even take the whole State together, sir,—and owing to the circumstances I have related to you, a rivalry in the French language and literature sprang up among our people,—ladies and children, that is, chiefly,—till now, sir, almost as many of them have read 'Corinne,' sir, Madame de Staël's masterpiece, as are familiar with the 'Beulah' or 'St. Elmo' of our own Miss Evans."

The Judge spoke truly. It had come about that learning French was the game the town most affected; and Blossier was, of course, the teacher.

The tone about him had not greatly changed; a familiarity with French had not much decreased Strathboro's sense of the anomalous in the existence of a Frenchman; but the face of life had greatly altered to Blossier. Stimulated by the gentle proddings of Jane M'Grath, he had studied to fit himself for his new calling, and it had come about that he had developed a little genuine simple interest in exercising his few wits, and (bless him!) was enjoying his sweets of the intellectual life.

Moreover, though the tone of the town about him had not much altered, nevertheless its tone to him was necessarily, in the new circumstances, more friendly and considerate, and that deeply touched and pleased the little man.

He still lived by himself, but now it was in the "office," in Mrs. Pembroke's yard, and so he was within the pale of civilization, and could be looked after if he fell sick. Jane had not rested till that possibility was provided for. But Fate is apt to pass over the possibilities scrupulously provided for; Blossier had never spent a day in bed since he recovered from his burns, when one autumn the dear Jane herself sickened and died, and was laid away in that shadow village always growing, growing, silently and ominously, by Strathboro's side.

Poor Andy M'Grath was indeed left, as Aunt 'Cindy said, like the half of a pair of scissors. Yes, that was it; he was now a something absurdly useless, unnaturally unfit for existence, a something to provoke the mirth of Olympus.

How strange a thing, still strange in its awful familiarity, that a creature so inoffensive, living in dumb, helpless good faith the life thrust upon him, could seem so played upon!

At the funeral, after Jane was laid in the ground and the earth was well heaped over her, Andy turned his poor bewildered, pain-dazed eyes upon the faces about him, and amid their wearied assumption of solemnity, beneath which the usual easy little interest in the commonplace was already asserting itself, he saw Blossier, his features working convulsively, as he gazed with eyes that did not see upon the hideous mound.

It was not in Andy to feel resentment against the others; perhaps he too realized, in the depths of his wordless consciousness, that poor humanity could hardly exist except as it is "well wadded with stupidity"; but his heart went out to Blossier, and was eased a little at the sight of his grief.

He went to him and took his hand, and without a word the two men, the two piteous old children, went away together from Jane's grave.

Months went by, and Strathboro' became used to seeing them together, and had almost ceased to gossip about the queer taste Andy showed, when one June day new fuel fed the flame of popular criticism.

The week before, Blossier had overheard one of his pupils, a middle-aged, unmarried lady, say, in his class, to her nearest neighbor, that "it was a plum' shame the way poor Mrs. M'Grath's little girls was runnin' wild with nobody but Aunt 'Cindy to look after 'em, and she so old she did n't know what she was doin', anyhow," and that it was her "'pinion that pore Miss Jane would rather they had a step-ma than to have 'em left with no raisin' at all like that."

Jane had left four daughters. This little incident gave Blossier food for profound reflection. He reflected to some purpose. That night instead of going and sitting on the gallery steps, after supper, with Andy, as usual, he stopped outside the front gate, and called with a portentous, mysterious air, "Mees-tere Andee, Mees-tere Andee,—*non, non!*" in answer to the invitation to enter, and then he beckoned, still mysteriously, with sidelong, backward nods of the head, for Andy to come to him. "Howdy?" said he when Andy reached the gate, now assuming a light, *dégagé* air, totally inconsistent with his previous manner. "Come *chez-moi*, these eve-ning."

When Andy was seated on the steps of the "office," Blossier brought him a mint-julep, and with a glass of cheap claret for himself—the one luxury of his prosperity—sat down in the doorway.

"Mighty nice," said Andy, politely; "get your mint close by?"

But Blossier was so absorbed in trying to arrange his thoughts for presentation that he forgot to answer.

"Mees-tere Andee," he at last began, "your

leetle daughtere air-r much upon my meditation. I weis zey have ze bess condition possible."

Andy stopped with the uplifted glass half-way to his mouth, and began with a troubled countenance scrupulously to study its contents.

"My faterre was one *tailleur*, Mees-tere Andee," Blossier inexplicably proceeded, putting his glass down on the step, and talking eagerly with outstretched palms, "and my moo-tere was — was — she make toy, mose delicate wiz *fin-gere*, *et moi*, me — I help, I help bote when I leetle, when I biggere."

Andy had forgotten his glass now, and was staring and yet trying to look polite and not too conscious of the strangeness of French ways.

"And, Mees-tere Andee, my *fin-gere* also, always, even now — I sew for my clo'es my-se'f always, you not know? I know I do ainy t'ing zat way easee, beautiful; and ze *manière*, ze politeness, ah, Mees-tere Andee, you know ze French peepul zey have ze *manière*; I teach ze leetle daughtere all, I keep ze houze, I sew ze clo'es, so not in Strathboro' is such clo'es, Mees-tere Andee, *si vous* — peremeet me, Mees-tere Andee, come *chez vous*, to your houze — you comprehend?"

By this time Blossier was standing on the walk in front of Andy, rapidly pantomiming his ideas, and pleading with gesture as well as with voice, as if begging that children of his own should be cared and labored for by Andy. For a moment Andy stared on in silence, and Blossier's heart was in his mouth; then he got up, caught and wrung the Frenchman's hand an instant, dropped it, and, turning his back, pulled his old soft hat over his face.

Two days later Strathboro' had the enormous excitement of seeing Blossier's household gods — a queer little cart-load they made — moved to Andy M'Grath's house, and behind the cart walked Blossier, carrying our old friend the double-bass.

So was established the oddest household south of Mason and Dixon's line.

It was a year before Strathboro' sounded the full depths of its oddity, and ceased to vibrate with the excitement of fresh discovery. Blossier took completely a woman's place in the household economy, and the world has seen

few more touchingly funny sights than that little man sitting cross-legged on the floor of Jane's old sitting-room, making feminine fripperies of an unmistakably Parisian character, frivolous and modish, airy and coquettish, to be worn by his favorite, the faithful but stolid Janey.

He sits there yet, bald, a little shaky, annoyingly dim of sight, but still enjoying turning out, for Janey's babies now, such dainty confections of laces and ribbons as no other fingers in Strathboro' have ever concocted. Strathboro' has long ago accepted Andy M'Grath's establishment — for Andy still heads it — as one of its peculiar possessions, and takes much pride in it; and Jimmy Pendleton, who buys goods in Memphis, or one of Judge Caldwell's granddaughters, who is a belle and visits the best people from Louisville to New Orleans, or any of the most traveled residents of the place, will tell you again and again that the fame of its French and its Frenchman has gone abroad as far as west Tennessee and southern Kentucky and even northern Alabama.

Janey only, of the children, — with her husband and her children, — lives in the old place; the rest are married and scattered, and Andy and Blossier seem to depend on each other more and more as the years go by. They never had anything to say to each other, and they have nothing now, but they love to sit side by side on the gallery on summer evenings, or by the open fire in winter, as might two rough-coated, long-acquainted old dogs, and with no more sense of failure of companionship in the silence. Each understands how past and present are mingled in the other's mind, as Janey's children tumble about, nightgowned for their final romp; and each knows the dear figure that as wife or patron saint is ever in the other's thoughts, though Jane M'Grath has been buried so long that even in this small world she is become to others little more than a name on a tombstone; and together these two look forward quite trustfully to the time when their names also shall be on tombstones. And, truly, if there is assurance for the merciful and the meek and the pure in heart, for the salt of the earth in short, as to that veiled and awful door through which poor humanity is always crowding, they may be assured.

*Viola Roseboro'.*

## ITALIAN OLD MASTERS.

CORREGGIO.—1494—1534.

(ANTONIO ALLEGRI.)

HE father of the painter known, from the insignificant little town between Modena and Mantua in which he was born, as Correggio, was a clothier, but the uncle of the artist, Lorenzo Allegri, was a painter of the local

school of art, of which the head was Antonio Bartolozzi. It is probable that Antonio Allegri was a pupil in the school. All that we know is that he was set to work in an artist's studio at an early age, and next appears as a master, painting the churches of his native town in a style which for individuality and power of a certain kind must remain a problem. The chroniclers have not failed to suggest solutions in attributing his education to certain masters; but evidence is lacking for any authoritative statement of that kind, nor does Correggio's matured style grow naturally out of that of any of his contemporaries or predecessors of whom we know, unless it may show a slight early tinge of the school of Ferrara. There is no proof that he went to Rome or came under the influence of Raphael or Michelangelo, or that he studied under Da Vinci. It is useless to spend conjectures on origins or supposed influences which are not recorded in the work of the painter. Our first positive information of him is that when twenty years of age, and therefore not legally capable of making a contract, he and his father were called to the convent of the Minor Brethren of S. Francesco in Correggio, to make arrangements for the execution of an altarpiece, the price for which was fixed at one hundred ducats. This was in August of 1514; and in the following April the picture was delivered, having been executed, as is shown by a memorandum of the delivery of the panel for the work, since the previous November. The picture represents the Madonna and Child with St. Francis and three other saints, and is now in the Dresden Gallery. It is signed "Antonius de Alegris P." In the town of Correggio there remains an altarpiece in the church of Sta. Maria della Misericordia, representing Saints Leonard, Martha, Mary Magdalen, and Peter. Of what may

be recognized as the painter's early work, preceding these altarpieces, but already of well-formed manner, may be accepted a panel lately discovered in London, "Christ taking Leave of Mary before the Passion," a Madonna and Child at Hampton Court, and some minor works at Milan.

In 1518, when twenty-four years old, Correggio came to Parma, his fame preceding him, and he received at once important commissions. Donna Giovanna, abbess of the Convent of St. Paul, commissioned him to paint the ceiling of the great chamber in a fine suite of rooms occupied by her. The fresco represents a vine-covered trellis in which are sixteen oval apertures through which the blue sky appears, and in every opening there is a group of little genii playing with hunting-trophies. Sixteen lunettes underneath contain mythological scenes in chiaroscuro of gray. Over the mantel is Diana mounting her chariot. Classical convention is disregarded in the mythology, and perspective in the architectural design; in these particulars, as in his method of painting, Correggio refuses to be other than his own master. It is not known when this decoration was finished, but in 1519 the painter was at home again, called there by a lawsuit, which he finally gained in 1528, and which concerned a legacy left him by a maternal uncle. During the year 1519, however, he was a not infrequent visitor to a fair daughter of Parma, the orphan child of an esquire of the Duke of Mantua; and she became his wife at the end of the year. In 1521 he had a son born, and soon after moved to Parma, where he resided until 1530, when, having lost his wife, he returned to his native town. Here he possessed two houses and some land, and was in favor with the ruling family, as appears from his being a witness for the marriage-contract of the daughter of the lord, Gian Battista.

In 1521 Correggio signed an agreement for the decoration of the cupola and the apse of S. Giovanni of the Benedictines of Parma, for which work he was paid 272 gold ducats in 1524, 30 having been paid in advance. The paintings in the apse seem to have been removed in 1587, and are now in the museum of Parma, except two fragments in London; those of the cupola are still in place. While

MADONNA AND CHILD IN GLORY, BY CORREGGIO.

IN THE UFFIZI GALLERY, FLORENCE.

at work on the painting of S. Giovanni, in the autumn of 1522, negotiations were entered into with the painter by the chapter of the Duomo of Parma for painting the choir, with its chapel, and the dome, in fresco. He was to receive 1000 ducats for the whole; and as the payment was made by instalments between the years 1526 and 1530, it is probable that the work was completed in that period, though the choir seems to have been thrown out of the contract. In the design of the dome the base of the vault is surrounded by a balustrade, on which sit little angels, and which represents the tomb of the Virgin; the dome represents the sky, with clouds through which the Madonna is carried up to the waiting company of saints surrounded by angels, the whole suffused in a golden light. The good people of Parma, whether clerics or laymen, were not pleased with the work; but one of the chroniclers reports that Titian saw the dome, and was much pleased with it, which may be true, as Titian is recorded as having been in Parma in 1530.

Of the easel-pictures of this period, the "Betrothal of St. Catherine," now in the Louvre, was painted about 1519. There is a small replica of it in Modena in a private collection. The "Madonna del Coniglio" at Naples is of this period, as are the "Madonna and Child with St. John" in the Prado at Madrid, together with a "Noli me Tangere"; also several pictures at Parma, in the gallery, and a "St. Sebastian," painted in 1515 for a guild of archers of Modena. The "Madonna Kneeling by the Child" of the Uffizi is probably of this time, as well as the "Christ at Gethsemane" of the National Gallery in London. The "Holy Night," now at Dresden, was commissioned in 1522 and put in its place in the church of S. Prospero in Reggio di Emilia in 1530, the price for it being recorded as 208 lire. It has been sought to identify the well-known "Magdalen Reading," at Dresden, with the painting described by Vittoria Gamba in a letter to Beatrice d'Este in 1528; but it does not correspond with the description, which is of a Magdalen kneeling in a cave, with hands raised in prayer, and has now been conclusively determined not to be by Correggio. Of the mythological subjects painted by the artist, the best preserved is the "Antiope" in the Louvre. The "Mercury Instructing Cupid," in the National Gallery in London, is one of the most important subjects of this class that we have, and the "Danaë" in the Borghese Gallery at Rome is the most masterly of Correggio's nude subjects. The "Ganymede" and the "Io" are at Vienna, and the "Leda" is at Berlin.

Correggio spent his last years in retirement

in his native town, nor does there seem to be any foundation for the ingenious stories of his dying from the over-exertion of carrying home a sack of copper coin with which certain monks were said to have paid him for his work. He left a son, Pomponio, who was also a painter, and one of his three daughters survived him, as did his parents. He died March 5, 1534, when scarcely forty years old.

No one of the great painters of the Renaissance has provoked greater extremes of appreciation than Correggio. A great painter he certainly was, with certain powers developed to the highest degree attained by Italian art, but with a seductive technical mastery which has been a false light to all students who have come after him. In his catalogue of the National Gallery, Sir F. W. Burton has given a most admirable summary of the qualities of Correggio's art, to which I am disposed to make only one dissent,—from the attribution to him of any power over the imagination,—when he says: "None before him had shown the capacity of painting to affect the imagination (irrespective of subject) by the broad massing of light and shadow, by subordinating color to breadth of effect and aerial perspective, and by suggesting the sublimity of space and light." In that intellectual side of art in which the imagination resides, Correggio seems to me singularly torpid and devoid of any gift akin to the inspiration which quickens imagination, if indeed it is not identical with it. The sensuous, the splendor of surface, the magic of execution, the mastery of color-harmonies and of composition of light and shade,—the great technical, but purely technical, qualities of painting,—are all that I can admit to Correggio; and the proof that he had little besides these lies in the fact that a translation of his work into any medium in which his technic is lost becomes almost too commonplace for study. Burton says of him:

The proportions of his figures are frequently faulty. The grace which fascinates us tends to degenerate into affectation, and movement into tumult. . . . In the management of the brush he has been excelled by few and surpassed by none, and his mode of execution and his coloring are as peculiar to him as his other qualities. His flesh-tones are rich and warm, or cool and opalescent, with infinitely subtle modulations and transitions. The harmonies he sought differ from those of the great Venetians. Full colors he used with powerful effect in his oil-pictures, but he was fond of quiet tertiaries. His general abstention from green, which plays so conspicuous a part in the Venetian system of color, is remarkable.

But he concludes with a sentiment which is echoed by most earnest critics:

Taking this great genius by himself, it is difficult to overestimate his powers. But the influence he exercised upon later art was more baneful than otherwise.

The quality of Correggio which to a painter is more than any other the sign of his immense power is in his touch, the richness and decision of his impasto, and the marvelous sweep of his brush. It is this evidence of power, the fascination of this supreme knowledge of his subject and facile success in rendering it, which give the spectator the impression of a greater force beyond, which did not exist. His conceptions are merely pictorial, but, as compared with anything before him, peculiarly pictorial; there was neither religious exaltation nor recognition of any religious ideal; there was

neither imagination in his conception nor depth in his sentiment; he ran the old and the new mythology through the same fusion into the same molds. While his splendid workmanship redeems many deficiencies, his successes and their cheapness, when measured by the larger scale of values, made him one of the greatest dangers to those who, coming after him, caught his vein of feeling and learned to content themselves with what lies on the surface. His influence can have been only "baneful" and never "otherwise"; for the example of shaking off conventional limitations in treatment of religious subjects had been given before, and in wiser measure. In Correggio independence in conception of religious themes becomes profanity. His was the end of religious painting.

*W. J. Stillman.*

NOTES BY TIMOTHY COLE.

THE "Madonna and Child in Glory," by Correggio, is an early work of that master. It hangs in the Uffizi Gallery, in the Sala della Scuola Italiani, next to the Tribuna. It is of small dimensions, not measuring more than  $6\frac{1}{4}$  inches by  $9\frac{3}{4}$  inches, so that my reproduction of it is but little smaller than the original. It is a brilliant and charming little gem, naïve and sweet in conception. The colors are rich and glowing. The background is of a bright, soft yellow, with delicate rays shooting through it from the brighter nimbus about the Madonna's head; the clouds about are of soft, warm gray tones, and the cherubs' heads melting into them are of warm flesh-tints. The angel with the lyre and the woeful expression to the right of the Madonna is clad in a yellow robe, soft and rich. Her hair is yellow, and the dark wing which is seen at the back is of a rich, deep crimson. The lyre is yellow like gold, and the flesh pearly and bright. Why has the artist given this angel so sad a countenance? It is perhaps a prophetic note of the suffering and sacrifice to come, though all is joy and glory now. The drapery of the Madonna is, for the most part, blue. The under por-

tions, covering her breast and her sleeve, are of a soft, dull red. The blue robe that falls over her head and shoulders has a lining of green. It is turned up over the forehead, and falls over the shoulder. The drapery of the knees is of a fine, rich tone of blue. The flesh-tints of the Madonna and Child are in cool, pearly, bright colors. The angel playing on the viola is clad in a grayish blue robe, purplish in the shadows. The hair of this angel is of a soft brown, and the viola is of a soft yellow color. The clouds in the foreground are of cool, bright tints. I have endeavored to give some of the force and brilliancy of the original by an admixture of fine and coarse cutting, for a coarse line gives a sparkle to the tint, while by a fine line we can get a dull, soft gray. Thus the foreground clouds owe much of their brilliancy to the contrast of the soft, fine gray cutting of the background, and the brightness of the flesh-tints is enhanced by their juxtaposition to finer work.

This work of Correggio is under the name of Titian, but the authorities are unanimous in ascribing it to Correggio.

## KENSAL GREEN.

(OCTOBER 23, 1890.)

WITH what sorrow, with what sadness,  
Laid we one whose heart was gladness  
Underneath the gentle sod.  
Silver mist and birches true  
Wept for him their tears of dew,  
Wept for him their tears of dew.

Slowly, sadly we departed;  
One was dead, one broken-hearted,  
In this graveyard old.  
Silver mist and birches true  
Wept for both their tears of dew,  
Wept for both their tears of dew.

## VI. THE HOMEWARD VOYAGE.

COLUMBUS determined to leave some thirty-nine men in Fort Nativity, in order that he might the better sail homeward with the rest. His friend Arana, a kinsman of Beatrice, was left in command of the im-

proved fort and its slender garrison. A royal chamberlain was appointed to succeed the commander in case of need, and a Segovian to replace the chamberlain. A surgeon, a carpenter, a ship-calker, an armorer, a tailor, and a gunner were also left to ply their callings if required. Columbus had brought with him so abundant a stock of provisions that he was able to leave wine, biscuits, and supplies for a whole year. To these he added arms for their defense, and seeds wherewith to cultivate the fruitful soil. Having thus furnished all the necessary stores, he supplied them also with wise counsel. First of all he enjoined submission to their commander, since without a head all would be vain, while obedience would foster good will and concord among them. He said that, if obedient and in close fellowship with one another, they would obtain the mastery over the Indian tribes and country, not by an unnecessary show of force, but by the natural ascendancy of their virtues and intelligence. Cordiality in their relations with the natives, respect for the latter's customs, with purity of life, would justify the Indian's good estimate of the Spanish character, while submission to temporary exile would find its reward in benefits to come, and in the glory of being the first to rule the new-found land. All this seemed plain sailing to Columbus because of the skill these men had shown in overcoming the difficulties of the well-nigh fabulous enterprise. The cacique deeply regretted the parting from his friend, as did the little band of Spaniards from their far-sighted leader. Tearful were the leave-takings, although the admiral fired joyful salutes to banish forebodings and instil new hopes.

On January 4, 1493, Columbus set sail, and on the 5th he hove to before a great rock that towered like a mighty cathedral, to which he gave the name of Monte Cristo. January 6, he met Martin Alonso Pinzon. The Indians had already reported having seen his bark in

the bays of Haïti; and although scarce believing the good news, Columbus had written him friendly letters as though nothing amiss had happened, being naturally apprehensive of a rupture which might turn to open animosity and defeat all his plans, especially as he himself was at the mercy of the commander of the *Niña*, the brother of his rival. These letters had never reached Martin Alonso's hands. So, when they met Columbus made no reproaches and accepted as sufficient the puerile excuse that stress of winds and waves had divided them, when he well knew that Pinzon had yielded to the tempting tales of abundant gold in those regions. The latter had indeed found much gold, two thirds of which he had divided among his sailors, keeping the rest for himself. Imbued with the conviction that he had been predestined from his cradle to this supernatural mission, Columbus attributed the conduct of his lieutenant to the wily scheming of Satan for his destruction. But, being a good mystic and a Franciscan of the third degree, he deemed it expedient for his ends to balk the infernal plot by the most exemplary patience, and so remained silent, being assured of the untruth of Pinzon's story, and resolved to punish him for it when he should get him safely back to Spain. This meeting with Martin Alonso hastened the return, Columbus being apprehensive lest some offered chance might add a graver wrong to Pinzon's desertion. The daily marvels of the voyage allured him in vain, siren-like fishes, turtles as big as bucklers, rivers with sands of gold, Eden-fields, sculptured promontories, placid harbors, and beauteous islands, hardy natives, abundant signs of gold like a ceaseless mirage entralling his will with promises of wealth. In vain were stupendous tales told him of two islands hard by in those waters, one inhabited only by men, and the other by women, who visited but once in each year; in vain the conflict of five sailors, who went ashore at Monte Cristo, with the warlike natives, whose attempt to capture them led to the first shedding of Indian blood — Columbus was in haste to return to Spain without further delay, and on the 17th of January, 1493, the shores of his new-found world sank from his sight.

Good weather and a fresh breeze favored

this homeward course until the 11th of February. On that day they fancied themselves near some land, for many birds were seen. They knew not for certain where they were. Some said they must be off the Azores; others Madeira; others that they were nearing the mouth of the Tagus and the lovely rock of Cintra. But, unfortunately, they were on the edge of a fearful storm, that burst upon them on the next day, February 12. It was in truth a new and strange experience for them. Afloat since their departure from Palos, the discoverers of the New World had suffered no other mishap than the loss of their flag-ship on the Haitian reefs owing to heedlessness and slumber, through over-confidence, on a glassy sea and in a gentle breeze; and even that had found compensation in the noble friendship of Guacanagari, and in the opportunity to explore the richest gold-country they had yet seen. From the dawning of August 3, 1492, until daybreak of February 12, 1493, it seemed as though every beneficent influence had sped them on their way. The steadiness of the winds, which seemed to blow ever from the same quarter, was fancied by the explorers to be an obstacle to their return to Spain. How often had the admiral likened the face of ocean to the bosom of Guadalquivir, its fragrance to orange-blossoms, and its skies to those of Andalusia, lacking only the nightingale's song to complete the voluptuous joys of Seville. If, on their homeward course, spurred by the eager wish to tell the tale of their discoveries, they were thus smitten by a dreadful tempest, it could only be, according to Columbus, because of the continued machinations of Satan himself, warring against the discovery of these new lands and the conversion of their inhabitants to Christianity. The storm was the more appalling, inasmuch as the caravels were leaky and unballasted. Science then knew nothing of the world revealed by the microscope, and so those sailors could not know that tropical animalculæ were burrowing the timbers of their barks and weakening them day by day. Worm-eaten and lacking ballast, the caravels sped like arrows amid the blasts and the seething billows. All poets vie in depicting the fury of the ocean tempest. Columbus very soberly describes the terrible tempests he himself had passed through, unlike Vergil, who pictured, with poetic heightenments, the storms he had never experienced. The historian of to-day, lacking personal knowledge of such a tempest as broke upon Columbus, may yet appreciate it by conning the pages of his journal. After much lightning and high winds on the three preceding nights, the gale increased on the night of the 14th. Suddenly there lowered upon those frail caravels a thick ashen and leaden

cloud; the waves raged beneath the hulls, meeting in awful shock, as though driven by contrary currents; upon the sails and rigging fell a deluge, as though the waters of the ocean were above them as beneath; beetling mountains seemed to rise from the eternal darkness that yawned below like the shades of hell, and jagged lightning-peaks glared above them as the storm-clouds changed their form; while whirlwinds as conflicting as the currents of the sea threatened to swallow them up. In vain they took in all canvas and lay under bare poles; death faced the terrified sailors. It being impossible for the *Pinta* to withstand the hurricane, she was soon driving before it. Lights were shown from the *Niña* all night, but at daybreak the *Pinta* was not in sight.

Columbus gave himself up for lost. His discovery seemed about to sink forever in the silent depths, leaving naught but the superstitions of old to bar the ocean-wastes from all such mad ventures as his, upon which heaven's wrath was thus visited. His sons, to whom he was bearing the hereditary rank of admiral and a domain such as mortal had never won, wrested by a miracle of genius from kings and pontiffs by the son of a humble wool-carder, were to be left orphaned and in want. The benevolent monarchs and the mighty magnates who had been his patrons would never welcome him, as in dreams he had so often pictured, with open arms and hail him as a conqueror. The acclaim of proud cities, the gratitude of kings, the gifts of fortune, unparalleled riches, power, and name for him and his, were all to be swallowed up in the abyss. Memories, too, came thronging of the dear companion whose love had enthralled him in Cordova, and brought him joy and forgetfulness amid the horrors of his darkest trials. Possessing all a sailor's faith, Columbus implicitly trusted in the efficacy of vows, as suited also his intimate beliefs and cast of mind. To appease the divine wrath he offered a humble public penance and a pilgrimage—in his shirt, and upon his knees—from his ships to the sanctuary nearest the spot where he might land. The crew all asked to be admitted to share in the act of penance, even as they were sharers of the awful chastisement. Beans were shaken in a cap, one for each man on board, one of them being marked with a deep-cut cross, so that he who drew it should make a penitential pilgrimage to Guadalupe. Columbus drew the cross-marked bean. Lots were cast for a pilgrim to go to Loretto, and it fell to Pedro Villa, a sailor of Puerto Santa María. They next drew for one to go to Santa Clara of Moguer, and the lot again fell upon Columbus, who, being thus burdened by the caprice of chance with two penances, felt greatly con-

soled, deeming his choice a special grace of heaven. This duty to his Maker being performed, Columbus turned his attention to men; and, in order that the memory of the discovery might not perish, he wrote it down amid the storm, and, wrapping his scroll in a waxed cloth, sealed it up in a keg, which he cast overboard, trusting that, by God's grace, his precious secret might float to shore, and somewhere fall into good hands.

On the 15th of February they sighted land, but what coast they knew not. However, seeing land and landing were, under the circumstances, by no means the same thing. The sea still ran very high, and, as *Las Casas* says, the ships could only tack with the utmost difficulty. On closer examination they supposed themselves to be near one of the Azores. Columbus by this time was worn to a shadow by fasting, loss of sleep, and exposure, sustaining life by the sheer force of fevered excitement, although well nigh exhausted by the wet and cold. From the 15th to the 18th they stood off and on without being able to run inshore; but on this latter day they landed, and found that the island was called *Santa María*. Columbus naturally looked for a hearty welcome from its people. Saved as by a miracle from the dashing billows, the land he saw seemed to him almost supernatural. His newly discovered islands, opening fresh fields for the islanders of that region, assured him of triumph, and not repulse. Indeed, the first demonstrations were friendly and joyful, and the islanders showed the greatest delight on hearing of the discovery and beholding the discoverer. But beneath their show of glad welcome lurked a base treachery. Notwithstanding Castile had made peace with Portugal, the Portuguese king could not resign himself to the thought that so great an enterprise had slipped from his grasp. As, on the setting out of the expedition, it had been reported that he was resolved to prevent the exploration, so now, on its return, the fruits of the resentment born of his own want of insight and judgment became apparent. But in all that the Lusitanian monarch did in this regard is noticeable a spirit of indecision that explains his failures, for great resolves demand not only firmness of will, but fixity of purpose and clearness of plan. Dom John could not rightfully ascribe to Columbus the burden of his own error; mute indeed was the conscience of such a man not to confess the true responsibility for the irreparable blunder, which in the sight of history rests only on the king himself. Columbus sent three men ashore, and they did not return, being detained by the eagerness of the islanders to hear their marvelous story; but two messengers from the captain of the island came to the caravel, bringing fowls and other fresh sup-

plies for the crew. The admiral showed them great courtesy and told them how, in fulfilment of a vow, half his crew would go the next morning in solemn penance to the nearest hermitage. They so went, but, to their keen surprise, were assailed by the Portuguese, who, gathered on foot and on horseback, invaded the sanctuary during the mass, with threatening gestures and ribald cries, and seized as enemies their allies and guests. An equal surprise was in store for Columbus. While awaiting the return of the pilgrims in order that he might himself perform the like duty, the Portuguese captain put out in a boat, and told how he had imprisoned them all. Indignant at this incredible outrage, and after announcing his titles of admiral and viceroy, and exhibiting the letters patent of his sovereigns calling upon all friends and allies to lend customary aid to him, Columbus wound up by threatening the offenders with the wrath of Castile, mighty to avenge wounded honor, until not one stone should be left upon another. Fearing lest his moorings should be cut by the rocky bottom, Columbus determined to quit the spot. He had no ballast, however, having been obliged to make use instead of casks filled with sea water; nor even sailors enough, for all his ablest seamen were prisoners on shore. The thick horizon and swollen sea, and the reduction of his able-bodied crew to three skilled sailors, were enough to dismay Columbus, and to make him turn with longing eyes to the fair islands he had quitted, as to an earthly paradise. The sea rolled furiously inshore, and so tossed the ships as to add bodily discomfort to mental anguish. Yet he gave thanks to God even now, for had he been forced to encounter heavy cross-seas instead of broadside rollers, he would inevitably have foundered. The admiral went in search of better shelter at an island called *San Miguel*, but could not find it. He dreaded to return to *Santa María*, yet, despite the injuries there suffered, he put back, whereupon several men called to him from the craggy shore, and begged to be taken on board. Soon a skiff put out, manned by five sailors, two priests, and a notary, who asked to see the royal letters and commissions of which he had spoken. Columbus refused, distrusting their intentions; but not having evil means at command, he resorted to good, and, exhibiting the letters, demanded the restoration of the prisoners, which was at length accomplished, to the great satisfaction of all concerned and to his own keen relief. Once a prisoner of the Portuguese king, as Columbus averred he would have been, when could he have regained freedom? Unbounded, indeed, must have been his gratitude to God for having thus happily escaped this fresh affliction.

Taking his men aboard, he turned prow to-

ward Castile on Sunday, the 24th of February. He encountered variable weather until the first days of March, when a violent tornado again struck him, and brought him within two fingers' breadth of loss and ruin. He vowed more pilgrimages to various shrines of the Virgin, while to his God he offered the sacrifice of patient submission to the divine decrees. The mountainous waves, whose fury no poetic trope can depict, overtook and dashed madly upon the frail bark, tossing it aloft as though to crush it, and again hurling it down into the depths. He sighted land amid the thick pall of inky clouds lit by the lightning-bolts, and gave orders to shorten sail, since it was exceedingly dangerous to be offshore in such a storm and darkness. The gale soon blew itself out, and on one hand appeared the white dunes that hem the harbor-mouth of Lisbon, in front lay the broad emboguemment of the Tagus girt with golden sands and white with the lacerity of the surges, while near by was the picturesque port of Cascaes, an intermingling of cabins and skiffs, of fishing-nets and plows; and, greater than all, the lovely Rock of Cintra, damascened with gardens, bright with flowers, and fragrant with balsamic odors. Columbus would much rather have hit upon lands where floated the banner of Castile, for he was inspired with slender confidence in a state whose authorities had so rudely treated him in its outlying possessions, and whose king had sworn to charge upon others acts for which a right conscience could himself hold alone accountable. But he could not avoid anchoring in the Tagus. The crested waves still pursued him, and storms violent beyond the experience of man prevailed, so that in those days some five and twenty ships of Flanders with many trusty seamen were swallowed up. On entering the mouth of the river, fearing an attack by the people of the shore, Columbus asked permission to moor in front of Lisbon itself. There he found at anchor a powerful royal ship, of heavy tonnage and armament, under command of that skilful master Bartolomé Diaz, who came in his long-boat to the caravel, and bade him follow whither he would take him. Columbus resisted this command, as befitted his exalted rank and powers, merely exhibiting the letters patent in virtue whereof he might enter at will the ports of any state in alliance or amity with Castile. His high office being made known, every courtesy was shown him. The captain of the Lusitanian ship visited him, attended by musicians and in great pomp, paying him much attention and sharing in his rejoicing; the folk of Lisbon crowded to see and to acclaim him for having dispelled so vast a mystery by his daring, and for revealing to the world so strange a land by bringing back with him liv-

ing examples of its primitive race. Dom Martin de Noronha, a Portuguese hidalgo, brought him a letter from Dom John II., inviting him to the court, where he was notably welcomed; the villagers of Sacamben, where he passed a night on his way to the king's seat, greeted him with all sorts of festivities; the prior of Crato, the foremost personage of the neighborhood, entertained him as a guest in obedience to Dom John's orders; the king seated him at his own table with the greatest respect, and listened attentively to the narrative of his discoveries; and even the queen, then temporarily sojourning in the convent of San Antonio, would not permit him to depart without hearing from his own lips that epic of the sea, marvelous beyond any fancied and sung by poets in their loftiest flights; and thus he who had quitted Portugal as a poor madman returned thither to be reverently hailed as a demigod. This contrast, more than all else, wounded the heart of Dom John. Every new report of the discoverer stung him like an envenomed dart, and the conviction of his frustrated grandeur racked his brain. The thought that all those pearl-seas and golden lands, those spice-islands fair and stainless as a new-found paradise, might have been his, and had been lost through his heeding not the man to whom he now listened with envy, filled his bewildered mind with plans impossible of realization, and schemes of recklessness and violence strove for the mastery in his halting will. In the course of his conversation with the admiral, the rash thought possessed him that the new islands might belong in reality to him, the conqueror of Bojador and Guinea, in virtue of old treaties with Castile and of papal bulls. But Columbus readily met such arguments with the masterful skill of one in whom the divinities of genius were joined to learning and research. Some assert that in secret, and baffling the scrutiny of Columbus as far as he might, Dom John brought from the caravel an Indian native of the first-discovered island, and bade him show by means of stones and pebbles set in due order the number and position of the islands of that beauteous archipelago. When he saw the great group of the Bahamas and the vast and fabulously fertile Cuba, with Española large as Portugal, beyond reef-girt Salvador, Fernandina with its thrifty tribes, and the poetic isles of Concepcion and Isabella, all coral-rooted in the sea and rearing their crowns of palms heavenward, he was smitten with such despair that he turned against the discoverer all the reproach that he himself alone deserved. Deep, indeed, must his rage have been when his courtiers, ever on the alert to pander to what they divined to be the royal desire, plotted to assassinate Colum-

bus and, seizing his caravel, to brave anew the now explored sea, and to set upon the islands discovered for Castile the standard of Portugal. But some remnant of conscience in the king, and some lingering fear of the Catholic Sovereigns, led him to allow Columbus to depart whither he would, and so he bade him a courteous and ceremonious farewell, charging him with congratulations to the Castilian rulers for the new and marvelous empire they had won.

The delicate sensitiveness of his nature was displayed by Columbus now, as often before, by his turning first to the spot whence he had set sail, thronged though it was with sad memories of his former obscurity and poverty, rather than to the court whence the first aid toward his undertaking had come and where dazzling rewards awaited its success. True it is that the pains and trials whereby success is won enhance beyond measure its material and moral value. The humble stranger-pilot; the wandering Genoese; the obscure sojourner in a petty village of the coast; the plebeian kinsman of an unknown family; the unhappy father for whom his elder son was become a grievous burden through his inability to maintain him as his deep heart's love prompted; the sorcerer, comprehended only by the wisdom of Garci-Fernandez the physician, and the intuition of Fray Juan Perez the penitent, doubtless found in the remembrance of the trials that had so hardly beset him the motives of a higher satisfaction at the fame he had won, and a deeper appreciation of his rank of admiral and viceroy achieved by the heroic force of his will and his inspiration. What countless vigils! What bitter jeers remembered in the solitude of the cloister! What yearnings as he beheld life and hope waning! What of those long days of Juan Perez's mission to Granada? What of his lack of means, even after so favorable a compact as that with the sovereigns at Santa Fé? What of the desertion of his crews, his parting from his child, his last look upon the cliff-set monastery when the unknown wastes were yawning before him, the daring discoverer? Contrast the penitential procession before his setting forth with the triumphal pageantry of his return; that requiem-like mass celebrated by the solitary Padre Juan with the glad "Te Deum" of the crowds that now awaited him; the heart-rending wailings of farewell at his departure with the joyous acclaim of triumph; the scoffs heaped upon his mad schemes with the benedictions attending his assured success; the lamentations of the bygone time with the present rejoicings,—the one is as the day of Calvary, the other as the day of the paschal resurrection! He who had most contributed to the success of the Columbian plans, Pinzon, reached Puerto sadly and alone, and like a hunted felon slunk to his home, to

die! Ah! Martin Alonso fell a victim to his failure to realize the greatness of his share in the work, and to his having coveted the glory of it for himself. How splendid were Lucifer had he not fallen! How great Martin Alonso had he not aspired to be Columbus! He had amassed the wherewithal to complete the equipment of the voyage; assembled by his authority the three caravels and their crews; accomplished the task of organization when even the deputed powers of the sovereigns had been in vain; subdued the disaffected sailors; restored order when all seemed lost, dispelled moral tempests more terrible than those of ocean; shown amid all difficulties exceptional qualities worthy from their very dissimilarity of being ranked with the superhuman endowments of his prescient rival; but all his shrewd foresight, his firmness of will, his patience, his heroic valor, his faculties of administration and command, were commingled with such mad jealousy, such poignant envy, such hostile rivalry, as to drag him to this shameful end and forever to tarnish his glorious life. His quitting Columbus to go in quest of the wealth which the Indians of San Salvador reported to lie hidden in the heart of Haiti was an act of insubordination, unpardonable anywhere, but most so upon the seas when ruin impends if all yield not the most passive obedience. Neither should he, upon his return, have coveted the high laurels due to the greater originator, for even in his subordinate place peerless fame and benefits awaited him. The punishment befitted the deed. When he reached Bayona, in Galicia, near the mouth of the Miño, Columbus was already in the Tagus; when he arrived at the harbor of Saltes, Columbus had already landed long before him, and received his merited welcome. Naught was left Pinzon but to die. Even in that tragical and obscure ending of his woes and his despair, is seen the high resolve of the sailor who faces death as all things else. Columbus perchance might not be overpaid by all that Castile could bestow; but the fault of Pinzon was requited beyond measure. Some, nevertheless, would excuse the pilot's error by the greed of the admiral, who could not brook that any of his sailors might share in the benefits of an enterprise which so conspicuously obeyed the instincts of barter and the lust of gain. From the time of sighting the first island until the last reefs of Española sank from sight, Columbus thought of naught save amassing gold, and spoke of naught save gold. How scanty his inquiries of the Indians in regard to their religion, laws, and customs; how endless concerning gold-mines! He himself confesses that Pinzon, when they parted company, had gathered much gold by barter with the natives, and had distributed it in proportionate shares

among his sailors, reserving a goodly part for himself. But Columbus kept for himself all that he found. Every prospect of profit in his pathway tempted him and called forth his imperious resolve, when he deemed the occasion propitious, to grasp it. He had well nigh lost all at Santa Fé, by his inordinate demands for more profitable conditions. His failure at the court of Lisbon, so propitious a field for all discoveries, is attributed by some to his tenacious and overweening claims for his own benefit in comparison with the share to fall to the crown. He could not even relinquish the paltry prize and slender pittance offered to him who should earliest sight land. There is no doubt whatever that the first man actually to behold the celebrated Lucayan shore, discovered in the morning hours of the 12th of October, was Rodrigo de Triana; yet, because the admiral saw a faint gleam of light in the distance, a fact not even well attested, he appropriated the pension, to the grievous discontent of the good Rodrigo, who, wounded by this attack upon his fame and his pocket, quitted the service of his sovereigns, and went over to the Moors. As the curious volume of his Prophecies<sup>1</sup> shows, Columbus persistently dreamed of buying back Jerusalem from the Grand Turk, but only in the event of his finding seas of pearls, cities of gold, streets paved with sapphires, mountains of emeralds, rivers of diamonds, wealth such as had never fallen to Croesus or Solomon, the treasures of all the Indies far beyond aught that philosopher could compute or even poet feign. The sovereigns themselves discerned these failings in Columbus, when, in writing him the solemn epistle whereby they congratulated him upon his discovery, they first speak of the service done to God and his king, and again of the things he had accomplished for religion and his country, and conclude by referring at considerable length to the profits reaped by the discoverer, his several titles, his numerous benefits, and his enormous share in the revenues to his own behoof. More fittingly should this first letter after the splendid achievement have been a hymn of praise, and not a business reckoning. But it was a reckoning, and not a hymn, because the sovereigns well knew the greed of the discoverer and his disposition to grasp even the uttermost scrap of his bargained privileges. Pinzon, naturally more liberal than Columbus, more generous by national traits and domestic training, free-handed to give, as is shown by the fact of his not having asked even a receipt for the large contributions he brought to the common enter-

prise, must at the last have become vexed at the covetousness of the admiral, and convinced that he would endeavor to turn everything to his own personal advantage and lasting renown. But they who so persistently charge this vice upon Columbus ignore the main characteristics of a nature and temperament such as his, and shut their eyes to the exceptional end where-to he was born and reared. The New World would never have been discovered if to the divine impulses springing from the warmth of a self-contained semi-religious ideal had not been joined the paltry but continuous incentives of more sordid motives, serving to spur the will to vigilant effort and tireless activity. Providence and nature joined in guiding alike the nobler and higher part of Columbus and the lower and more animal part, in order that he might realize an almost fabulous ideal, in obedience to all the impelling mainsprings of the human will. If any one thing be lacking, the totality of the work is marred. These strangely composite men, so lofty, yet so contradictory, while possessing in the higher attributes of their being more of the angel than other mortals, have likewise in their lower traits much more of the animal. These mixed traits were congenital to the men of that time, when the ancient feudal chivalry was expiring and modern mercantile self-interest springing up; to the natives of such a city as Genoa, alike artistic and commercial; to the calling of a sailor, which by its dual aspects looks upon the sea as a temple and a mart, and upon life as a truceless combat and a business transaction; to the artists and learned men of the Renaissance in whom imagination, poetic impulse, the intuitive faculties, sovereign inspirations, esthetic motives, the revelations of philosophy, profound thought, superhuman art, and the worship of the true and the beautiful attained vast proportions, at the expense of morality and conscience,—if I may venture to hint such a thing in regard to a sublime revealer who has even been very generally proposed for canonization.

FROM memory-haunted Palos, Columbus went to Seville and thence by land to Barcelona, where the sovereigns awaited him. It being his good hap to journey through the fairest and richest region of the peninsula, there is no need of telling how he was received by Andalusians, Murcians, Levantines, and Catalans in his triumphal progress. One who has not had the good fortune to witness a Levantine festival can scarce form a conception of the joy of the populace. April having already opened

Indias." To Navarrete and HARRISSE, only the 72d leaf seemed to be in Columbus's own handwriting. It was written mainly in 1501. A summary is in Navarrete's "Coleccion," II., 289.—TRANSLATOR.

<sup>1</sup> This Book of Prophecies remains inedited. The manuscript is in the Columbian Library at Seville—a portentous folio, "two fingers thick," entitled "Coleccion de las Profecias de la recuperacion de la Santa Ciudad de Hierusalen y del descubrimiento de las

when the admiral took his way through that enchanting Eden, it need scarce be said that orange-blossoms showered upon him amid the endless rejoicings, as the applause of innumerable crowds smote his ear. From every wayside nook he could discern through the garlanded almonds and pomegranates his own Mediterranean blue stretching beyond the figs and aloes. Upon his stately entry into any town, the booming of cannon, the peal of bells, the strains of sweet music, the acclaim of the crowds, the clash of timbrels and the melody of lutes, the homage of the civic authorities surrounded by their picturesque alguacils, the joyful halleluiahs chanted by monks and priests in solemn procession, the fragrance of the streets strewn with rosemary and lavender, the portals wreathed with flowers, the house-fronts hung with boughs and the frondage of the cane, the crimson damask and snowy drapery falling from casement and balcony in graceful folds, the countless streamers and banners that waved above, the stretched awnings softening the glare with delicate gleams and grateful shadows, made such a succession of bright pictures as art might strive in vain to represent truly. At length the discoverer drew nigh to Barcelona. The city in its festal attire was a sight to see. All the luxury of the civilization of that day was gathered there in wondrous splendor.

A deputation of nobles had received him beyond the city's gates, and attended him to where the civic authorities stood in waiting, each preceded by his mace-bearer. What a sublime meeting of the Old World and the New! The procession was headed by the crews of the caravels, bronzed by the sun and tanned by the salt waves, exciting popular enthusiasm by their brave sailor-like tread and the vigor of their embrowned features; after came, borne upon men's shoulders, those strange plants so different from any then known among us—the maize with its golden ears, the yet unnamed yucca, the cocoa-palms, the broad-leaved plantain, and the farinaceous tubers we now call potatoes. To this Indian flora succeeded the novel fauna, some living, others for the most part dried and mounted. All were amazed by the manatees, like huge aquatic oxen, the iguanas, like gentler crocodiles, and the sirens, fleshy of body and by no means as lovely as fable tells. Next came the birds, parrakeets of many kinds, with brilliant silken plumage, mounted on lofty perches; and after these, the Indians, on foot, naked and gaily painted with crowns of feathers on their heads and breech-clouts on their loins, much startled at the dismay they themselves caused, yet obedient to the glance and smile of the discoverer, who led them where he would amid the astonished crowd. After the Indians came the

gold, the primitive jewelry, and the strings of seed-pearls given by the caciques, all artfully displayed. Lastly came an attendant escort of the ship's officers, and then Columbus, adorned with all the insignia of his various offices, a true cavalier upon a spirited charger, haughtily erect despite his years, and heedful of every mark of honor shown him, a smile of gratitude upon his lips, the furrows of deep thought upon his brow, and in his eagle glance the reflected splendor of his soul. We need not dilate upon how those Barcelonese, famed for urbanity and finished types of the culture of their day, vied with one another in proving their comprehension of the transcendancy of the incredible event. From the pavement of the streets to the cornices of the houses, a compact multitude was gathered, delirious with an enthusiasm finding vent in never-ending exclamations that, rising and echoing through all the air, spread the electric thrill of a common yearning in which, as it were, the soul of the whole city was condensed. In this poem of the discovery of the New World—an epic indeed, though history must perforce narrate it in prose—the choice of Barcelona for the reception of Columbus appears intentional and not mere chance, for none of our towns had so good a right to usher in the new age of labor and barter as that exceptional city of the toiler and the artisan, whose nautical and mercantile renown competes with the greatest fame of the cities of Italy and Hellas.

Beneath a canopy of rich brocade and upon a throne of Persian fabrics sat the two sovereigns, attended by the most splendid court of all Christendom. Gonzalez Oviedo, the chronicler, with his minute attention to details, says that, even as at Santa Fé he had witnessed the melancholy exile of Boabdil, so now a year and a half later he beheld the triumphal entry of Columbus. And rightly did he couple these memories, for the history of man records few events of such importance. The discoverer dismounted, and advancing, bonnet in hand, beneath the standard he had planted upon the reefs of Salvador in the name of Castile, entered the royal audience-hall, with a deep emotion such as frail human nature could scarce endure. By the royal dais stood the Prince Don John, in whose honor Columbus had given to Cuba the name of Juana, and amid the assembled court were doubtless gathered the great patrons of Columbus, foremost among them the Cardinal of Spain, Pedro de Mendoza. A murmur of admiring surprise greeted the discoverer, whose brimming eyes, quick to discern the pathways of the ocean, could scarce trace his path in that splendid hall. Moved by an irresistible impulse, the sovereigns cast royal etiquette aside, and stood

up, regardless of the usage of the Aragonese and Castilian courts. When Columbus beheld this mark of esteem, he sought to kneel, but Ferdinand forbade him, and, descending from the throne, clasped him to his breast.

A YEAR and a half had passed from the day the sovereigns overcame Boabdil to their reception of Columbus. What a contrast between these two historical events and their central epic figures! On the Vega of Granada perished the olden world of fatalism, and in that audience-hall of Barcelona began the new world of liberty; there despotism sank away, and here the rights of man dawned; beneath Mendoza's cross uplifted on the Vermilion Towers fell the social structure builded upon warfare, while beneath the banner set by Columbus on the coral-reef of Salvador arose another society, which, despite its birth in armed conquest, was soon to be self-converted into an outgrowth of trade and labor. To be scanned aright, social truths demand the far perspective of infinite time and space. Boabdil, setting out with the conquered warriors of the Koran for the Libyan sands, closed the ancient era, while Columbus, returning from the measureless ocean with the simple sons of the world revealed by his mighty genius, inaugurated the modern era. Yet they who had wrought these marvels knew not their full scope or transcendency, and were even unaware that they had in fact found a new world in the ocean, believing that the discovered land was but a spur of the old historical continent.<sup>1</sup> Setting aside the usages of the traditional courtly code, the Catholic Sovereigns bade Columbus be seated in their presence, and speak as he listed concerning his voyage. The discoverer spoke freely and long, repeating as though by rote the record of his journal and the report he had prepared for his sovereigns. A humble recognition of God's aid and of the help vouchsafed him by God's royal vicegerents on earth fitly prefaced his well-arranged discourse. The facts being set forth in orderly sequence, he gave due prominence to the more important features of his divine Odyssey, and to the emotions aroused in his mind by his sudden meeting with yonder virgin isles of beauty. Columbus spoke much of the gold he had obtained, and cast ardent eyes upon it as a promise of more to come. But, even as he was unaware of the true geographical position and

immeasurable vastness of the archipelago he had found, so he divined not the potent factors he had added to interchange and trade. Had one set before his eyes the new productions so fraught with blessing to mankind, such as the febrifuge we call quinine, hidden on the mainland he had not reached but was soon to discover, his genius, now blinded by the glitter of gold, would have foreseen other and incalculable advantages to flow from his achievement. He knew naught of the bread made from the rich ears of the maize, nor the worth of the food-bearing but unsightly potato, now so indispensable to man's life. Who could have foretold him the future of tobacco? He saw it first in Cuba. Certain Indians carried it, rolled in dry leaves and lighted at one end, while they sucked the other end, and so regaled themselves with the smoke. How could he have forecast the part that leaf and its smoke were to play toward the enjoyment and the revenues of the civilized world in both hemispheres? With gaze reverted to the past, Columbus believed that all these lands had fallen under the dominion of our Spain to revive the crusades of the feudal ages, when they were in reality destined, in the plan of divine providence and in the development of human progress, to renew society as they had renewed life. But the onlookers of his time shared not such fancies. Columbus yet believed that Cuba was a part of the Asiatic continent and that the second expedition to be sent to the shores of Cuba and Española, with more and better-equipped vessels than the first, would attain to the kingdom of Cathay, the golden city of Cipango and the realms of the Great Khan, all rich with priceless gems. Whatever his inward beliefs, he could not for an instant doubt that the Church, thanks to his discovery, would win many souls and the State new subjects, while the Spanish nation should stretch out beneath new skies and through new seas to other virgin lands, as though God had willed to reward his faith and constancy by another and immaculate creation. How fitting, therefore, that upon the completion of the discoverer's story, a celestial chant should arise in mystic cadence, bearing to heaven's heights a glorious "Te Deum," voicing the emotion that possessed all hearts in that marvelous moment, when it seemed as though God and mankind were reconciled by the restoration of the lost paradise.

*Emilio Castelar.*

<sup>1</sup> A belief not even dispelled by the results of the later voyages. See the interesting document entitled "Informacion y testimonio de cómo el Almirante fue á reconocer la Isla de Cuba quedando persuadido de que era tierra-firme," drawn up on the *Niña*, June 12, 1494,

by the notary Fernand Perez de Luna, in which the officers and seamen testified, by request of Columbus, that Cuba was, indeed, a part of the mainland of India. (Navarrete, "Coleccion," II., 162.) Cuba was first mapped as an island by La Cosa, 1500.—TRANSLATOR.

# THE CHATELAINE OF LA TRINITÉ.<sup>1</sup>

IX.

BELLAGIO: THE GODDESS MANIFEST.

THE interval between the reunion at the gateway of Juliet's garden and the ceremony at her tomb was brief, but it had been long enough for Aurelia West to inform Tempo-Rubato that the acrobatic fantasy at Iduelegni had had other witnesses than those to whom it had been especially addressed, and pointedly to intimate to him that it might be proper for him to declare his real status before the present occasion was much older. She had been as peremptory as she dared, and had awaited his explanation with the air of one who has brought up a delinquent with a good round turn. But Tempo-Rubato had been in no wise abashed or embarrassed, or even inconvenienced. He had simply laughed loud and long,—a laugh to flood a shrine with profanation,—and had asked them (all three, impartially) what they had thought of it, anyway. There had been no denial, no subterfuge, no palliation, no explanation whatever; and they were simply left to feel that this erratic person must be allowed the widest claim he cared to make,—must be granted full freedom on the highest plane he chose to occupy,—and dumbly wonder under what aspect he would see fit next to present himself. This next aspect was offered at Bellagio, and presented a transition from apple-green fustian to navy-blue serge. Our two young ladies were just ending a morning's loitering stroll on the terrace of their hotel, when a small craft happened to pass by within a hundred feet of the shore. It was one of the kind common to the Lake of Como, but was gilded, curtained, and upholstered to the verge of the operatic. The glorious azure plain of Como might straightway have become a mere muddy puddle, and the towering crest of Crocione but a bald and inconspicuous mound, and the smiling undulations of the Tremezzino simply the flat vacuity of a prairie farm, for all the heed that Aurelia West now

<sup>1</sup> Copyright, 1891, by Henry B. Fuller.

gave them; for the craft before her was impelled by a young man in the garb (full-rigged, and more) of a sailor,—widening trousers, a low, broad-brimmed straw hat, a wide, low-cut, anchor-embroidered collar, a gold-fringed sash of white silk,—and the passenger was a lady who lolled back under the same parasol that had illumined the quay at Lucerne, and who lazily admired the quick and supple muscularity of her ornately attired companion.

Aurelia asked the Governor at lunch if he considered the *salon* of their hotel at all adapted to the giving of a concert. The Governor sent out a questioning look full of startled apprehension, as if to inquire what was in the wind now. It was the look of a man who feels the ground shifting beneath his feet—of a man whose recent experiences have made it worth his while to wonder what will happen next. He had entered upon this little tour simply as a quiet scientific gentleman whose tastes were subdued and whose requirements were extremely moderate, certain that what was good enough for him was good enough for the unexacting Chatelaine, and that what would please them both would assuredly suffice for their guest. But at just the present moment his status was something of a puzzle to him. It seemed now and then as if his eyes caught distant glimpses of the flaunting of banners, as if his ears detected remotely the half-smothered clamor of trumpets, as if his nostrils were being tickled by fumes wafted from invisible censers, and there were hours when their modest little excursion seemed to have merged into something almost equaling a progress. And one day, after an hour's quiet cogitation in a retired corner of the garden, he became satisfied as to the identity of the chief figure in this triumphant march—reaching the result by a process of elimination. In the first place, it was not he himself. True, there were moments when he felt that the cheeks of the genius of Fame showed a tendency to distend themselves unduly on his account; he was daily hearing himself addressed by new and ingenious titles supposed fittingly to recognize his eminence, and this eminence had been further confessed by unexpected attentions from various officials in the minor towns lying between Verona and Milan. Yet, on the other hand, he often felt himself degraded almost to the level of a lackey: it was fetch and carry, do this and do that—a long and unceasing string of minor attentions which Aurelia West expected and demanded, and in which even the Chatelaine, careless of her gray-haired guardian, completely acquiesced.

In the second place, the chief figure of the progress was not their guest from Paris. True, she was showing an increasing disposition to flaunt her magnificent apparel here, there, and

everywhere, in places high and low, in season and out, and she was developing a capacity for haughty insolence toward hotel-keepers and their dependents that almost chilled the old gentleman's blood. But, on the other side, for every inch that she exalted herself in public she would humble herself a foot in private; and when the Governor had seen her a few times running about nervously with her mouth full of pins, and had once encountered her in a dark hallway with a shoe of the Chatelaine's in one hand and a tiny blacking-brush in the other, he saw that Aurelia West was not burning to be the Princess, but only the Princess's devoted slave.

There was only one of them left—the Chatelaine herself. It must be for her, then, that they had given up their quiet and pleasant inn at Verona, and had transferred themselves to another, larger, showier, more expensive. It was for her that *Fin-de-Siècle* was always being sent trotting about for carriages and coachmen, that *Tempo-Rubato* would be despatched for *ciceroni* and *sagrestani* to open up famous places at distinguishedly unusual hours, and that Aurelia West had so willingly metamorphosed herself into a lady's-maid. It was for her that the hotel-keeper at Brescia had bowed down with obsequious devotion, and that the half-dozen eager waiters had tumbled over one another's heels; it was for her that the *sindaco* of Bergamo had driven up to the door of their inn with a carriage and pair; it was for her that he himself had been left to spend three dismal days in the Brera at Milan, staring at casts, coins, and madonnas, while Aurelia organized and led a triumphal tour among the shops of the Corso and the Galleria. The Governor studiously contracted his eyebrows as he stared through the white walls of Cadenabbia across the lake, and rubbed his nose thoughtfully with his long forefinger. Well, after all, the dear child was worth it.

But he might have spared himself an uneasy apprehension that the indefatigable Aurelia was designing to organize an entertainment at the hotel with the Chatelaine as chief patroness, and Aurelia, too, might have spared herself any apprehension that Des Guenilles was intending to duplicate here her performance at Meran; for the Duchess had dismissed her three or four remaining voices, and, having thus stripped herself of the last shreds of *opéra comique*, was indulging in a fortnight of unadulterated rest preparatory to her autumnal engagements in Paris itself. Meanwhile, she was established in the other big hotel at the far end of the town, and was daily doing Cleopatra-on-the-Cydnus, as far as circumstances and surroundings permitted—the resemblance being greatest, of course, on those occasions when Antony was

not required to furnish the motive power as well as the devotion.

But the lake was free to all, and its shores were made accessible by frequent steamers. Aurelia twice covered the course from Como to Colico, and once she made a side-excursion down into the arm at the end of which stands Lecco; and on all these occasions she passed the panorama in review with the ferret-like, undeviating gaze of the specialist. The sheer fall of mountain-side, and the white tumbling of cascades, she viewed with complete indifference; the busy activities of quarry and silk-manufactory were so completely ignored as even to pass unresented; the fine picturesque-ness of church-tower and monastery was taken in unconsciously, if at all, while the crumbling walls of untenanted castles and fortresses seemed to strike her as anachronous to a degree: but for every distant glint struck by the sun on balustraded terrace, for every glimpse of pediment or colonnade caught through groves of cedar and magnolia, her eyes were keen indeed. In fact, Aurelia's sole concern in all this was to discover a villa ideally suitable for the enigmatic son of the Duke of Largo. Before long she did discover it, but not from the deck of the steamer.

For, on a certain afternoon, one of the insinuating boatmen of Bellagio, with more heed to profit than to meteorology, had tempted our friends out upon the water at a time when the prospect for wind and rain seemed more than commonly good. Within half an hour the prospect became a certainty, and a strong wind and a high sea drove them straight to shore. They effected their haphazard landing at a flight of broad and easy marble steps which broke through a long and stately terrace to lead down to the water between rows of sculptured vases rioting with flowers, and which led up to avenues of box and clipped ilex adorned with multifarious statues. And when a brilliant figure in white flannels came hastening down one of these stately paths to assist them in alighting, the transported Aurelia rose at once to the situation on the wings of ecstasy: here at last was indeed the villa of Tempo-Rubato, and it was the master himself who had come to welcome them. Tempo-Rubato knew nothing of this ecstasy, but he had a sharp sense of atmospheric conditions; yet with all his haste to get the Governor and his charges under shelter, he had barely done so before the storm broke.

It was sharp and sudden, short yet violent; a gusty roar, an ominous lashing of waters, a heavy downpour, a touch of thunder and lightning; then the infuriated beauty quieted her heaving bosom and veiled her flashing eyes, and bound down her flying hair and stilled her angry clamor, and presently Como, save for a

murmur reminiscent of rebellion, was herself again. Within a quarter of an hour the sky was clearly blue, and Tempo-Rubato walked forth with his guests, accompanied by his parents, who were spending a month with him in *villeggiatura*, and by Fin-de-Siècle, who had sprung up from somewhere or other, and who announced himself as on his way back to Paris. The broad, graveled walks trickled with their last rivulets, the polished masses of box and laurel tingled with a million raindrops, the white walls of villas and hamlets glistened on many a remote mountain-slope, and a full-arched rainbow hung out its flag of truce from shore to shore. Through this scene Tempo-Rubato, fully *en prince* at last, led the way with an air of easy and gracious mastery. The Chatelaine was simply enchanted by the spectacle, and did not hesitate so to express herself. As for the splendors of the villa itself, they impressed her almost to the verge of discomfort. The pictorial stateliness of the Vintschgau had not been without its effect upon her, but the difference between that and what she had previously experienced had been only one of degree. Here, now, was a difference of kind; never before had she encountered anything so suave, so luxurious, so spaciouly serene, so indolently graceful. Every glimpse of cloud-wreathed mountain-peaks seen down long avenues of ilex overawed her; every glance at the blue expanse of waters caught through openings in stuated and arcaded galleries acted only as a spur toward the adequate expression of her delight.

This undisguised appreciation was not at all to the taste of Aurelia West, who did not care to have the Chatelaine show herself so completely pleased, so powerfully impressed. She herself accordingly drew on a weary and half-disdainful air, as if her own infancy and childhood had been passed in villas of uncommon splendor, and as if she had tired of all such long years ago. She entered upon a quiet little course of disparagement by means of cross-references to other travel experiences: she drew upon the outskirts of Vienna and the environs of Paris, where, as she more than intimated, features of equal magnificence were not altogether wanting, and she reminded the prostrate Chatelaine of one or two rather fine things in the ancestral home of *Zeitgeist* that found no fellows here. Propped up by such aids as these, the Chatelaine was not completely bowed and broken by Tempo-Rubato's grandiose environment; but she went through an ordeal which tried to the uttermost their united fortitude when the Marchese summoned them subsequently to a grand fête, when moonlight, music, fireworks, and what not besides, combined nearly to vanquish this simple-minded

girl and even to modify the *nil admirari* attitude of her friend.

The Governor found himself at home among the serried nymphs and goddesses of Tempo-Rubato's freshened elysium,—personages whom the old Duke pointed out as well as he knew how,—and he jotted down with some nimbleness one or two little notions that he fancied might do very nicely at Avenches. He even begged from Tempo-Rubato a slight pencil-sketch of the uncommonly effective landing-stage, from which to complete his own new *marmorata*, and he carried away a ground-plan and a perspective view which their host cleverly slap-dashed down on a page torn from his note-book. Fin-de-Siècle, too, scratched down his own little impression on the sensitive mind of the old gentleman, when he informed him, at one stage of their progress through the grounds, that he had just despatched his last chapters to Paris. This was done in a tone most marked, one sinister and even threatening; and the Governor, whose mind sometimes moved with a bounding intuition that was little less than feminine, instantly saw himself figuring upon the pages of a book, and none too flatteringly either. He sighed and shuddered. Were all the rites of hospitality powerless to exorcise the demon of publicity? And if he himself figured among the *dramatis personæ*, how about his associates? If he were the *père noble*,—or ignoble, as he rather feared,—how, then, as to the heroine?—an inquiry that he trembled to pursue.

But this ominous thought would now and then flap its dusky wings about his head as they loitered along through thicket and greenhouse, for Fin-de-Siècle had fixed a most intent regard upon the Chatelaine, and kept it there. Aurelia, never completely certain heretofore of exemption from a snub from this quarter, now found herself swiftly fading into nonentity. She undertook to revivify her own image in the mind of this contemptuous youth by reverting to certain episodes common to the Parisian experiences of them both; but some of these he ignored, and others he had forgotten, or had so far forgotten that it would be weariness to remember. Aurelia was willing, under certain conditions and for certain ends, to humble herself, but she was not yet quite ready to be humbled by anybody else, and she resolved to lie in wait until occasion might hold out the prospect of solace to her mortified spirit.

Such an occasion offered itself almost immediately—perhaps you will say she made it. It was in the largest of the greenhouses—the central one—that she found an opportunity at once to reassert her own importance and to exalt still higher the already exalted Chatelaine. Under a great octagonal dome of glass, focus

of Tempo-Rubato's horticultural endeavors, was set a small, stone-encircled pond, the surface of which was half hidden by the big, flat, lustrous leaves of some rare plant which had brought all its energies to one surpassing focus of its own—a single, great, white flower of transcendent purity and splendor. Aurelia's hands at this very moment were cumbered with flowers that Tempo-Rubato had presented to her,—flowers of but moderate rank, it is true, but distinguished by the giver and his giving,—nor had the Chatelaine been altogether forgotten by the doting old Duke; but nothing like this prevented Aurelia from fixing a determined gaze on that one unique and precious blossom—a gaze that passed from Tempo-Rubato to the Chatelaine and back again, but began and ended in the center of the pond—a gaze wide with expectation and prophetic of demand. And then she spoke—with a slow and distinct deliberation. This magnificent flower, she said, had doubtless been waiting for the coming of the lady on whom it could properly be bestowed. Well, the lady was here (this with a bow toward the Chatelaine that was almost a reverence), the Lady of La Trinité.

There was a slight pause, and in it was faintly heard the whirring of the wings of panic. Tempo-Rubato gave a start and a short, nervous laugh, the Duke paled perceptibly, and the Duchess, with a moist fear in her eyes, laid a detaining hand upon her son's arm; even Fin-de-Siècle gave a quick little gasp. The Governor should have done as much or more; but he simply looked in a fond, doting way upon the Chatelaine, as much intoxicated by this flattery, as much uplifted by a sense of coming triumph, as were he himself the principal—too sensitive to the fumes of the ideal to give due heed to the lees of the actual, however certain they were to remain behind. As for Aurelia, she realized pretty nearly—though not completely—what she was about; she had entered upon a course of splendid audacity, and this step was only a little longer and a little bolder than any preceding one; she honestly believed her friend conspicuously deserving of the best which could be offered; that blind old man had allowed his godchild to disparage herself too long already.

Every one turned to the Chatelaine, but she made no effort to stay the execution of this high-handed decree. She was modest and reasonable enough, but she was too human to be above homage, and too inexperienced to interpret signs and tokens, however open and abounding. She should have taken Tempo-Rubato's strained bow and forced smile not as a sign of acquiescence eagerly courting encouragement, but as a plea for the averting of a

ruthless sacrifice. She should have seen, from twenty indications, that this one flower was the apple of his parents' eyes, and that to pluck it was like quenching the flame in a lighthouse, like snatching the halo from some saint. A month before she would have shrunk back from so marked an attention, but whiffs of a new atmosphere wafted from afar and laden with adulation now tickled her dilated nostrils; a claim made not by herself, but by another on her behalf, might surely hold; so she stood there quiet, smiling, acquiescent—if her look expressed anything, it expressed a wondering inquiry as to the reason for delay.

Tempo-Rubato set his teeth, and moved toward the edge of the basin. Aurelia advanced a step, and begged him not to inconvenience himself. To pluck the flower was a privilege, and nobody would appreciate this privilege more highly than Count Fin-de-Siècle; she begged that he would stand back in favor of his friend. But Fin-de-Siècle, thus suddenly brought forward, did not seem very successful in summoning up a look to express his sense of the honor. He glanced timorously at the turbid fluid as it revealed itself obscurely between the curled and huddled pads—a surface that gave no precise indication of depth and positively no information as to the nature of the bottom, which was very likely to be both curving and slippery. The Governor chuckled and encouraged the young man's advance; it was not through fire and water that he was asked to go,—hardly water alone; mud, rather,—and it did not become him to stand too long trembling on the brink. Aurelia, with a mingling of the spiteful and the romantic, tauntingly assured him that every good and true knight held himself in readiness to obey the commands of the sex, and that promptness was half the service. Tempo-Rubato gave audibility to a sardonic smile by means of a short, dry laugh, and laid a propelling hand on the shoulder of his hesitating friend. He himself was to be a victim, but there was some satisfaction in the thought that he was not to be the only one. He was to suffer, indeed, but with dry feet and an unimpaired self-respect.

The Chatelaine received the flower with a gracious serenity. She did not lay too much stress on Fin-de-Siècle's ruined shoes and muddied trousers (he had been obliged to sink on one knee to escape falling flat on his back), nor did her eye dwell too long on the broken pads that remained floating about as witnesses of the struggle. Aurelia fixed a studiously indifferent gaze on a plebeian plant which occupied the nearest ledge, determined to exclude the noteworthy and the exceptional. The Duchess turned toward her son as if to ask what angel—what destroying angel—they were entertain-

ing unaware. His glance in return seemed to imply the uselessness of denying that she was an angel when even the imps from the lower world acknowledged and proclaimed it.

The complacency of Miss West metamorphosed this dragonade into a tribute and a triumph; but she had always been taught to expect a great deal of men, to express her expectations unreservedly, and to insist most vigorously upon their fulfilment. It was her fundamental belief that the young woman was the corner-stone of the social edifice,—the *raison d'être* of society,—almost its be-all and end-all. The spokes of the social wheel all centered in her; toward her every function worked, from her many a function proceeded; she both guarded the gates and sat on the throne—at least that was the way it was in America. She knew that Americanization was the impending fate of Europe, and she felt that she must do her share in this great work. Why did she hold a string in her hand if she was not to pull it? Why neglect the cultivation of a precious bulb the coming convolutions of which promised to out-flower Flora herself?

In the mean while she continued her collection of data with regard to remote and nebulous La Trinité. For remote and nebulous indeed was it coming to seem through the responses of its mistress, who met Aurelia's constant and confident interrogations with answers that seemed cold and meager and almost evasive. She seemed unable squarely to face Aurelia's ardent assumption that the splendors of the Vintschgau and the Brienza were to be equaled in a remote and lonely Alpine valley; that poor, homely La Trinité was to rival Meran and Bellagio. She acknowledged her own château, an inn too, a mill, a church, a certain number of chalets; but her responses were quite unadorned by details. As regarded her own habitation, she would confess to a turret or two (Aurelia had imagined a dozen); there was a window, yes, which might fitly be termed an oriel; as for a courtyard, there was a kind of inclosure near the stables which might as well be called that as anything else; and as for a driveway from the village up to her own grand portal (Aurelia's expression), there was a road on which a coach would be practicable, perhaps, though hardly necessary. With these meager particulars the poetess was obliged to content herself.

The matter of the divinity's material environment remained, then, in abeyance, but of the new spirit informing her the delighted Aurelia soon received a token convincing enough. It was near that little open place by the steamboat-landing on which opened the great gates of their own hotel; a place where splendid boatmen lounge with the effect of leaning up against

side-scenes, where strapping young women kneel on the shore and cleanse their towels and table-cloths with a great whacking of wooden paddles and an immense sacrifice of soap-suds, and where lively little girls clatter along under the arcade in loose wooden slippers which only a miracle in constant force seems to keep on their feet. To this place the Chatelaine and her friend had descended from one of the steep and stony little lanes that mount the hillside, and were beguiling their leisure by a few infinitesimal purchases, when another pair came strolling along with a careless and leisurely gait— *Tempo-Rubato* and *Mademoiselle Pasdenom*. The Chatelaine was moving on toward a tiny shop before the door of which hung several very neatly turned specimens of the cobbler's art in poplar-wood and tinsel velvet; but at a sign of greeting from the approaching pair she paused, and Aurelia was presently enabled to gage the amount of progress that had been made between Lucerne and Bellagio.

The Chatelaine had never crushed anybody before. She had never felt an impulse to do so, and she might not have been able to follow up such an impulse to a relentless consummation. But now, to Aurelia West,—though Aurelia, remember, could sometimes see more than there was to see,—no one could have seemed more suddenly, more inflexibly, determined to rend, to cast down, to trample upon, to annihilate—more unmistakably risen at last to an eminence which disclosed to her the full knowledge and significance of her place and her powers. But if the Chatelaine had taken an instant to reflect or to discriminate, she might have refrained from a full and ruthless exercise of those powers. The Duchess did, indeed, nod in a familiar fashion to Aurelia, but her manner toward Aurelia's companion was propitiatory, self-derogatory, almost appealing. Certainly, considering the company and the circumstances, this was no place for abject and groveling humility; she could hardly be expected openly to abase herself before *Tempo-Rubato*. But the Chatelaine was bursting with a capacious indignation,—an indignation which even made Aurelia West seem less a victim to this woman than her fellow-conspirator,—and she was far beyond the consideration of finely shaded details. She was of good height,—taller than either her friend or her foe,—and a sense of rectitude turned every inch to its fullest account. There was a great capacity for indignation in her full bosom, and for inflexibility in her squared shoulders. Her well-set, uplifted head was easily equal to the expression of a high degree of pride, and its slow turning to one side raised the expression even a degree higher still; while the nervous concentration of the play of her long fingers on her elbow remained a study for the fascinated Aurelia for a week afterward. Her nose, aquiline and cartilaginous,—like those of a long line of ancestors, persons of probity and consideration,—seemed equal to the expression of any degree of scorn; and her eye, when unveiled, was the eye of the mountaineer, whose penetrating and hawk-like vision is never more steady and steely than when fixed on some small and remote object that is retiring to a remoteness greater still. And when she spoke,—

only a dozen words,—she employed a primitive directness that startled and confounded.

The Duchess drooped. The careless and scornful little laugh that she attempted ended suddenly in something like a mortified sob. *Tempo-Rubato*—to fall back upon a convenient metaphor—placed an instant hand on the hilt of his sword, while the other devil—not the laughing one—began to glitter in his eye. He had not, perhaps, the clearest idea in the world in whose behalf the weapon was to be wielded, but it was foreign to his nature to play passively the part of spectator: choice of sides was not so urgent as exercise of activity. But there are times when the most eager warrior must chafe under inactivity, when even the brawniest arm is paralyzed by circumstance. For though the Chatelaine turned on him a lofty look which flashed him far beyond the pale of any possible alliance with her, it was a look the fierceness of which forbade at the same time his open championship of the opposing side. However, she gave him scant opportunity for either. She passed rapidly on, and he was left, with a feeling of admiring wonder, to reflect that it was this girl whom he, only three months before, had presumed to treat with something but little removed from an amused and condescending indulgence.

## X.

## LA TRINITÉ: MIRAGE.

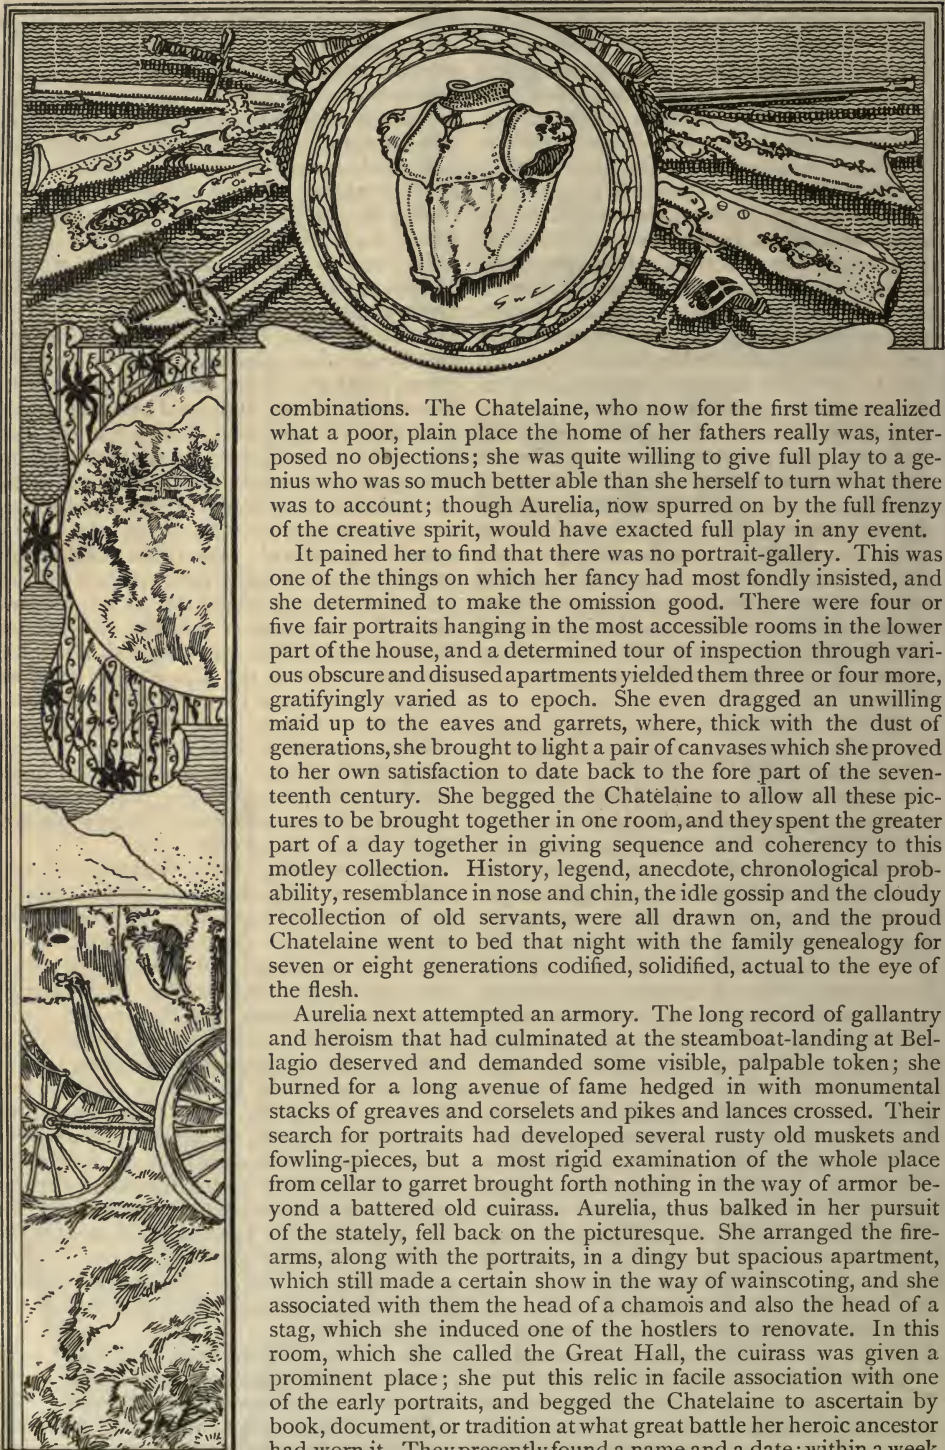

THE road up the Val Trinité begins with the suave and persuasive promise of chestnut and laurel, and ends in actuality with a dozen riven pines at the jagged and splintered base of a great glacier. The track runs between rugged slopes the bases of which are littered with moss-covered boulders and with scaly rocks overgrown with thickets of rhododendrons, crosses and recrosses a brawling torrent whose excesses become more unbounded with the advance of every half-mile, and passes through a dozen scattered hamlets the inhabitants of which change almost imperceptibly from Italian to German, but whose names remain obstinately French. And it was over this road that a carriage jolted one afternoon late in September, carrying the Chatelaine, her guest, and her duenna, old Mamzelle Margot, who had conducted her charge from La Trinité to Neuchatel, and who had now come down from the mountains to lead her home again.

The Chatelaine's home-coming was a very simple and unadorned affair, but it involved no particular disappointment to her romancing friend, who had fortunately prefigured that very little appreciation was to be expected from an uninstructed peasantry when so little had been accorded, within her easy recollection, by even

the lights of the polite world. She knew, of course, what was right in this connection, what might properly be expected, demanded. Her intimate acquaintance with light opera and lighter fiction made it impossible for anything to quench her ideal—an ideal involving a gay and graceful commingling of festoons and arches, of bonfires and hurrahs, a complaisant and unanimous throng before the inn,—a throng in gay bodices and sturdy leggings, with a ready tendency to drink healths with cheers and to flaunt gaily streaming ribbons with an airy abandon; but she was willing to accept whatever offered at present until enlightenment might dawn upon these well-disposed but uninformed mountaineers, and they could be shown what was to be done and given some idea of how to do it. It pleased her well enough, then, that a score of men, young and old, collected in the street, should have parted for the passage of their vehicle, and have ranged themselves almost involuntarily in two irregular lines, and have uncovered with every evidence of respect and good will. It gave her considerable satisfaction, too, when a group of half a dozen little girls came trudging up to the château with a big nosegay of homely and belated flowers, and shuffled their feet with a helpless awkwardness until the Chatelaine's gracious acceptance relieved them of their embarrassment and sent them away with a proud and smiling satisfaction. Nor did she find it amiss when, the next morning, a wheezy old dame shuffled in with a basket of eggs and a pair of stockings of her own knitting. There was material in all this, and promise.

To the place itself she gave the same qualified approval. If position was half the battle, as she had heard, the battle was half won, for the château stood on a rugged eminence a hundred feet above the village, and commanded a wide sweep of snowy peaks that rose above serried ranks of somber pines. But that its own actual features, external and internal, were equal to crowning the campaign with victory was not so certain. Should she be able to produce any broad and taking effects in a place so small, so simple, so domestic, so generally practicable for the ordinary living of to-day? Could she hope for stateliness in apartments so circumscribed? Was there really any opportunity for the grandiose with furnishings so meager, so familiar? Would it be possible to produce any great impression with such a plain and homely little band of servants? Well, she must do the best she could.

She at once entered upon a deft and half-disguised course of manipulation. She advised, suggested, importuned, experimented. She changed, shifted, added, took away, renovated, reconstructed, made new presentations and

combinations. The Chatelaine, who now for the first time realized what a poor, plain place the home of her fathers really was, interposed no objections; she was quite willing to give full play to a genius who was so much better able than she herself to turn what there was to account; though Aurelia, now spurred on by the full frenzy of the creative spirit, would have exacted full play in any event.

It pained her to find that there was no portrait-gallery. This was one of the things on which her fancy had most fondly insisted, and she determined to make the omission good. There were four or five fair portraits hanging in the most accessible rooms in the lower part of the house, and a determined tour of inspection through various obscure and disused apartments yielded them three or four more, gratifyingly varied as to epoch. She even dragged an unwilling maid up to the eaves and garrets, where, thick with the dust of generations, she brought to light a pair of canvases which she proved to her own satisfaction to date back to the fore part of the seventeenth century. She begged the Chatelaine to allow all these pictures to be brought together in one room, and they spent the greater part of a day together in giving sequence and coherency to this motley collection. History, legend, anecdote, chronological probability, resemblance in nose and chin, the idle gossip and the cloudy recollection of old servants, were all drawn on, and the proud Chatelaine went to bed that night with the family genealogy for seven or eight generations codified, solidified, actual to the eye of the flesh.

Aurelia next attempted an armory. The long record of gallantry and heroism that had culminated at the steamboat-landing at Belaggio deserved and demanded some visible, palpable token; she burned for a long avenue of fame hedged in with monumental stacks of greaves and corselets and pikes and lances crossed. Their search for portraits had developed several rusty old muskets and fowling-pieces, but a most rigid examination of the whole place from cellar to garret brought forth nothing in the way of armor beyond a battered old cuirass. Aurelia, thus balked in her pursuit of the stately, fell back on the picturesque. She arranged the fire-arms, along with the portraits, in a dingy but spacious apartment, which still made a certain show in the way of wainscoting, and she associated with them the head of a chamois and also the head of a stag, which she induced one of the hostlers to renovate. In this room, which she called the Great Hall, the cuirass was given a prominent place; she put this relic in facile association with one of the early portraits, and begged the Chatelaine to ascertain by book, document, or tradition at what great battle her heroic ancestor had worn it. They presently found a name and a date; within a week

the new relative was firmly embedded in the mind, the heart, and the memory of the last of the race; and before a fortnight had passed she had made a dozen facile but proud allusions to the great glory of her house. Nor did Aurelia pause here. She revised the personnel of the place from Mamzelle Margot down. Mamzelle constituted something of a stumbling-block in the pathway of progress, and Aurelia employed considerable finesse in her attempt to raise this sturdy and homely person to the grade of lady-companion. She established a scheme of precedence among the maids; she ranked the stable-men and gardeners; and she spent considerable time and thought in contriving a suitable envelop for the Chatelaine herself. Using one of the Milan gowns as a basis, she created a costume which she succeeded in persuading this guileless girl was in the height of the present mode, but which was indeed only a discreet little variation of her own on the fashion of the High German Renaissance—the days of Maximilian, in fact. It was a garb marked by puffs at shoulder and elbow; it included a girdle from which hung a bunch of jangling keys; and it was finished with a close-fitting little cap of gold mesh worn well on the back of the head. It embodied the typical, the representative; it was a present token of power, importance, proprietorship; and when men and maids alike gazed on this new apparition with an admiring deference and awe as it trailed in slow state through hall and garden, Aurelia felt that she had not labored in vain.

The respite that followed these labors was not so long as their arduousness required, for word came shortly from the Governor, who had lingered behind at the lakes, that he would come on within a day or two and would bring *Zeitgeist* with him. Aurelia immediately shifted the barrel and resumed her work at the crank. Her opening measure related to the conveyance of these visitors up the Val Trinité. They should be met, and met, too, with a more creditable equipage than the one which had been found waiting for the Chatelaine and herself—an equipage for whose rusty harness and livery-less coachman she had chidden Margot as severely as she dared. She argued insistently from the past glories of the house the presence somewhere of some state-coach or other, nor did she rest until, in a remote annex to the stables, she found a dusty and battered vehicle whose faint traces of cracked carvings and dimmed gildings dated back to the old rococo days. She herself undertook the rehabilitation of the moth-eaten cushions; she insisted to Mamzelle Margot, temporarily reduced to her old position of housekeeper and general manager, that the harness must be refurbished up; and she asked the Chatelaine what were the colors

of the traditional livery of the house, so that when they drove down the valley to meet the Governor and his companion,—Vittorio on the box, Franz and André up behind, and all three vivid in the facings that Aurelia's own needle had stitched into place,—they offered a spectacle to which the scattered hamlets of the Val Trinité had had no parallel for sixty years—one that for the like of which only the oldest of the elder generation of peasantry had any place in their memories.

The Governor had once before visited La Trinité, some years back, and he was not slow in observing the changes that had come between. He had not been received, then, *en grand seigneur*; no flag had been flung out from the topmost turret (another of Aurelia's ideas) as they had passed upward from the village; nor had the natural simplicity and *bonhomie* of the place been obliged to force its expression through a cumbersome overlay of stiff formalities. The primitiveness of that early day compared with the ornate complexity of the present one as the naïve piping of strolling players compares with the strong, broad, determined chord that sometimes begins an overture. Aurelia West, he saw, had collected and organized the scattered potentialities of harmony, and was now leading them on with an irresistible sweep, and with a keen eye that took in the whole semicircle from double-bass to kettledrum; while the Chatelaine lay back with the pleased passivity of the lady-patroness in her *loge*.

But the Chatelaine's part presently became a more active one; she was led on to sing the leading rôle, and before an increased audience. When Mamzelle Margot came in one morning with the intelligence that two gentlemen were stopping below at the inn, Aurelia, whose powers of divination were quite equal to her powers of imagination, knew without the telling who they were. And when Tempo-Rubato and Fin-de-Siècle presented themselves in the dress of hunters, she did not need to be informed that they had worked their way along the mountains from the shooting-box above Bergamo, and that their ultimate destination was Paris. The idea, of course, was Tempo-Rubato's. Fin-de-Siècle, since his discomfiture at Bellagio, had no desire to expose himself to any further risk, and he was finding their rough scramble over the mountains a good deal of an ordeal, being less the hunter than the mere urban sportsman. But Tempo-Rubato had pushed all opposition aside. He was determined upon once more seeing the Lady of La Trinité; the only person capable of interesting him was the one who could jog his imagination. No woman before had ever checked or cowed him; he would view the leopardess in her own lair.

The Chatelaine received the newcomers in that great hall which Aurelia West had created for her. Her air, to Tempo-Rubato, seemed full of a chill stateliness, yet hardly designed as the protest of injured dignity. The Chatelaine's indignation, in fact, had been much less directed against Tempo-Rubato than against the Pasdenom, and her forbidding aspect was now assumed principally as a help toward holding her own. She knew that her home, despite the embellishments of the revolutionary Aurelia, was a poor place still, and far beneath any possible comparison with the great houses that had entertained her, and she was relying less upon her material environment than upon her inner consciousness. The portraits, the trophies, and the *hauteur* of Aurelia gave her some support, it is true; but in the end she was herself, and that was enough.

The stage being set, and the performers brought together, Aurelia now proceeded to the play. It was impossible to make this as impressive, as ambitious, as she desired, but here, again, she should do her best. No great fête was possible—there was no one to summon. The only persons of any consideration that the community yielded were the priest and the schoolmaster, and the Chatelaine had no neighbors. But a dinner could easily be accomplished; the guests were already on hand. It must be small, but it should be too stately, too elaborate, for any intrusion of the informal, the familiar. The most satisfactory thing that Aurelia had found about La Trinité was its service of plate, and she arranged a menu fit for the dishes. It was drawn up on the best Parisian models, and was partly carried out by Aurelia's own efforts, for its succession of courses, its divisions and subdivisions, went far beyond any notions entertained in regard to dining by Mamzelle Margot. Together they explored the cellar for wine in which the Chatelaine's health might be drunk: a ceremony for which the Governor (prompted by Aurelia) took the head of the table, and with alacrity. This attention the Chatelaine received with no false modesty, no self-deprecating shrinkings, but with a high and serious sense of acknowledging a just due.

Excursions followed. These were for the display of the new equipage, for which Aurelia designed a loftier career than that of mere omnibus. These drives, limited in number and in length by the weight of the vehicle and the roughness of the country, made it necessary to furnish saddle-horses for those who could find no place in the coach. Two animals, therefore, were sent up from their farm-work two or three miles down the valley, and when Aurelia referred to the party and its progress she was accustomed to use the word "caval-

cade." She probably had the word before she had the fact.

There were excursions on foot. These led them to other valleys by rough and stony foot-paths across rocky ridges, and over the vast glaciers, too, that the mountain sent down into the Chatelaine's own valley. On several of these expeditions it was Aurelia's desire that her friend, most robust and tireless of walkers, should be transported in a *chaise-à-porteurs*, a novel experience for the Chatelaine, but one that, having tried, she was quite willing to repeat. Aurelia herself, lest she impair the Chatelaine's distinction by a duplication of her conveyance, tramped along on foot as best she might. But she took good care that Bertha had a cavalier on each side, that she should require a good deal of attention, and that she received it—all this to the curious wonder of *Zeitgeist*. The Chatelaine fell into this new pose quite easily; it did not seem very difficult for her to lean back among her cushions and to nod and beckon and command. Merit must make its demands; humility received no recompense; a firm and high audacity not only obtained its dues, but in doing so set a higher standard for dues more exacting still. So one of her attendants would be despatched for milk to some chalet more or less inaccessible, another would be hurried forward a quarter of a mile to figure out the probabilities of some obscure path, and a third would be bound down to an exacting study of the relative positions of chair, sun, and parasol. Even Aurelia herself did not abstain from various little offices: the chief priestess, having niched the idol and drawn aside the curtain, was only too glad to rush out and lead the worship by her own prostrations. To the very last it never occurred to this zealot to ask herself if her fellow-worshippers were really devotees, or, being such, to what high pitch their adoration might be pushed before zeal drooped to lassitude. She did not clearly bear in mind that *Fin-de-Siècle* was a skeptic rather than a devotee, and that but little was needed to turn the skeptic into a scoffer; she did not perceive that *Zeitgeist* was no worshiper, but a cold, aloof-standing scholar and critic; she did not feel that Tempo-Rubato, while a possible worshiper, yet preferred to select his saint for himself and to follow his own rubric. So she went on, stifling her little band with the fumes of incense, deafening it with the clangor of bells, and driving the half-hearted converts to apostasy by the maddening monotone of her ritual of praise.

Presently came the first signs of relapse; the young men began to question one another. Where, asked *Fin-de-Siècle*, was that naïveté so grateful to the jaded man of the world

(he meant himself), the only thing capable of soothing his wearied spirit? What, asked Zeitgeist, had become of the sturdy helpfulness which had no need to make a man into a lackey, and which no person of sense and capability could undervalue? Whither, asked Tempo-Rubato, had vanished that simple innocence which even the greatest reprobate among men admired and respected beyond the vastest store of knowledge that woman could amass? No answers came. Zeitgeist (the others too) inveighed bitterly, as more than once before, against the tyranny of sex—an importation now establishing itself in his own world. Fin-de-Siècle declared that he had canceled his last chapters, and hardly knew whether he should write others to take their place: what was more discouraging than to discover a supposedly new and lovely type, to fix it, and then to find in an altered light or from a shifted point of view but a reëxpression of the old and the familiar? Things such as these, he moaned, drove the artist to despair. Tempo-Rubato sighed sincerely over this great and growing change, and when, on the occasion of their last reunion in the Chatelaine's drawing-room, he sang, in his own key,

Spirito gentil, nei sogni miei  
Brillasti un' di e ti perdei,

it was almost in the accents of elegy.

Yes, the time for passing on had come, and Aurelia, within a quarter of an hour after the ceasing of Tempo-Rubato's song, made her final *coup*. She advanced to the oriel and drew aside the curtain, and the same white moonlight that enveloped her flooded the town and the valley and touched the great dome of the mountain with a cold and ethereal pallor. She extended her hand toward those white and climbing slopes, and declared that a sprig of edelweiss brought thence by each of the three would please the castle's lady. And the Chatelaine, robed superbly in the creamy splendors of Milan, swept promptly into the moonlight, and with stately acquiescence in her friend's suggestion announced that she would highly prize such parting tokens of regard. There was an instant of silence—silence stabbed by surprise. Zeitgeist heard this almost incredulous and altogether indignant. He remembered that the Chatelaine had once plucked for herself a blossom from one of the lower of those slopes, nor had he forgotten the bruised knees and lacerated wrists that had resulted from his endeavors to gratify Miss West's propensity for inaccessible flora. Fin-de-Siècle started back almost appalled; they had made him ruin his

trousers, and now they asked him to lay down his life. Tempo-Rubato gave a faint sigh of impatient protest; in this craze to exact tribute what malign promptings always suggested a tribute that was floral? The Chatelaine repeated her declaration, and announced that she should wish them God-speed as they sallied forth in the morning.

At daylight there came the first, faint fall of snow. At ten her guests set out.

Fin-de-Siècle's tribute was the first to reach La Trinité. It came from Paris. The petals of his flower were of spun silver; its heart was a pearl. The velvet case inclosing it was of the color of the Chatelaine's new liveries.

Zeitgeist's offering came next—from the Vintschgau. He sent not a single spray, but a dozen, all carefully arranged, labeled, framed,—a tablet to his own energy and daring. The dozen flowers were from a dozen different places,—formidable peaks, dizzy passes,—but not one of them had been plucked within twenty miles of La Trinité.

Last of all came Tempo-Rubato's. He sent a painting, the work of his own hand. In the immediate foreground his edelweiss, the size of life, blossomed on the corner of a rocky and inaccessible ledge. The background presented in a marvelously small space a wide desolation of jagged peak and dazzling snow-field. In the middle distance a single figure—The Tempo-Rubato of the Lucerne steamer—appeared at a sudden rocky angle, but whether in advance or in retreat it was difficult to say. A wide, impassable chasm separated him from the flower, but across it he seemed to flash a mocking smile of adieu.

LAST summer a wayfarer descended from the glacial fields above La Trinité, and trudged downward through the valley. Some four or five miles below the château he passed a group of clever-looking young men who were occupied with a three-legged instrument constructed of brass and mahogany, and who had left a trail of stakes behind them. Farther on he passed a group of laborers busy on an embankment that had come to dispute the passage with the brawling stream. A mile lower the gaunt form of a great iron truss spanned the river, and from beyond the jutting crag that closed the view came the muffled shriek of a steam-whistle. He went no farther.

In retracing his steps through La Trinité, he paused at the inn, and, looking up at the château, inquired after its mistress. She had left the valley. The Chatelaine—her way prepared, her path made straight—was now in Paris.

## MONEY IN PRACTICAL POLITICS.

PERHAPS no field offers a better opportunity for the study of human nature than that of practical politics. No man better understands the motives that guide men in daily life than the politician; and no man uses

this knowledge to accomplish his own purposes with greater skill than he.

By the ordinary citizen of the educated class, the practical politician is thought to be a man who, though sometimes perhaps having good intentions, is nevertheless led by selfish motives, in the main, to do selfish, corrupt, and dishonest deeds. In his own eyes, the practical politician of the higher grade is a patriotic citizen working for the good of a party upon the success of which depends the welfare of the country. He feels in many cases that he is driven to acts which to him are unpleasant; which are, perhaps, on the whole unfortunate for the country, but which, under the circumstances, are still a stern necessity. To be sure, among the "workers" will be found many who care neither for country nor party, nor even for leader, though that is rare; but in the higher ranks the proportion of the consciously dishonest, although possibly larger than that of the same class among merchants or lawyers, is still small. Most of our office-holders in the higher legislative and executive positions are at bottom as honest, hard-working, and self-sacrificing as men of other classes. The "submerged tenth" have dragged the reputations of their fellow-politicians lower than truth would permit us to declare their characters to be. These differences of opinion with reference to the character of the practical politician come largely from lack of knowledge on the part of the public as to the circumstances in which the politician is placed, and as to the pressure that is brought to bear upon him, as well as from ignorance of the amount of excellent self-sacrificing work that he really does.

Our Government is said to be one founded upon public influence guided by public opinion. There can be little question that all reforms must come from demands of the public; but unless the people are well informed as to the exact condition of affairs, they cannot act with intelligence. At the present time there is a great outcry against corruption in elections, and the selfish acts of the practical politicians as shown therein, and a demand that these

abuses be done away with. The demand is most certainly a worthy one; but it comes in good part from men who, though honest and well intentioned, do not begin to appreciate the real state of affairs, and who, consequently, too often suggest remedies for the abuses that are utterly impracticable, and which in many cases would do more harm than good. When the people really see things as they are, know what ought to be done, and demand that action be taken, the politician will be ready and prompt to act. The politician cannot act until he feels that public opinion is with him; his business, in fact, and in justice too in the main, is not to guide public opinion, but to follow it. He may help to create and guide public opinion, but that duty is equally incumbent upon lawyers, preachers, teachers, and all good and intelligent citizens. We need to distinguish in this regard the reformer, and even the statesman, from the politician. It is the business of the politician, and the business is a worthy one, to care for the interests of his party, and thereby, as it appears to him, for the interests of the state; and his party interests cannot be cared for unless he follows public opinion. To the politician also "the public" means, not merely the educated or the good citizens, but all citizens who have votes. If, then, we expect the politician to change his methods of action, we must in some way bring it about that by the change more votes will be gained to the party in power than will be lost.

A politician knows very well that he does many things that are condemned by the most enlightened consciences; he does many things that to himself are disagreeable, and that trouble even his well-trained conscience; but, as has been said, to him these acts are necessary, and he does them as other good people do necessary but unpleasant tasks. When he can be made to see that it will be better, not for himself personally, but for the success of the party,—which, let me repeat, to him means the good of the country,—to change the methods of conducting elections, nobody will be more ready to change than he. Indeed, as vote-buying is in reality a very unpleasant business for many of our most influential politicians,—so much so that many of them, while directing it, will never themselves take any part in it,—no one will work more actively to make this practice unnecessary than will they, if it can be clearly shown that a change to a better system of carrying elections is practicable.

Now nothing can be done that will have more influence in bringing together the opinions of the practical politicians, and of the citizens who are not in politics, than a candid statement of the real conditions under which elections are carried. The objectors to the present methods of work will then see the circumstances under which the politician acts, will be better able to see some remedy that can be suggested for the present state of things, and thus will be enabled to help the politician into better methods of political work.

#### PARTY ORGANIZATION.

PERHAPS the most important duty of the politician, under our present system, is to make nominations; but passing that by, and assuming that the nominations have already been made, let us see how the politician goes to work to carry an election. The first essential condition to success in a campaign is thorough party organization. We often use the word organization without fully realizing what thorough organization means. The "blocks-of-five" letter that was so much denounced in the campaign of 1888, while bad enough in intent from the standpoint of an honest citizen, was, nevertheless, in many respects, a very sensible, wise letter from the standpoint of practical working methods. From the standpoint of a "worker," the main objection to it was that it was entirely unnecessary to take so much risk as the writing of the letter involved. Probably in the whole State of Indiana there were few places where the organization was not as complete as that recommended in the famous letter.

As I write, I have before me some pages from the poll-books and check-books of one of the county committees in the State of New York. Before registration day a thorough canvass is made of each election district. The names of all of the voters are arranged in these poll-books alphabetically. After the column of names comes a series of columns headed, respectively, Republican, Democrat, Prohibition, Doubtful, Post-office Address, Occupation, and Remarks. Each voter's address is taken, and opposite his name is placed a mark in the proper column showing whether he is a regular Republican, a Democrat, or a Prohibition voter, or whether he is to be considered a "doubtful." After registration day, each man who registers has his name checked in the poll-book, so that the committees of both parties have a complete list of all those entitled to vote in each district. From this book, then, a check-book is prepared. In this second book, if I take as an example the check-book of the Republican party, on each page will be arranged in the first place, alphabetically, the names of

all the Republicans in the district; then in a column below, or on another page, all those that are considered doubtful; that is, those whose politics are not known, and those whose votes it is thought possible to bring to the Republican party either by persuasion or by purchase. The Democratic committees have books similarly arranged, with the names of all the sound Democrats and of the "doubtfuls."

In some places the prices that are paid from year to year are entered, usually, perhaps, as in the case of an acquaintance of mine in Michigan, by a private mark. Such entries depend upon the care and skill of the individual "worker." They are not very common, and really seem unnecessary. The memories of the "workers" will serve as long as it is necessary; and they do not care to keep historical records, interesting and valuable as such records would be.

On election day, then, it is an easy matter for the poll-book holder, standing by the polls, to check the name of every reliable party man as he comes to vote, and near the end of the day to find out how many men of his own party have not yet voted. He can then readily send a messenger to bring in any late or careless voters, the character of whose votes is not doubtful. The workers of each party, having thus a complete list of all doubtful or purchasable voters, will know how to handle them.

These doubtful voters will not be divided carelessly into "blocks-of-five and each block put into the hands of a trusty man," but each doubtful voter, being known, with his habits, his work, his associates, is considered individually. If he is one whose vote can be affected by honest persuasion, the man in the party who would be likely to have the most influence with him is selected to work with him, and to influence his vote by fair means, if possible. If he is a man whose vote must be purchased, he will be assigned to the worker who can purchase him to the best advantage. If the number of "floaters," or "commercials," as they are variously called, is relatively large to the number of workers, it may well be that they will have to be purchased in blocks of fives or blocks of tens; or, again, owing to social reasons, they at times can best be bought in groups, or clubs, or traded; but in all cases where the best work is done, each individual "floater," whether bought singly or as one of a group, is looked after personally by the man best competent to handle him.

Sometimes, especially where vote-buying has not been very common, it requires much skill and tact to handle these "commercials" to the best advantage. Your "float" is at times a sensitive, proud creature, patriotic to a degree. He votes, forsooth, with his party, as an

honest man should. But if, perchance, he can be made to believe that his own party "workers" distrust him,—that his name, for example, has appeared on their check-books in the doubtful column,—his wrath is enkindled, and his political enemy gets his vote on easy terms. And, again, he often feels it right to desert his party's candidate, unless he is paid as much money as the opposition will give. On equal terms he will vote with his party; but surely his vote is worth as much to his candidate as to the other, and why should he not get some money as long as there seems to be plenty to spare? He needs it more than do the candidates who furnished it. As a rule, however, a "floater" gets less for voting with his own party than with the enemy; and the regular "floater" is not sensitive, but may be approached directly and bargained with.

#### CAMPAIGN FUNDS.

A NECESSARY preliminary to the work on election day is the securing of election funds. Of course, there are many legitimate expenses in an election; the printing of tickets in ordinary cases, the hiring of campaign speakers and the payment of their expenses, the rent of halls, the printing of campaign literature, the purchase of torches and uniforms for processions, if such be considered necessary, etc. But after all, in close campaigns in doubtful districts, by far the largest part of the funds goes for the direct or indirect purchase of voters. How are these funds raised? The facts that follow are not mere guesses. The information in all cases is thoroughly trustworthy, though I am not at liberty to give names, and in many places it would be unwise to mention localities exactly. But in all instances cited the statements are trustworthy.

Of course the first, and in most cases the chief, source of revenue is the assessment of candidates. The amount of these assessments varies in different localities and under different circumstances. A common assessment in Illinois, for example, in districts that are not considered especially doubtful in ordinary elections, is five per cent. of the annual salary; and it is expected that all candidates, unless there is some special reason for exception, will pay this assessment. However, it not infrequently happens that the most valuable candidate for the party is a poor man who is unable to pay the regular assessment. In that case, the committee, taking all the circumstances into account, ask him to pay what seems reasonable, or he may be even entirely exempted from assessment, as in the case of a crippled candidate for county recorder in Indiana in 1890. A wealthy candidate, who can well afford to pay more, is sometimes assessed a lump sum with-

out any especial reference to the salary that he is to receive if elected.

In national elections local county committees expect to receive money also from the national committee, usually through the hands of the state committee. In the campaign of 1888 the Republican committee in one county of Indiana received \$800 from the state committee, which they supposed, as a matter of course, came from the national committee.

In the campaign of 1880, in that same State, the two leading county managers of one of the parties went to Indianapolis and met there a representative from the national committee. They went to his room in the hotel to talk with him regarding funds. When he asked their needs, it was replied that they did not come to beg money from the national committee, but that their county stood ready to match dollar for dollar whatever sum he was willing to give them. "You're the kind of men I have been wanting to see," replied the gratified representative from New York. "You can have as much money as you want; help yourselves." He took down two valises, and threw them open, showing them packed full of bills. One of the most astute of New York political managers is of the opinion that while they doubtless took what they needed, they failed to keep their promise to match the sum "dollar for dollar" from their own county; but they did keep their word.

Another source of revenue, and one that is much larger than we should expect, if we did not consider the great enthusiasm that a close campaign arouses, is voluntary contributions. I am not speaking here of the large sums that are raised by national committees from wealthy men, especially from those who feel that they have much at stake in national legislation, but the amount that is contributed to county and city committees in local campaigns. In the campaign of 1888, in the same county that received \$800 from the national committee, one little city of 4000 inhabitants raised \$1200 a day or two before the election, after the assessments had been collected. The money was given voluntarily by enthusiastic men. In that campaign, in that county, some \$7000 was spent by one party alone, the greater part of it in the purchase of votes.

Not infrequently, however, some extra pressure is necessary to secure the proper amount from those assessed, or to increase the size of the voluntary contributions. In this same campaign of 1888, in the most important city of a doubtful congressional district in a Western State, the management of the city campaign was put into the hands of a young men's club. The candidate for congressman, of course, had to pay assessments to each one of the county

committees in his district, besides paying to the local committee in charge of the election in this city. He was a man who had himself been an active campaigner for many years, a man who was known to be unscrupulous in his methods, and one who was commonly believed, even by enthusiastic members of his own party, to have purchased his nomination at an expense of \$1500, mostly spent in packing caucuses, though some delegates were probably bought outright. The chairman of this young men's club was without much experience in politics, but, nevertheless had a good knowledge of political methods. He was a young man of strong will, a shrewd judge of human nature, and he knew his man. The executive committee of the club was called together at the proper time, and in allotting to the leading candidates the sums that seemed proper for them to pay, this candidate for Congress was put down for \$200. A messenger was sent to ask him to come to meet the executive committee. It was known that he was a hard man to collect money from, and the committee expected trouble. When he came in, the chairman said, "Well, Mr. —, I suppose you know why we have sent for you." The candidate replied, that he presumed they needed money, and added he expected, of course, to pay his share. "We have been considering the matter," said the chairman, "and we have decided that your share is \$400." The candidate, evidently surprised, inquired if the sum was not rather large, but was solemnly assured that, as the campaign was to be a severe one, they were unanimously of the opinion that he should pay \$400. After some hesitation, he said that he would do so, put his name to a subscription paper, and left the room. The committee were jubilant (as one member expressed it, "I thought I should tumble when he said \$400"), and thought the chairman's doubling of the amount agreed upon a stroke of genius; but he explained that he had thought it necessary to ask twice what was expected in order to get what they really needed. Inasmuch, however, as the candidate had promised the \$400, he intended to collect it. So, when the proper time came for asking for the first instalment, he sent a messenger for \$200. After some hesitation, and a somewhat more earnest demand, a check for \$200 came. When shortly before the election a messenger was sent for the second instalment of \$200, and the money was not promptly forthcoming, an emphatic demand was sent to the candidate, with the assurance that if the messenger did not bring back a check for \$200, the young men's club would drop the work of the campaign then and there; it was not their intention to carry on a losing campaign, and the money must be paid at once

or they would cease their work. The messenger brought back the second check for \$200.

In a county in Indiana the chairman of the Republican committee found, on the day before election, that he had at his disposal, raised by the usual means, some two or three thousand dollars. The Democrats had probably about the same amount. The county was a close one, and the Republican chairman felt that he needed more money; so he quietly sent word to the leading Republicans that he had learned, straight from the Democratic camp (with the intimation that he had bribed some of the Democratic committee to tell), that the Democrats had \$6000 ready, and that unless the Republicans could raise more money, the election would be lost. These wealthy leading Republicans were summoned to a meeting that evening. The case was laid before them; they were assured that the campaign was lost unless more money were raised, and there, on the spot, at least \$3000 were collected. The next day the Republicans were in a position to offer \$40 a vote at the opening of the polls. By ten o'clock the Democratic money was gone, and after that the Republicans could buy votes at their own price. About three o'clock, an eye-witness tells me that he saw the Republicans buy "a whole raft of voters" at the lowest rates; the Democratic money had been exhausted hours before.

This plan of offering high prices for votes early in the day by the party that has most money, and thus exhausting early the enemy's treasury, is common. A local leader in New York State told me that he once made the opposition in one town exhaust their funds in the purchase of their first ten votes, and that then he bought all day for one fifth the first sum offered.

Money comes to aid the candidates also in many other ways than in those mentioned. In the State election of 1891, one of the candidates for membership in the lower house of the Ohio legislature, a resident of one of the central counties, within a week of his nomination, was approached by the postmaster of his city and told that if he would agree to vote for Mr. — for United States Senator he might have all the money that he needed to bear his campaign expenses of all kinds, and that he might name the sum himself. Any candidate who is willing to sell himself can easily find money to help secure his election.

#### CAMPAIGN METHODS.

ALTHOUGH in many districts, especially where the proportion of the "commercial" voters is large, bribery is most relied upon to secure votes, other means are not neglected.

Anything that can carry demoralization into the enemy's camp is likely to be resorted to; though, in such cases, everything depends upon the personal character and shrewdness of the managers.

One of the most astute, as well as one of the most unscrupulous, of political managers is Dr. C—. He is a man whose character in private business is entirely above reproach, a man of unusual intelligence, of good credit, and good morals. He has been the chairman of the Republican committee of his county for a number of years. Into his county there came some few years ago a lightning-rod agent, a southern man, and an ex-confederate. He was a violent Democrat, a shrewd talker, and soon won the confidence of the Democratic managers, and became prominent in their councils. But the lightning-rod business was not very profitable, and the man seemed to Dr. C— one whom he could use. So meeting him one day, he inquired about his business, found that it was not very good, and offered him an opportunity to make more money, and a good regular income if he wished. The man asked what he was to do.

"In the first place," said C—, "you are to obey orders; do exactly as I tell you; ask no questions, and make truthful reports. I want you now to go down to the town of J— and make the acquaintance of Mr. G—; hunt him up, and talk with him. I do not care what you say,—talk lightning-rod business,—but go and see him to-day and report to me, and then make it your business for the next few weeks to see him as often as once or twice a week, and talk with him, so that the neighbors will know that you two are acquainted."

A campaign was coming on, and Mr. G— was the most trusted Democratic "worker" in his town, and the man who had regularly handled the funds for his party there. The lightning-rod agent had himself appointed on the Democratic committee, and gave reliable information to the Republican chairman as to the amount of funds the Democrats had, what their plans were, and all other information that could benefit the Republicans.

Shortly before election day, acting under the instructions of Dr. C—, he began to hint to the Democratic managers that all was not right with Mr. G—. He doubted his loyalty to the Democratic party. He suspected that he was betraying the interests of the party to the Republicans, and that he would turn over the money given him to buy Republican votes. At first he was not believed at all. G— was an honest man, and had been a reliable Democrat for years; it was impossible that he should be treacherous. At length, one or two

evenings before the election, in a meeting of the Democratic committee, this agent declared that he knew Mr. G— was playing false; that he had overheard Dr. C— and others talking, and had learned that they had purchased Mr. G—. When this was still not believed, he told the committee to name any man from their number to go with him; he had heard that a meeting of the Republican committee was to be held that evening; he knew where he could listen at their door without fear of detection, and he could get absolute proof.

A man, one of his own kind, was selected to go with him. They went to the building where the Republican headquarters were, and secreted themselves so that they could overhear what was going on within. Soon Dr. C—, Judge A—, Messrs. H—, and D—, and other members of the Republican executive committee, began talking over campaign matters in the town of J—. Dr. C— brought up this case of Mr. G— (of course, this had been arranged by him with the spy beforehand), and told the other members of the committee, in detail, how he had purchased G—, how much it had cost him, how much money he was to get from him, the exact sum that the Democrats had put into his hands, etc. The agent and his ally then crept back to the Democratic headquarters and told their story.

The Democrats sent a messenger post haste to summon G— to come at once, that night. He appeared before the committee, and was denounced for his treachery. He denied the charge vehemently, called to witness his long service to the party, his character, his habits, everything—but to no avail. There were two witnesses present who had heard the whole details of the story from Dr. C—. He was read out of his position of trust in the party; but it was too late to get another man to fill his place in that town. His friends and neighbors trusted him, and disbelieved all the charges made by the Democratic committee, so far as they were known. The consequence was that the Democratic management in that town was utterly demoralized, and the Republicans easily carried the day.

Dr. C— kept his lightning-rod agent in his employ for two or three years, using him at his will as a spy upon the Democratic camp. He had suspected one year that one of his local managers was playing false to him, but he had no proof. Shortly before the next election, his agent spy was instructed to make the acquaintance of the man, and to attempt to buy him for the Democrats. This was done, the bargain made in detail. Then Dr. C— sent his agent to the Democratic manager, who, he suspected, had made the bargain the year before. In confidential tones the agent told his brother Demo-

crat that he had found a traitor among the Republicans, his influence, his price, etc., and at length his name. "Sh—," said the manager, lifting his finger. "Keep away from him; he's my man. I got him last year." A little questioning brought out all the facts, which were duly reported to Dr. C—. He, in turn, called on his Republican co-laborer of the year before, and, by his knowledge of facts, forced from him a humiliating, in fact, tearful confession, and a restitution of the money. Finally, when it was evident that the lightning-rod agent could be used no longer, the doctor told him that he thought he had better leave the county; that he should go to the Democratic manager and get a suit of clothes for the services that he could render the Democrats in that campaign. He went, and received a suit. On election day he appeared in his new suit of clothes; and taking the Republican ticket in his hand, made a speech to the Democrats, announced his conversion to Republican principles, voted the Republican ticket, and left the polls and the county, never to return. Some time after, the Democratic manager, Mr. A—, a thoroughly upright, trustworthy, honorable man in all matters not connected with political campaigns, meeting Dr. C—, remarked, after referring to the lightning-rod agent, "Dr. C—, I believe you are the — villain that ever lived"; a remark which Dr. C— took, quietly smiling, without comment. Of course the news of the agent's treachery gave rise to the belief that in some way Mr. G— had been betrayed; but the details of the plot were known only to the agent and Dr. C—, and Dr. C— has, presumably, never told the story to any except reliable, intimate Republican friends.

I know of an instance in Michigan where a very skilful Republican ward "worker" has kept a Democrat in his pay for years. Through him he is kept informed of the enemy's plans; helps pack the Democratic caucuses to Republican advantage—an excellent trick, he thinks; buys votes to better effect, etc. Doubtless such instances are not very common.

To demoralize the Democrats, in one congressional district in a Western State, in 1888, the Republican candidate paid a man \$600 and expenses, some \$1500 in all, to run as a Labor candidate, and thus draw part of the Democratic vote. After getting the money, the Labor candidate is said by the Republican managers to have sold out to the Democrats, though my information on that point is not entirely trustworthy.

#### HOW VOTES ARE BOUGHT.

AND now, how are the voters bought? I have shown how thoroughly each district is organ-

ized, how carefully each vote is watched, and some few of the many plans adopted to weaken the enemy. In many cases voters who can be bought beforehand are kept in custody for a day or two before election, then taken to the polls, and voted. In one case, in Indiana, a man kept a half-idiot who was working for him shut up in his cellar for some days before an election, to prevent the opposing party from capturing and treating him in the same way. Then, on election morning, with a man on each side to guard him, he was marched to the polls with a prepared ticket in his hands, and voted.

In 1888, in another county of the same State, six "floaters" were kept under guard in an upstairs office over night, the next morning taken down, marched to the polls under guard, voted, brought back to the office, and \$96 paid to their leader—\$16 apiece. How the money was divided among them only the leader knew. The owner of the office is an intelligent, honest, patriotic, Christian citizen, who detests the whole system, but who says that he cannot sit still and see the enemy win by such methods. He favors any law that will stop the custom in both parties, even though it should be to the disadvantage of his own.

In a small city in Michigan a friend of mine saw two "floaters" go back and forth across the street several times between a Republican and a Democratic worker. The first bid was a dollar, and the bids were increased a dollar at a time. The men finally voted at \$7. In one of the eastern counties of New York, some years ago, a good church deacon and his son received \$40 each for their votes from a manager of their own party to keep them from deserting to the enemy. That year, in that district, a strongly Republican one for many years, the Democrats nominated a very wealthy man for Congress with the hope of winning. The management of the election was put into the hands of a man who, up to that date, had been an active Republican; but his services had not been rewarded. The Democratic candidate is said to have spent \$190,000. This seems beyond belief; but it is certain that the Democrats won, that the campaign is still remembered for its unheard-of extravagance in vote-buying, and that the corrupting influence of that campaign of some years ago is still felt in the district.

In another Western State, the night before election, the Democrats had several "floaters" corralled in a small hotel and plentifully supplied with whisky. During the night the building was set on fire; and as the "floaters" escaped from the flames, most of them were captured by Republican "workers," run in for the night, and voted as Republicans the next day. Two theories as to the origin of the fire

have been offered: one that the stove was upset by the drunken "floaters"; the other, that the building was set on fire by the Republican workers.

In one of the eastern counties of New York State, Mr. L——, a local Democratic politician, had a bull for sale. The day before the election of 1888 a farmer came to buy the bull. The price asked was \$20, the amount offered was \$15; no sale was made. The next day L—— was at the polls looking out for votes. The farmer, with his two sons, all of whom commonly voted the Democratic ticket, inquired how much he was paying for votes. He told him \$5 apiece. The man went away to see the Republican "workers," and soon returned, saying that he had been offered \$6 each, making \$18 in all. L—— considered a moment, and then said: "Well, you take these three ballots and go and vote them, and tomorrow come and get the bull." "So," as my informant tells me, "the honest farmer and his two sons took the ballots, and went, and voted for the bull." L—— transferred \$20 from the election pocket to his private pocket, and the double transaction was complete.

In Albany County, New York, a number of years ago, one of the Republican candidates prepared some tickets to be given to the "floaters" who were purchased for him. On the presentation of these tickets, they were to receive the sum stipulated. Some of the Democratic committee learned of the plan, secured one of the tickets, and then forged enough for their own use. During the day they bought voters freely for their own party, and paid them in tickets which were sent to the Republican candidate to cash. He redeemed tickets all day, and toward the close of the polls, counting up his tickets, and believing himself elected by a large majority, offered to bet a round sum as to the size of his majority. When the polls were closed, however, and the votes were counted, he was found to be defeated, his tickets having been used to too good advantage by the Democrats. In many localities little money goes directly to the voters. It is paid to men of influence to use in treating, etc., or simply to get them to coerce laborers or to influence friends.

These instances that I have given are typical, although in certain respects they may be considered extreme, and in these forms are, perhaps, not very common.

#### HOW PREVALENT IS VOTE-BUYING?

AFTER all, the vital question is, How prevalent is this custom of cheating and of purchasing votes, and what possibility is there of reform? The prevalence of the custom of vote-

buying depends, of course, very largely upon the locality, and upon the circumstances in each case. Where a district is strongly Republican or Democratic, and there is little likelihood of defeat for the more prominent party, there is little necessity for vote-buying, and little is done. In a city of some 15,000 inhabitants in the State of Illinois in the campaign of 1888, money for the direct purchase of votes was furnished to only two wards, and \$125 only was put into the worst ward—*i. e.*, the one having the most purchasable votes—by the party having the most money. In most of the wards three or four "workers" were paid for their day's labor at the polls, at \$2 apiece; and a few, mostly colored men, were hired to drive carriages to bring voters to the polls. In this way eight or ten votes, possibly, at each polling-place were made secure. But in one or two of the wards not even "workers" at the polls were paid for their time; all was voluntary. This paying of "workers" is almost universally found.

I have spoken of one county in another State in which, in that same campaign, \$7000 was spent by one party, mostly in vote-buying. In that county is one township, the most corrupt that my attention has ever been called to. I have been assured by thoroughly trustworthy informants from both parties, members of the county committees, that in that township of some two hundred voters there is not one thoroughly incorruptible vote. The Democratic managers have not one vote of which they are entirely sure; and while there are some Republicans who cannot be bribed by the Democrats, there is not a single Republican voter in the township who does not demand pay for his time on voting day. Under the new ballot law of Indiana, each county campaign committee has to select for each precinct an election judge and an election clerk, residents of the precinct. In 1890 the Democratic committee had no men in that township whom they could thoroughly trust to fill these offices. They feared that any whom they could appoint would be bought by the Republicans. However, they made the best selections that they could; but on election day, in the afternoon, the feeling of distrust was so great that the candidate for district judge drove some miles in order to be on the ground, and by his presence bring what pressure he could to bear upon the Democratic election judge and election clerk.

A man who knows assures me that there is one township in eastern New York, containing about four hundred voters, in which not more than thirty voters are entirely beyond reach of the money influence. Of course these are extreme cases; but it is nevertheless true that the proportion of voters who are subject to

money influence is very great. I have had estimates given me many times by men whose knowledge is based upon experience, and I find that the localities are not very uncommon where from ten to thirty-five per cent. of the voters are purchasable. In one county in New York, in which, perhaps, the Mugwump vote is larger in proportion to the total vote than in any other county in the State, and in which the largest city has only some 12,000 inhabitants, about twenty per cent. of the voters were purchased in 1888. Perhaps I need not add that the voters purchased included none of those counted as Mugwumps.

In Michigan, in one of the best and wealthiest wards of a city of some 15,000 inhabitants, the ward manager tells me that he pays about five per cent. of the voters. His price has never gone above five dollars, and he usually pays only one or two dollars. Though he has to pay some voters of his own party, he never gives them more than two or three dollars, and usually only one dollar.

The evil is not confined to the cities, nor to any one State. The probability is, that, all things considered, in such a State as that of New York, the farmers are as corrupt as the residents of the cities. It is said to be not an uncommon thing in New York State for a farmer to drive in to the polls with his sons and hired help, and virtually auction off the lot to the highest bidder. In California, an eye-witness tells me that he has seen fifty votes offered in a lump by one leader, though, in the special case mentioned, little was at stake in the election; no bidders were found, and the men (Greasers) finally withdrew late in the afternoon without voting at all.

#### THE EFFECT OF VOTE-BUYING ON THE VOTERS.

PERHAPS the chief danger to the State from this corruption is that where vote-buying has become common, the habit has so permeated the lower class of voters that the thought of corruption or of wrong-doing does not enter the minds of many. They feel that they have something to sell which is valuable to the candidate; and they sell their vote to the candidate with almost as little sense of guilt as they sell their potatoes to the grocer or their labor to their employer.

In a small city in Michigan, in a single election for alderman, caused by the resignation of the former holder of the office, in the wealthiest and most respectable ward in the city, a friend of mine was a candidate. On the day of election an acquaintance came to him, said that he wanted to vote for him, and asked him for a dollar or two. The candidate referred him to a committeeman who, he said, was managing the

campaign. The day after election even, a man came to him and asked him for two dollars, saying that he had bought two votes for him the day before for a dollar each without instructions, and he would like to have the money refunded. He, too, was referred to the committeeman, though he was doubtless lying with reference to the purchase of votes. In these cases, the men evidently had little feeling of guilt for vote-selling, and this seems to be the general testimony regarding the lower class of "floaters."

#### CAUSES OF CORRUPTION.

BEFORE we can find remedies for the corruption of the ballot it will be necessary to look somewhat carefully into the causes of the corruption. It is not sufficient to say that the corruption is due to the party spirit of the time, or to our form of ballot, or to any other one or more of such external causes; the causes lie deeper than that. In the first place, so long as we have, practically, universal suffrage, we shall always find many voters who are ready to cast their votes not from principle, but for their own pecuniary interest, though this number is smaller than many think. A large part of the "commercial" are paid to vote as they would vote without bribery. Not till the millennium comes can we expect these most selfish voters to refuse to sell their votes, if the opportunity offers. We must in some way make it for the interests of the party managers not to attempt to buy. But, on the other hand, whenever an election is close, and "floaters" stand about, waiting for bids, the temptation is so great for party managers to buy, in order to secure the election of their candidates, that we need not expect the practice to stop, unless in some way, as said above, we can make the advantage to be gained from honesty greater than that to be gained from dishonesty. At the present time, under our present laws, the prize is so great and the risk so slight, that corruption is sure to be found in almost every close district.

At the present time, many a man who will not sell his vote to the opposite party will nevertheless ask pay for his time on election day. From this receipt of his expenses in bringing himself and his workmen to the polls, bribery is made easy. The man feels that he is not selling his vote; he was expecting to vote his party ticket at any rate. But after he has gone thus far a number of times he loses sight of the real purpose for which he is voting, and the ballot seems to be cast for the good, not of the country, but of the candidate. If the candidate is to be benefited, why should he not pay for the benefit? He can afford it. Not a few men, seeing money going freely into the pockets of "floaters," say to the managers: "If

money is so plentiful, why should the scoundrels get it all? Let us honest partymen have our share. Our votes are worth just as much to the candidates."

In classes of university students, containing from ten to twenty voters, more than once I have found several,—from five to ten,—who had received from campaign managers their expenses home from college to cast their votes. These students were by no means common "floaters"; their votes could not be directly purchased at all. But still, on first consideration, many of them defend the payment of expenses of voters by their own party, when they are unable to pay them themselves, not realizing that this is but a covert form of bribery, and that, after receiving expenses, one would not feel at liberty to vote independently. If people as intelligent and honest as are college students of voting age will thus thoughtlessly encourage corrupt methods of voting, what may we expect from the "floater"?

Another cause that has conduced to the corruption of voters is the lack of distinct issues between the parties. When party feeling is very strong, as in our country at the time of the Civil War, when most of the masses feel that upon the success of their party depends the existence of their country, votes will not be so readily sold; relatively speaking, only here and there will be found a man whose vote is purchasable. But when the issues between the parties are not sharply drawn, when a man feels that either party's success is of slight consequence, it is much easier to secure his vote by purchase without any consciousness on his part of corruption.

Without going deeply enough to see the principle that underlies the practice, party managers not infrequently declare that the independent voter in good part is responsible for bribery. It is said that when party lines are sharply drawn the voter will not betray his party, but that when, through the action of independent voters, independent voting has become not merely respectable, but on the whole a mark of the educated, intelligent class, why should not the ignorant voter feel free and proud to cut loose from his party and vote as he will? It is a mark of spirit and intelligence. The intelligent voter, the Mugwump, votes from principle; the ignorant "float" votes for his own advantage, being often too ignorant to distinguish the difference. The argument is used to discourage independent voting. There is some force, doubtless, in the ingenious plea for party fealty, but the real causes of independent voting are of course overlooked in such an argument, and the remedy is to be found rather in making distinct issues than in voting with one party always. The party managers that cover

up and dodge the issues of a campaign are to blame rather than the Mugwump.

#### REMEDIES.

A LARGE proportion of four States have introduced ballot-reform laws to secure the secrecy of the ballot, and thus, as it is thought, to do away with vote-buying; but it will be found that the remedy, while helpful, is not sufficient. In the State of New York, in the last election, under the new ballot law, which, while not perfect, still secures the secrecy of the ballot, vote-buying was open and unbribed in some places, though it was far less common, on the whole, than before the law was passed. In one precinct of one of the cities of the State, in the election of 1891, vote-buying was so common that, counting the expenses of both parties, an amount equal to six dollars for every registered voter was paid. The managers, too, had a surplus on hand after the election.

The ballot law did part of its work well. The voter who wished to cast an independent ballot, but who, under the former law would have been intimidated, under the present law entered the booth, prepared his ballot in secret, and voted as he wished. So, too, the man who wished to be known as a party man, but who still wished to split his ticket, being compelled to prepare his ballot in secret, voted more independently.

But the "commercial" voter and the ward "boss" will still at times evade the law. Many a man who will sell his vote, not fully appreciating the enormity of the offense, is still honest enough to vote as he has agreed to vote, especially when he is paid by the party that he calls his own. Party managers know their men, and in many cases can, with a reasonable assurance of success, buy a vote and trust that it will be cast as agreed upon; but when party managers on both sides stand ready to buy, the law will not always be enforced. In some places in New York, in the State election of 1891, men pleaded physical disability on account of headache or other trifling imaginary ailments, and in that way obtained permission to take with them into the booth to prepare their ballots their "friend"—the vote-buyer of the ward. As soon as the managers on one side saw that the others were evading the law, it was much easier and more natural for them to evade the law also, than to attempt to get their rights after the election was lost, by long and doubtful appeal to the courts. So it came about, in some places, that at times two and three men entered the booth together, little attempt being made to enforce the law where any one wished to evade it; and vote-buying was almost as common as of old. It was not the

form of the ballot or the paster ballot that brought about these results; with the blanket ballot the same thing might have happened. It is the corruption system as a whole that has not only stultified the consciences of the buyers and the bought, but has hoodwinked and discouraged citizens who for love of country ought to have seen that the law was enforced. The patriotism of men who stand idly by and see such fraudulent practices may well be questioned. The man who shields a thief or a burglar is a criminal, and may be prosecuted for compounding the felony. How is he different morally from the man who winks at corruption of the ballot? Is not that a dangerous crime against the state?

I was discussing lately the merits of the new ballot law of Michigan, before the first election in that State under the law, with a ward "worker," a good, shrewd business man, who is in politics, not for money or office, but for the excitement and love of the game. He is a sporting man by nature. He has managed his ward for years with great success. The thought of honestly obeying the new law did not seem to enter his mind. His only talk was of methods of evading it. When at length I suggested that it might pay to obey it, and to insist upon the opposite party doing the same, he declared that they could not be trusted; that under an honest election they would have the advantage, for he could outwit them in vote-buying; and then, he feared, pathetically, that these new laws were going to take half the fun and excitement out of politics anyway, and he would prevent their action as long as he could.

A registration law that prevents the importation of voters is good. A ballot law that gives the timid party man an opportunity to vote in secret as he will, and that prevents intimidation, is also good, but we need still something more.

The politicians are sometimes averse to vote-buying, and at times will themselves stop it. In one township in Indiana, in 1886, the leaders of both parties, who had fought one another for years, who knew one another's methods, and how best to check them, agreed to do no vote-buying. Unable to trust one another, they met the night before election, and were paired off for work at the polls on election day; no man in either party who had been accustomed to vote-buying was permitted to speak to a "floater" during the day; no man was left a moment alone, unaccompanied by a watcher from the other party. Vote-buying in that town for that day was suppressed, only one vote on either side having been secured by unfair means. But instances of this kind are exceedingly rare, and in the present condition of public opinion cannot be counted upon. And yet, could not five prominent men

in each party practically compel such action in any rural county or in any small city, if they had the will and courage to make a stand? Each of them would need to be as ready to prosecute men in his own party as in that of his opponents. But of course such men are rarely found.

How difficult it is, though, for the average politician to forego a possible advantage for the sake of honest principles was shown not long ago in a city election in the State of New York. The committees had agreed to use no money on either side, and had instructed the ward "workers" to that effect. When, however, later in the day, the "commercials," who were hanging around waiting for a possible purchase, became plentiful, the temptation became too great for one "worker." He had agreed to use no money, but whisky had not been specified; so he supplied himself with a number of bottles of that, and began to run the voters in. Of course the opposite party soon discovered the trick, complaint was made, and the illicit traffic stopped; but the breaking of faith that day has since prevented so honorable an agreement.

This seems allied to another case in Michigan, where the candidate, knowing that he could not directly buy some of his opponent's voters, supplied an ally with money to treat them so freely that they became dead drunk and unable to vote at all; thus, as he said to me, "killing them off for the day." One of them might well have been killed for a longer period; for, as the candidate went home, he saw one of his victims lying in the snow and slush beside the gutter, on a cold, raw day, when such an experience could hardly result in less than a severe illness.

The New York law providing for a sworn return of the amount of money expended by the candidate, though good, as it stands alone, is of course of little influence; for the candidates pay large sums to campaign committees that are irresponsible. Even this law has been evaded in many instances, and party managers say that a majority of candidates in some places have perjured themselves in making their returns. It has doubtless, however, had some good influence, and more legislation along this line would be productive of still greater benefit. It seems very desirable that a law of this kind should be comprehensive, and so explicit in its provisions that a violation could be readily detected. There can be no doubt that before the passage of the Corrupt Practices Acts in England bribery was as great an evil there as it has ever been here, and that the methods of evading the first laws were as ingenious and technical as any used here to steal a senate or to capture a presidency. All the halls in a town

were hired to prevent meetings; to avoid bribery, rooms were rented for a week or two for guests that were never to come; men were hired by the dozen at enormous wages to erect campaign polls, and other squads of "floaters" were hired at equally munificent rates to guard them; that is, to remain in the nearest public house, and to look toward them a few times a day. Wives of needed voters were hired to make banners and uniforms, and their children to carry torches. Probably no imaginable method of corruption was overlooked. And yet their law is said to have practically ended the corruption, only here and there a vote being purchased now.

The English parliamentary elections are much simpler than ours, as only the one office is to be filled, so that their law would need much modification for adoption here. It may be, too, that some of its features would not be well adapted to our country, either because poorly suited to our people, or because we could not hope to secure their enactment. A law might be passed, however, were there a strong desire for reform, that might do much good. The following provisions are suggested:

Let the amount that can be expended for each candidate on the ticket be strictly limited; a certain small sum for a ward or town office, a larger sum for a county office, and a still larger for a congressional or State office, etc. The amounts should be liberal for all legitimate needs, and might be graded more or less by the number of voters, the size of the district, etc. Each candidate should be permitted to pay only his own personal expenses, for traveling, postage, etc. These sums should be limited, and he should be compelled to account under oath for every cent so expended. The rest of his contribution should go to his committee or manager. Every candidate representing a party should be compelled to have his campaign managed by his party committee. All the regular expenditures, except the personal ones mentioned above, should be made by the treasurer of the committee, and he should make a sworn, itemized return of every penny that comes into his hands. An independent candidate should select a manager who, under like conditions of accountability, should manage his canvass. The number of workers under pay at the polls on election day should be strictly limited, and the amount of their compensation prescribed. The English law does not permit the agents at the polls to vote. If their number is limited, however, I do not see the necessity for disfranchisement. Of course all bribery, promises of offices, etc., treating, and all such practices, should be forbidden, as well as expenditures for certain purposes that, though innocent, are really unnecessary, and which are

readily used to avoid bribery laws. Opinions might differ as to the nature of the expenditures to be forbidden; but whenever a practice, innocent in itself, becomes a cover for crime, expenditure of campaign money for it should be forbidden. Under this head in England come expenditures for torch-light processions and parades, bands of music, payment for carriages or horses to bring voters to the polls, payment of railway fares, expenditures for flags, cockades, ribbons, or other marks of distinction, etc. Some of these methods of conducting a campaign may arouse enthusiasm; but they can hardly be said to be educative, and politicians say that processions, music, even campaign speeches, affect few votes. If one party has them, the other must; but excepting the speeches, all might be forbidden with no harm to the voter, though I question if we have in the country a legislature bold enough to pass such a bill.

Many people defend the practice of bringing voters to the polls in carriages at the expense of the party, paying railway fares of those temporarily absent from home, etc. It is said that many a cripple, or poor man living at a distance, would otherwise be deprived of his vote; that the students in colleges, traveling salesmen, and others could often not afford to come home at election time, and that they would thus be disfranchised. So far as the matter concerns the crippled and infirm, while hired carriages do bring them to the polls, the carriages are not hired especially on their account, but rather for the sake of the owners and drivers, and that of the lazy and careless voters, whose votes are worse than useless to the country. The infirm, were no carriages hired by the committees, would hire carriages for themselves or be brought by public-spirited friends. As for the other classes, the trouble of bringing themselves to the polls would make their ballot of more value than it now is, and would make the right more highly appreciated. If they are to be aided at all,—a practice that seems to me undesirable,—it should be at the public expense, not at that of the candidate. No thoughtful, honest voter casts his vote as a favor to any man or party; he votes for his country's good.

This practice of paying for such expenditures has led very many of our farmers to feel that they should receive pay for their time, and that of their men, on election day, and has led college students to feel that they may honorably receive their expenses home. Why? They feel that they are voting for the good of the candidate. Why should he not pay them their necessary expenses? But no man can take such expenses, and thereafter cast an independent ballot. We ought not to blind

voters to the real significance of the ballot. I think it very doubtful if a law could be enacted here at present forbidding such expenditures; I have no doubt that, in connection with other laws, it would be desirable.

But to the provisions mentioned should be added the measure that has proved in England perhaps the most advantageous of all, the one recommended by Governor Hill in his annual message of 1890. By this law any successful candidate against whom can be proved a charge of bribery or of a corrupt practice, either on his own part or on that of his party managers, may be deprived of his seat by a writ of *quo warranto*, and his competitor, who brings the suit, may take the seat in his stead, unless the defendant shows that the petitioner also has been guilty of bribery, either through himself or his committee. This act, as a rule, makes it more advantageous, especially for the weaker candidate, to be honest than to be guilty of bribery; and, as experience in England and Canada has shown, self-interest in this way works better results than honest intentions merely. With this act it seems to me that we might be able to go further in accordance with the spirit of our institutions, and, in fact,—not merely in the statutes, as we sometimes do now,—disfranchise for a longer or shorter period any man found guilty of bribery or corrupt practice, either as giver or receiver. The fundamental principle upon which all democratic government is founded is that of personal responsibility. The true basis of suffrage is not property, or education, but personality. When one has lost this by failing to exercise his independent right to a vote, through yielding his principles to the will of another, he might well be deprived of his right to vote. Certainly a candidate for office, unseated because of bribery, should be disfranchised, as by the English law.

A system of proportional representatives, or a law providing that all nominations, whether first made in convention or not, must be made by petitions, and all candidates be given an equal chance of prominence on the ballots, would tend to weaken the influence of the "machine." Any law that tends to make the prizes for corruption less will be likely to have a good influence. But back of all these laws must be a favorable public opinion. At the present time in New York State, according to all appearances, no law would be more beneficial to the Democratic party than one that in reality established purity of elections. The Democratic managers concede that the Republicans have the advantage in vote-buying, because, as they say, "We have to buy not merely Republican votes, but our own as well." By far the larger portion of the purchasable vote is

probably normally Democratic. The Republicans, too, for several years, in the general opinion, have been able to raise money more easily than the Democrats. Men standing high in the councils of the Republican party have said to me that the greatest blow that the Republican party in New York had received for many years was the present ballot-reform law. And yet, with the legislature Democratic in both branches, and with a Democratic governor, no attempt has been made to extend the election laws in this direction, although Governor Hill recommended repeatedly—sincerely, his friends say; insincerely, say his enemies—such extension, along the lines of the best experience of Europe. What is the explanation of this neglect? The Democratic leaders say that public opinion is not with them. By public opinion, of course, they include the opinion of the "floaters" as well as of all of their own party managers. The leading Democrats, those high in the councils of the party, the leading machine politicians, would doubtless be glad to see the practice stopped, but the ward "heelers," those who have the money to handle, and who make good profits by handling the money, would be opposed to the stopping of the practice.

So, again, most of the "floaters" would be unwilling to see the practice stopped. The party managers cannot carry out the act unless public opinion is so strong in its favor that they can afford to alienate more than merely a large portion of the "floaters." They cannot afford to do it until the pressure of public opinion is strong enough to gain them by their act as many votes as they would lose by alienating the lower class of their party workers. County managers say that the men who handle their money regularly keep out good pay for themselves, twenty or thirty dollars at least, on election day, when much money is paid. It is the opinion of more than one that two thirds of these "buyers" could readily be bought for no great sum, being in party fealty little above the "floater" proper. I know of one in the West, who, in 1890, offered for \$200 to use his influence in his own party for the candidate for county clerk of the opposite party, the money to be paid on condition of the success of the candidate. It was feared that he was seeking to get evidence against the candidate, and no bargain was made.

In 1890, in Ohio, an expert workman in one of the rolling-mills in the interior of the State was hired by the candidate for Congress, a man since given a high executive office, to aid him in his campaign. He was first given \$400; then, for election day, \$1000 more. After election he had \$800 of it retained, on which capital he, within a few weeks, started a saloon. The head roller in the same establishment, a man earning from fifteen to twenty dollars a day, was

offered twice his wages for two weeks' work in electioneering for the same candidate, but he declined. These men, of course, were expected to influence the labor vote in the trades-unions, but the first one kept a large part of the money given him, and doubtless could have been bought by the opposition.

The opinion of many of our most intelligent classes is in favor of reform, though the measures of reform that they advocate may be sometimes unpractical, as the politicians charge; but there is as yet no popular demand on the part of the great mass of voters for this reform. Public opinion must be created, and here is the work for the reformers. We need the old Cobden cry, "Agitate, agitate, agitate!" Public interest, perhaps, can best be achieved by letting the people know through papers, periodicals, and books what is really done. This is by no means generally comprehended. And then, too, must be shown the evils that come from these practices.

So, again, as public opinion is slow to move, it may well be worth while to have the principles of rational, honest politics taught in our schools and colleges to a greater extent than is at present done. We hear much talk in school conventions of "teaching patriotism." But how is it to be taught? The practice of cheering the flag, of learning the biographies of some of our leading statesmen, or of learning to believe, without knowing why, that our country is the strongest and best on earth, will have little effect toward remedying our present political evils. Civil government is something

more than the written constitution, the names of the officers, the dates of election, and other such facts as are taught in our text-books on civil government. The civil government that will help our children to get ideas which later will be of practical use in politics is that which shows the principles of party government, the methods of making nominations, of carrying elections, of making appointments to offices, and all the other details of our political life as it in fact is managed, together with the facts of history and political science which show that, however valuable in carrying single elections, and advancing local interests, dishonest political scheming may be, in the long run the interests of states, as of individuals, are furthered by honest principles; that great public questions are not settled till they are settled right, because "the power in men that makes for righteousness" is, after all, when men's eyes are opened, the dominant one.

Lombroso, in his great work on criminals, has well said that each state has the criminals that it deserves. So, too, in a much truer sense, may it be said that each state has the laws, the institutions, the benefits, the evils that it deserves. Many of our best citizens, considered by themselves, are unjustly treated in our corrupt election practices; but taking our people as a whole, they have what they wish, though the wishing may be ignorant. When we, by the means suggested, have so enlightened our public that they demand improvements in these methods, the improvements will come, and that in a way to be effective.

*Jeremiah W. Jenks.*

## TOPICS OF THE TIME.

### Money in Elections.

THE preceding article by Professor J. W. Jenks, of Cornell University, on the corrupt uses of money in elections, is in many ways one of the most notable contributions yet made to the discussion of this important subject. It does not deal in generalities, but gives in specific form an amount of detailed information as to the ways in which money is used improperly which will startle persons who are not familiar with the mechanism of what is called "practical politics." Yet every one who is familiar with that mechanism must admit that all that Professor Jenks sets forth is true in every particular. The poll-books, which he describes as being used by the campaign committees throughout the rural districts of New York State for the purpose of keeping track of the purchasable voters, are very well known to all persons who interest themselves in politics at all. Indeed, the use of them has so hardened the consciences of the practical politicians that they make little or no concealment of their

contents. In some sections of the State the number of purchasable voters enrolled on these books is said to exceed the number of those belonging to either party.

What is true of New York is, in a greater or less degree, true of nearly every other State of the Union in which the strength of the two great parties is evenly balanced. In Rhode Island, for example, where money has been used corruptly in every election since the war, and in some before and during the war, there are known to be about 5000 purchasable voters in a total of 54,000, or nearly ten per cent. of the whole number. These are distributed over the State, ranging from ten in the smaller towns to 1000 in the cities; but in every case their names and individual prices are matters of record. In one town, according to a careful analysis of the record by the "Providence Journal," whose figures we are quoting, all but ten of the total registered voters were set down as purchasable. Prices range from \$2 to \$5 a head, according to the demand.

It is worse than useless for the American people to shut their eyes to the existence of this evil, or to ima-

gine that it will cure itself in time. It must be met in this country, as it has been met in England and other countries, with restrictive and prohibitive measures of the most comprehensive and stringent character. Bad as our condition is, Professor Jenks is quite correct in saying it is not so bad as that of England was before the enactment of its *Corrupt Practices Act* in 1883. Our bribery methods are in some respects different from what the English were, and are less open and less general, but they are all as easily reached by law as theirs were found to be.

In all American efforts to meet the evil by legislation the mistake has been made of trying to accomplish the end in a brief and more or less general statute. The authors of the various bills, while drawing their ideas mainly from the English act, have been afraid to imitate its great length and minuteness lest their measures be condemned as "too complex" and "too cumbersome" for the simple needs of free American election methods. When ballot reform was first discussed, the opponents of it raised the same cry against the bills which its advocates prepared, and sought to have substituted for them measures of their own invention which were said to be simple and direct. Experience has shown, however, that in practice the simple and direct laws have all been failures, while those condemned as complicated have succeeded so perfectly as to furnish the accepted model of all subsequent ones. This lesson ought to be of use to us in preparing our corrupt practices laws. It is true that the English act is long, but it is also true that it was so completely successful from the moment of its application to an election that it abolished corruption and bribery at a single blow. The minuteness of the law covered every form of corruption so surely that its practice without detection was found to be impossible. Any law which fails to do this is too short, no matter what its length. The English act, as one of its ablest commentators, Mr. Henry Hobhouse, says, "is pervaded by two principles: the first is to strike hard and home at corrupt practices; the second is to prohibit, by positive legislation, any expenditure in the conduct of an election which is not absolutely necessary." Both these principles were embodied in the act with such thoroughness that bribery disappeared instantly from English elections, never to return.

We can accomplish the same purification in this country, whenever public opinion reaches the point at which it is demanded. We must, as Professor Jenks points out, limit the expenditures in every instance, grading the maximum sum according to the office, and must require the sworn return of every penny received or expended, either by the candidate, or his agent, or his campaign committee. On every point the law must be drawn with such minuteness and clearness that evasion or violation will be impossible without detection and punishment. Then, too "assessments" upon candidates must be forbidden, and voluntary contributions from them must be limited, and the uses made of money strictly accounted for; every loophole of escape from the publication of every penny expended must be closed and barred. That is the strength which makes the length of the English statute, and we must have the sense as well as the courage to imitate it.

One new evil has sprung up here recently which Professor Jenks does not mention, and that is the hiring of registered voters to remain away from the polls. By

this method the briber is able to get positive proof that the bribed voter has kept his bargain. This practice would be broken up by the requirement of strict accountability for every penny expended. Like all the other evils, it exists only because of a kind of dullness of the public conscience, which, while it may not exactly condone bribery in elections, is not equal to the exertion of declaring that it will no longer be tolerated. Professor Jenks's words on this question of public responsibility are strong and to the point, and we commend them to the serious consideration of our readers. Public opinion is king in the United States, and it must bear the responsibility of all the sins which its own supineness or indifference permits corrupt politicians to commit.

What the Columbian Exhibition will do for America.

THE fact which most strongly impressed all visitors to the international exhibition at Paris in 1889 was its artistic character. Far beyond any of its predecessors in any land as a triumph of industry and a triumph of science, it was still more remarkable as a triumph of beauty. To perceive this fact, one did not need to enter the vast and stately palace filled with pictures and statues which showed the current work of all civilized countries, and, as in a splendid historical panorama, France's own work for a century past. Nor did one need to examine the buildings, or to study the sculptured decorations with which buildings and grounds were lavishly adorned. The most impressive, the most beautiful thing at the Paris Exposition was the conception of the exhibition as a whole: the choice and arrangement and planting of the site, the placing of the buildings, their design considered as factors in a great coherent yet diversified scheme, and the way in which all individual factors worked together toward a magnificently harmonious general effect. It was the general effect of this exhibition — the fine combining of its architectural, sculptural, and natural features — which gave it unique importance as an artistic spectacle.

All Americans who saw it must have said: "Only in Paris could such a result be achieved. Only the most artistic nation in the world could have achieved it; and even this nation could not if its artistic powers had been unorganized, uncontrolled. France possesses a far larger number of great artists than any other land. These artists have been trained in the same schools, are inspired by the same practical and esthetic ideals, and are used to working together, and to working under official control; and this exhibition is an official, Government enterprise. Under such conditions such success was possible; under other conditions it would be impossible. Under American conditions how could we hope to see it even remotely approached? How can we hope soon to see in America anything very different from what we saw at Philadelphia in 1876: a big industrial show, a triumph of commercialism and applied science, an exaltation of material wealth, where beauty existed only in certain collections almost altogether drawn from foreign sources, and where the desire for beauty, when it could be elsewhere divined, had been stunted by crude ignorance, limited by economy or deformed by the love of mere display, and stultified by the lack of any common ideal and the absence of any general scheme of arrangement and design? We

are not nearly so artistic a people as the French," we said to ourselves in Paris. "Such artistic power as we do possess is largely untrained, and such trained talents as we have are accustomed to work independently and along different paths. Whatever we may do will be done by unorganized public, not by organized official, effort; and so we can never have an exhibition which, as a whole, will approach the beauty of this one, or be half so useful in teaching how artistic talents of various kinds may best be utilized."

We said this in Paris, and, a year or so later, when the Columbian Exhibition of 1893 was decided upon, we said it again, and perhaps more emphatically, in the belief that such an enterprise would be less well carried out in a Western city than it might have been in Washington, as a Government enterprise, or in New York, the center of the artistic life of our continent. As the city of Chicago would appear to the eyes of the world if, for artistic importance, it were compared with the city of Paris, nearly so, all Americans feared, might the artistic importance of the Chicago Exhibition contrast with that of the last Paris Exhibition. Artistic capabilities, we knew, had vastly developed in our country since 1876. But our people, we thought, still did not rightly feel the difference between skill and ineptitude, between beauty and ugliness, and still did not rightly value skill and beauty even when it recognized them. And still there was no likelihood that the many hands which would have to plan and build the exhibition would agree upon any scheme of arrangement and treatment broad and firm enough to secure that fundamental harmony between part and part without which dignity, beauty, and impressiveness of general aspect could not be secured, and without which even the possible excellence of individual features would fail of its right effect. The very progress we had made in art during the past fifteen years seemed to make a harmonious exhibition improbable, for it had been progress along many diverging paths, and had meant rather the accentuation of artistic individuality than a growing concord in taste. Chicago, we thought, might show us some buildings and some collections much more beautiful than any we had seen in Philadelphia, but it would not show us a beautiful exhibition. The commercial, utilitarian side of American endeavor might not be so crudely set forth as in 1876; but at best we could expect only a carnival of conflicting individual efforts, where art, pseudo-art, frank utilitarianism, and a childish or a vulgar love of display would meet and struggle together.

Such anticipations as these were universal two years ago. We need not explain how radically mistaken they have already been proved. Mr. Van Brunt has told our readers how the great exhibition of 1893 was organized and how its site was selected—or, more truly, how the place for its site was chosen and then the site itself was almost literally created. He has told how architects of proven ability from various parts of the country were intrusted with the chief buildings, and how these architects consulted with each other and with the landscape architects as regarded the placing and the designing of their works. And he has described some of the buildings in detail, and has hinted at the harmonious grandeur and beauty of their general effect. He has shown that we are to have a very beautiful

exhibition, and has shown that it will be beautiful because those who are making it are working together in a brotherly spirit, according to a wise and well-defined artistic scheme, and with a distinct and lofty general ideal in their minds. He has shown that an association of practical American business men, securing funds for the most part by their own efforts, and employing a band of artists hitherto accustomed to work in entire independence of one another, will create an exhibition similar in interest, as a homogeneous artistic spectacle, to the one created by the Government of the most artistic nation in the world, exerting unlimited powers, and employing a corps of artists accustomed from their earliest student days to tread in the same paths and to work hand in hand.

But there is even more than this to be said. We confidently assert, on the evidence of all the most experienced judges of art whom it has been possible for us to consult, that the Chicago Exhibition will far surpass even the Paris one of 1889 when considered in its entirety and for its artistic interest. A much more beautiful, scholarly, and monumental type of architecture has been adopted for its main buildings; accessory works of an ornamental kind will be more numerous, more imposing, and more original, while at least equally artistic in character; greater care is being taken that harmony of effect shall not be injured by the aspect of minor works of utility or decoration; and the neighborhood of the great lake, and the novel and skilful way in which wide expanses of water and varied plantations have been made the basis of the plan of the grounds themselves, will much more than compensate for the absence of a rushing river like the Seine and a dominating hill like the Trocadéro. The Eiffel Tower is a marvelous, an interesting, and hardly an ugly structure; but it is not an artistic structure. It did not conflict with its surroundings at Paris. But anything resembling it—anything remarkable chiefly for size or for mechanical ingenuity—would look painfully out of place on the Chicago grounds. This fact suffices to prove their higher degree of beauty; and the fact that no conspicuous structure appealing in any way to mere curiosity, or to the love of the new or the marvelous, has been contemplated by the authorities at Chicago, proves how seriously and wisely artistic a spirit is controlling the great enterprise.

Those who fail to see the exhibition of 1893 will fail to see the most beautiful spectacle which has been offered to the eyes of our generation. But those who have time to see only its general aspect, without studying any of its collections—wonderfully interesting though these will be—will have seen the very best of it.

When we remember what a great impulse was given to the popular love of art by the collections shown in the exhibition of 1876, what may we not expect as a result of the stately, beautiful, and truly poetic panorama of art that will be unrolled before the eyes of the nation in 1893? It will show for the first time, to scores of thousands of Americans who have never traveled abroad and can scarcely hope to do so, what is the meaning of the word beauty, what is the significance of the word art. It will convince them, as nothing else but long and intelligent foreign travel could, that beauty is an enjoyable thing, that art is a thing worth striving for and paying for. Indeed, no amount of for-

eign travel could teach this lesson so clearly as it will be taught to the average American by the plain fact that all this stately splendor was thought worth getting and worth paying for by hard-headed American business men, and for a merely temporary purpose. One constantly hears expressions of regret that buildings and sculptures so costly and beautiful should be destined to last for a few months only. But, in truth, their transitory character will vastly augment their missionary power. Even the most ignorant may dimly understand that it is worth while to take pains and spend money upon a result which is to be for all time; but at Chicago they will be told that this is worth while even for a result of almost ephemeral duration.

But it is not merely the untraveled American, wholly ignorant and neglectful of art, whom the exhibition will profit and instruct. Cultivated Americans think well of their fellow-countrymen in many directions. But as a nation we have as yet too little faith in our artistic capabilities,—too little respect for the American artist, too little belief that the nascent love of the public for art is genuine, vital, and strong. The Columbian Exhibition will prove to the most doubting and critical spirit that American art exists, that it is capable of great things, and that it can do great things in a way distinctively its own. Had Chicago equaled Paris, it would be greatly to our credit; but it has surpassed Paris. Had it produced a beautiful exhibition in imitation of the Paris Exhibition, it would again be much; but it has conceived an entirely different ideal, and carried it out on entirely novel lines. We shall have an exhibition more dignified, beautiful, and truly artistic than any the world has seen; and it will be entirely our own, in general idea and in every detail of its execution. It will convince all cultivated Americans, we repeat, of the vitality and vigor and independence of American art; and, we believe, its effect upon the vast public which will view it will convince them of the genuineness of the nascent American love of art.

Of course the learning of these great lessons will quickly react for good upon the American artist, opening to him wider fields, creating for him a more sympathetic public, exalting him to nobler ambitions, inspiring him to more strenuous efforts, deepening and strengthening his self-respect and his respect for art as a valued factor in the life of the nation. So wisely have the architectural types for the chief buildings been chosen that, we believe, they will do much to determine the lines of our architectural work in the future; and, at all events, no artist who visits Chicago can fail to learn the great lesson that in harmony and fraternity of effort lies our best hope of a noble artistic development.

We shall not speak of the great effect this exhibition will have in increasing the respect of foreigners for the people of the United States. This seems to us a very minor point in comparison with the effect it will have upon ourselves. Its national will be of far more vital importance than its international effect. What we chiefly wish to lay stress upon is its claim upon Americans as a very beautiful spectacle, and, still more forcibly, its claim upon Americans as a very instructive

spectacle. It will delight their eyes as nothing else has ever done. It will teach them the nature and value of art as nothing else could do. And it will affirm and increase their faith in those democratic institutions which once more, in a new field, have proved themselves capable of a magnificent, an unrivaled achievement.

#### Liberty, Law, and Order.

GOOD citizens are often grievously perplexed by the contemplation of those situations in life where opposing opinions or interests are brought into sharp conflict, and where the thoughtful man finds a certain amount of justice on both sides, and therefore hesitates as to the side to which he will give his sympathies. We speak now of those cases where the good citizen is an onlooker merely, not where he is necessarily a participator in the struggle on one side or the other, for then he is quicker to make up his mind. If the conflict is between the Indian and the grizzly, there is apt to be a finer balancing of motives and rights than if the grizzly happen to be in pursuit of the citizen himself.

The only way we know of whereby these doubts and anxieties can be quickly resolved into definite views is by a firm grip upon a few definite principles. These are the days of special sympathy with the poor and with the so-called — and sometimes narrowly so-called — “working-classes,” — the days of new or renewed theories and experiments as to the relation of labor and capital. This is the present phase of the eighteenth-century revolution. Never was so much said or written and thought on these subjects. Meantime, while some are thinking, others are acting; theories are being put into practice, and in the process heads are being broken, and dynamite is destroying property and life.

Shall we not, then, says the doubting citizen, sympathize with “organized labor,” and with reasoned discontent, even if these lead in extreme cases to self-inflicted misery and brutal bloodshed? Oh, yes; sympathy is right, if this does not bring infirmity of purpose, and that softness of attitude which encourages violence and crime. Yes, sympathize wherever sympathy may be justly due; but cling to the solid rock of individual liberty, of obedience to law, and the preservation of the peace! And do so for the very reason that in this world it will take so long to straighten things out in a way satisfactory to all. The readjustment of interests, the experimenting with new economical and governmental devices, will be such a slow process; there will always be so many apparent causes of discontent, that, unless by general consent these matters are arranged by peaceful methods, perpetual war, secret and bloody plots, infamous assassinations, will make life on this planet, to say the least, even much more unpleasing than it now is. Violence and crime, committed in no matter what honest name, are anarchy; and anarchy, in a free country, must be stamped out like the plague,—with the discrimination and the remorselessness of justice.

## OPEN LETTERS.

### "The Numerical Strength of the Confederate Army."

I. A SOUTHERN VIEW OF THE QUESTION.

IN THE CENTURY for March I find an article entitled "The Numerical Strength of the Confederate Army," in which the author, Mr. A. B. Casselman, expresses the opinion that it would not be difficult to prove that the total number of men enrolled in the Confederate army from the beginning to the close of the war was not far from 1,500,000. He bases this opinion upon the number of troops which, according to his estimate, North Carolina furnished to the Confederacy, his supposition being that North Carolina furnished one tenth of the strength of the Confederate army. That this estimate of Mr. Casselman is far too high is easy to see, if certain facts are taken into consideration. I purpose stating these facts and the conclusions to be drawn from them.

The total population of the eleven States that seceded was 9,100,789, of which 5,446,919 were white and 3,653,870 were colored. But West Virginia, as is well known, seceded from Old Virginia and from the Confederacy. The population of West Virginia at that time was 376,488, which, being deducted from the population of the eleven seceded States, leaves 8,724,301 as the total population of those States. As the white population of West Virginia was at that time about 361,000, the total white population of the Confederate States was 5,085,919. Now North Carolina's white population was 629,942. Only two other States of the Confederacy had so large a white population as North Carolina. These were Tennessee and Virginia, the former having 826,722 white inhabitants, and the latter 686,299 (after deducting the white population of West Virginia).

Mr. Casselman states that Major John W. Moore, late of the 3d North Carolina Battalion, made an estimate that his State furnished to the Confederacy 150,000 men; but admits that Major Moore, after the most careful investigation, changed his estimate to 125,000. Now if we take the highest estimate for North Carolina, as Mr. Casselman prefers, and assume that each of the other Confederate States furnished troops in the same ratio, we will find the total number of troops raised by the eleven Confederate States to be 1,211,000.

But there are some things to be considered which Mr. Casselman seems to have lost sight of entirely. During 1861 it was impossible for the Confederacy to put large armies into the field, because arms were not to be had. Of more than 300,000 enrolled, many thousands were in camps of instruction waiting for arms. The result was that in the early spring of 1862 the Confederate armies were so greatly outnumbered that they could do nothing but retire before the Union armies as they advanced. Had the other Union generals possessed Grant's energy, and been untrammelled by their Government, the Confederacy might have been crushed early in 1862. But when the fall of Donelson came like a thunderclap, the Confederacy was aroused to prompt and energetic action. The Con-

script Act was passed in April, 1862, two months after the fall of Donelson. The old regiments were rapidly filled up, new ones were formed, and throughout the South the greatest activity prevailed. By this time large supplies of arms began to pour in, brought by the blockade-runners, and others were manufactured in the newly established workshops of the South. The Southern armies were largely increased in numbers and efficiency, and, had the South retained all the territory that she held in 1861, her armies might have come somewhat nearer than they actually did to the figures claimed by Mr. Casselman for 1861 and 1862, viz., 850,000. But it must not be forgotten that before the passage of the Conscript Act the western Confederate armies had been forced back to the borders of Alabama and Mississippi; that the larger portion of Tennessee was in the grasp of the Union armies, and that before the month of May the city of New Orleans, containing more than a third of the white population of Louisiana, was also under Federal control. A large part of Northern and Eastern Virginia, containing several of the large towns of the State, was also occupied by the forces of the Union early in May. The Kentucky campaign of Bragg and Kirby Smith recovered a part of Middle Tennessee, but at least one third of the State was in Federal possession during 1862, and three fourths of it after the summer of 1863. Early in 1863 the larger part of Arkansas was occupied by the Federal armies. The first Conscript Act was passed April 16, 1862. This embraced all the white men in the Confederacy between the ages of eighteen and thirty-five. On September 27 of the same year all white men between the ages of thirty-five and forty-five were placed in the military service for three years. On February 11, 1864, the Conscript Act was further extended to embrace all white men between the ages of seventeen and fifty. By this time almost the entire State of Tennessee was occupied by the Federal armies. Surely it will not be claimed that every man or boy capable of bearing arms throughout all this lost territory was enrolled in the Confederate armies. The eleven seceded States furnished to the Union 54,000 white troops, of whom 31,000 were furnished by the State of Tennessee. Of course they should be deducted from the aggregate of the Confederate armies. Making all proper allowances, the South lost the services of more than 200,000 men, who otherwise might have been enrolled in her armies. One million men is therefore a liberal estimate for the total enrollment in the Confederate armies, counted at the very highest figures. But in reality 125,000 men is a liberal estimate for the number of troops furnished by North Carolina. On this basis, making the same calculations and allowances as before, the Confederacy could not have brought into the field, from first to last, including all sorts of troops, much more than 800,000 men.

Mr. Casselman says that the people of the border slave States—Kentucky, Maryland, and Missouri—"were not unevenly divided, and gave about an equal number of men to each army." If Mr. Casselman will

give this assertion careful thought, he will be convinced that it is not borne out by the facts. Maryland gave 34,000 men to the Union armies, Kentucky 51,000, and Missouri 100,000. Maryland was too firmly held by the Federal armies to furnish any considerable number of men to the cause of the South. The same is true, for the greater part of the war, of Kentucky and Missouri. While there were earnest Southern sympathizers in Kentucky and Missouri, the great mass of the people in those States stood firmly on the side of the Union. General Albert Sidney Johnston, in a letter to Mr. Davis written in March, 1862, says that no enthusiasm for the Confederacy, but hostility, was manifested during his stay in Kentucky: hence but few Kentuckians joined his standard. We have the testimony of Union and Confederate officers for the statement that the Bragg and Kirby Smith expedition did not add more than a brigade to the Confederate strength. Search the published records of the composition of the respective armies, and it is easy to see how greatly the number of Union regiments from those States exceeded the number of Confederate regiments. There was never a possibility of enforcing the Conscription Act in those States, and but very little chance after February, 1862, for any of their citizens who desired so to do, to enlist in the armies of the Confederacy. As to Maryland, there was exceedingly small opportunity for such a thing even in 1861. I cannot find from the records that these three States furnished even as high as 60,000 men to the Confederacy.

"The principal ex-Confederate historians . . . who held high civil or military rank in the Confederate government" were as high-minded and honorable men as any that this world can boast, and would not stoop to misrepresent facts. Their estimate of Confederate strength (viz., about 700,000 men) comes much nearer the mark than the excessive estimates made by some writers on the other side. The Confederate armies reached their maximum effective strength for the field during 1862. After that year there was a steady decline in their numbers, and all the efforts of the Confederate government to fill up their depleted ranks were unavailing. Adjutant-General S. Cooper says that for the last two years of the war the active force present in the field was nearly one half less than the returns called for. As to the incompleteness of Confederate muster-rolls, is not this mainly due to losses of official papers that must have occurred on the sudden collapse of the Confederacy? But the rolls in possession of the officers in the field, on which depended the necessary knowledge of the condition of their commands, were correct, and the official reports of Confederate strength in the several battles of the war, as made by their commanders, can be relied upon as accurate.

The thought that one is standing between his loved home and war's desolation will nerve even a timid heart, and make strong a feeble arm. What wonder then that brave men fired by such a conviction should so often have proved more than a match for superior numbers of men equally as brave, but without the same conviction of ruin threatening their homes and loved ones? It was the conviction that on them depended the very existence of Southern civilization, and the salvation of their homes from utter ruin, that caused the thousands of raw recruits in the Seven Days' Battles around Richmond to rival the valor of seasoned veterans. It was

this same conviction that made such heroes of the boys of the Virginia Military Institute at New Market in May, 1864, and of the mere striplings of fifteen and sixteen years of age at Honey Hill in South Carolina on November 30 of the same year.

Our Northern brethren need not wonder that heavy odds were required to crush the South. The record of the race to which they and we belong proves that under like circumstances it would take as heavy odds to conquer them.

MACON, GA.

*Joseph T. Derry.*

#### II. MR. CASSELMAN'S REJOINER.

IN my original paper I alluded to the well-known fact that the records of the Confederate army are so incomplete that it is impossible to state exactly, or even to estimate very closely, its total strength; which, however, I expressed the opinion was not very far from 1,500,000. I alluded also to the fact, equally well understood, and specifically referred to by General Grant in his "Memoirs," that Confederate historians have always understated its strength,—a fact which is further shown, I think, by Mr. Derry's article. In the absence of sufficient available data for a close estimate, I should not now add further argument but for the reason that the subject plainly deserves more attention than it has ever received, and hence any discussion which serves to bring into prominence the salient facts must result, eventually, in benefit to the cause of historical truth.

Mr. Derry estimates that the total strength of that army could not have been much above 800,000. This is a gain of 200,000 over the figures of A. H. Stephens. But in this estimate he excludes altogether all of the troops furnished by four Southern States—West Virginia, Kentucky, Missouri, and Maryland. He seeks to justify this by asserting that the number of Confederate troops from those States did not more than equal the 54,000 Union troops from the other Southern States, 31,000 of whom were from East Tennessee; and that "the great mass of the people of those States were firmly on the side of the Union." Other Southern writers likewise assume that the border slave States furnished only a few thousand troops to the Confederate army,—far less than to the Union army: an assumption which is certainly contrary to the fact, as I shall undertake to show.

In the Senate of the United States at this time, West Virginia is represented by two ex-Confederate soldiers; Missouri is represented by an ex-Confederate soldier and an ex-member of the Confederate Senate; Kentucky, by an ex-Confederate soldier. Thus, five of the eight United States senators from those States are ex-Confederates. Not one of the eight was a Union soldier, nor otherwise distinctively identified as a Unionist. It is remarkable, therefore, that ex-Confederates should be thus preferred for offices of trust and honor, if, as Mr. Derry contends, "the great mass of the people of those States were firmly on the side of the Union."

Four fifths of the people of those States were of Southern birth. Socially and politically their sympathies were all with the South, with which they were likewise identified in their material interests, in the institution of slavery. Whatever cause existed to justify the South in the war affected the border slave States as well as those of the interior. They had a slave population of 427,000, representing a value of two hundred million dollars. In

1861 the governors of Kentucky and Missouri both at heart favored secession; the latter renounced his office, left his State, and gave his personal services to the Confederacy; and subsequently the Confederate Congress admitted both of those States as members of the Confederacy, to which, with their slaves, they would certainly now belong, had the South succeeded. Politically, these States constitute, at this time, parts of the "Solid South," the same as Georgia and Virginia, and for the same reason,—because of the race question, growing out of the freeing and enfranchisement of their slaves. It is indeed true that in the beginning the people of the border States strongly opposed secession; but the same was also true of Virginia, North Carolina, and other Southern States.

The census of 1860 shows that the three States, Missouri, Kentucky, and Maryland, had white males of military age—*i. e.*, between 18 and 45—to the number of 516,000. Allowing for the youths who attained to the military age from 1861 to 1864 inclusive, the number would reach nearly 600,000. Of these, 180,000 served in the Union army. There were, therefore, fully 400,000 Southern men of military age in those three States, who were not in the Union army, as against 180,000 who were. In the year 1861, most of the important military operations were those in the border States; and throughout the war they were overrun or infested by partizan troops, so that the war spirit was more intense in those States than elsewhere.

These facts, when fairly considered, leave room for only one of two conclusions: either those States furnished, at the lowest calculation, as many men to the Southern as to the Northern army, or else the men whose sympathies and interests were with the South, in those States, were greatly wanting in military spirit, and were without the courage to fight for their convictions. The latter conclusion I do not entertain. On the contrary, I doubt not the truth of the famous declaration of a Kentucky senator, that "Kentucky has its quota full on both sides." And the same was doubtless true, at least so far as the South was concerned, of all the border slave States. The fact that there are no complete records of the Southern troops proves nothing, and is not a fair or legitimate argument.

Mr. Derry, after having excluded from his estimate all the troops from four Southern States, deducts from my estimate the further number of 200,000 upon the assertion that in certain portions of Virginia, Tennessee, and in the city of New Orleans, which early in 1862 were occupied by the Union forces, the Confederate government could not enforce the conscript laws. In this statement he makes little or no allowance for volunteers, but seems to assume that none served in the Confederate army except the conscripts. Virginia and Tennessee were in great part the battle-grounds of the war, and they were overrun and occupied in turn by both armies. The men in those States, more than those of any other, were compelled to serve on one side or the other, and they did so to the last man, as everybody knows. To assert that 200,000 men, principally of Virginia and Tennessee, either from cowardice or want of convictions, looked idly on at the heroic struggle that was being waged upon the soil of those States, taking no part on either side, is so manifestly unreasonable, and the accusation is so new, that it seems scarcely necessary to deny it.

Two of Mr. Derry's arguments appear to be inconsistent. In one he assumes, what I concede, that the Confederate army was composed in a great measure of conscripts, whose service in that army, therefore, was involuntary. But on the other hand he contends that this army was inspired by such lofty convictions of duty that, under this inspiration, they "often have proved more than a match for superior numbers of men equally as brave, but without the same conviction of ruin threatening their homes and loved ones." I regret that Mr. Derry has repeated an argument, which is not uncommon with Southern writers, in which he sets up this comparison which seeks to disparage the patriotism and sense of duty of the Union army. I have tried in vain to comprehend how brave and honorable men of the South can insist upon such a comparison. Let us consider a few facts touching the question of the patriotism of the Confederate army. It is an undoubted fact that tens of thousands of the men in that army had opposed, and voted against, secession, and in their hearts believed it to be wrong. The State of North Carolina, for instance, never adopted an ordinance of secession by direct popular vote. It was once submitted to the people of that State, who voted against it; although it is true that when the war was fairly begun they were well united in its support.

In 1863 and 1864 six regiments of United States troops, organized for service against the Indians, were composed entirely of Confederate prisoners, who thus returned to an allegiance which in their hearts they had never wholly forsaken.

In the great battles which decided the war, "the thought of loved ones at home" wrought no greater effect with one army than with the other; and a majority of the troops on either side were not natives of the State on whose soil the battle was fought. The Southern troops displayed as magnificent courage on the soil of Pennsylvania, at Gettysburg, as they ever did in Virginia; and why should they not?

Putting aside this argument as to the comparative devotion of the opposing armies, let us turn again to the legitimate argument of figures.

The State of North Carolina furnished, in the year 1861, forty-two regiments of Confederate volunteers, the minimum number in a regiment, according to the regulations, being one thousand. Moore's roster preserves the names of over 32,000 of those who enlisted in that year; but allowing for the numerous admitted deficiencies in the rolls, the number doubtless exceeded 40,000. In that first year, after the war had fairly begun, the South displayed a zeal and enthusiasm in the conflict beyond that which was then shown in the North. Counting the troops from the border States, who were all or nearly all volunteers, and who enlisted early in the war, the forty-two regiments of North Carolina troops constituted perhaps less than a tenth part of the Confederate army for that first year. The act of the Confederate Congress of August 8, 1861, authorized a call for 400,000 volunteers; and without doubt the army for that year comprised over 400 regiments and upward of 400,000 men,—all volunteers.

Before the end of 1862, under the conscript laws then in force, the North Carolina contingent had more than doubled. Moore's roster preserves the names of about 85,000 men who were enrolled in the years 1861 and 1862. But this roster omits thousands of names; the

actual number, therefore, must have been almost 100,000. And what reason is there to doubt these figures, when, after 40,000 volunteers had enlisted from that State, the Confederate government called for all who remained between the ages of eighteen and thirty-five years? These figures indicate, unmistakably, a Confederate army of more than 800,000 men, before the war was half over, and before that army had met its first great defeat. In the last two years of the war, all know what heroic measures were adopted to fill the ranks of that army: how regiments were organized of stripling boys and aged men; and how the "slaves," the "free negroes," and "other free persons of color" were conscripted under the act of February 17, 1864, for the performance of "auxiliary military duty."

The eleven States had, in 1860, a free colored population of 132,660. Of these there were probably 25,000 males of military age. In 1864, owing to contraction of the Confederate lines, the number was less. This item in itself, therefore, is insignificant. But the fact that the Confederate Congress enacted a law to conscript the few scattering free colored men of the South, as well as the slaves, serves to illustrate the desperate measures that were employed to utilize the services of every human being within the Southern territory who was capable of carrying a gun or digging a trench.

Mr. Derry's estimate takes, as the basis of his calculation, 125,000 as the number of troops furnished by North Carolina. But that is the lowest possible estimate for the troops of that State. I am certain it is too low, even if the estimate of 150,000 is too high.

After a careful review of Mr. Derry's article, I think it will be seen that upon the whole it confirms my main conclusions, in which, however, I do not assume to have been exact. It shows that, starting with the lowest basis of calculation, excluding all the troops of four Southern States, and then deducting 200,000 more upon an assumption which seems to impeach the courage and manhood of a large proportion of the men of the South, it still leaves, according to his figures, an army of "not much more than 800,000."

This, it seems to me, concedes much of what I claim. If impartial investigators shall ever be able fairly to count all the Confederate troops, without such manifestly unreasonable deductions, I still think it will be found that the number was not very far from 1,500,000. In any close estimate, due allowance must be made for the 54,000 Union troops from the seceding States.

One thing seems clear. The statements commonly made by leading Southern writers, that the Confederates numbered in all only six or seven hundred thousand, against over two million Federals, are widely at variance with the facts, and are more extraordinary because they are made by those writers who, above all others, ought to know the truth. It is impossible that

the men of the South, whose courage and honor have never been called in question, can sanction the efforts which some have made to juggle with this question, or to disparage the patriotism and courage of the brave men who opposed them.

*A. B. Casselman.*

"The Century's" American Artists Series.

WYATT EATON.

It is hard to realize the change which has taken place in American art during the last fifteen years. In 1877 the principal exhibition of the country, the National Academy of Design, admitted three works which, although different in style, were each equally revolutionary: "The Dowager," by William M. Chase; "A Britany Woman," by Alden Weir; and "Revery," by Wyatt Eaton. The first of these bore the stamp of Munich, the last two that of Paris. Each was the work of an American who, unknown in our art circles, had been long enough abroad to assimilate the newest art movements of Europe. This was the beginning of the change.

In 1877 Wyatt Eaton had been studying art for eleven years: the first five in New York as a student of the National Academy of Design, and as a pupil of the late J. O. Eaton, who had befriended him when, a lad of eighteen, he had left his native village on the shores of Lake Champlain for New York; later, from 1872 to 1876, as a pupil of Gérôme at L'École des Beaux Arts, Paris. During this period he painted the "Revery" and "Harvester at Rest," both of which were exhibited at the Salon, the latter being now in Smith College, Northampton, Mass.

Some of his first work after his return home was done for this magazine, including a series of remarkable portraits of Bryant, Emerson, Longfellow, Whittier, and Holmes, for which these gentlemen gave him sittings, and which were engraved by Cole. These were perhaps as remarkable for their engraving as for their drawing, and were a veritable new departure in magazine work. He also made a drawing from life of Dr. J. G. Holland.

In 1877 Wyatt Eaton, with Walter Shirlaw, Augustus St. Gaudens, and Helena de Kay Gilder, founded the Society of American Artists, of which Mr. Eaton was the first secretary and Mr. Shirlaw the first president.

Although Wyatt Eaton is an accomplished landscape-painter and a brilliant painter of the nude, he is known principally by his portraits. Among those who have sat to him are the Right Rev. Horatio Potter, Mr. Roswell Smith, and Sir William Dawson. He also painted a portrait of Garfield (after the President's death) for the Union League Club of New York. "The Man with a Violin" (a portrait of the engraver Timothy Cole), which is printed on page 882 of the present number, was painted in Florence, Italy.

*W. Lewis Fraser.*

## IN LIGHTER VEIN.

The Happy Poet.

Mistaken Magnanimity.

**H**IS moods are mirrored in his songs,  
Hence gladness to his verse belongs:  
Looking into his heart to write,  
All that he finds there is Delight!

*Frank Dempster Sherman.*

THE storm of words was past, the air was cleared,  
When "I forgive you!" thus he volunteered,  
"If any one forgives," she said, "'t is I!"—  
The storm returned, and murky grew the sky.

*Edith M. Thomas.*

## What She Said About It.

LYRICS to Inez and Jane,  
Dolores and Ethel and May;  
Señoritas distant as Spain,  
And damsels just over the way!

It is not that I'm jealous, not that,  
Of either Dolores or Jane,  
Of some girl in an opposite flat,  
Or in one of his castles in Spain.

But it is that, salable prose  
Put aside for this profitless strain,  
I sit the day darning his hose,  
And he sings of Dolores and Jane.

Though the winged horse we know must be free  
To "spurn [for the pretty] the plain,"  
Should the team-work fall wholly on me  
While he soars with Dolores and Jane?

I am neither Dolores nor Jane,  
But to lighten a little my life  
Might the Poet not spare me a strain—  
Although I am only his wife!

*Charles Henry Webb.*

## A Metrical Miniature.

HER eyes display a blended hue  
Of summer skies and violets blue,  
With just a hint of April dew  
To make her glances bright;  
But, lest their luster be too fair,  
And brighter than the world could bear,  
Long lashes, like a silken snare,  
Befringe her lids of white.

Shy apple-blossoms flushed with morn  
Have lent their color to adorn  
Her cheek, whereon is gaily born  
A dimple with each smile.  
Her wayward tresses scorn to rest  
By ribbon bound or fillet prest,  
And ever weave at their behest  
Fresh graces to beguile.

Her curving lips by turns recall  
Red roses, poppies, cherries—all  
That wins the eye or could enthral  
A hermit or a saint.  
Her gleaming teeth 't were vain to hymn:  
The brightest words are all too dim;  
The artist who their light would limn  
Must crush a pearl for paint.

Beneath her kirtle peep a foot  
That charms in slipper, gaiter, boot;  
Whose music makes the birds grow mute  
With bended heads to hear.  
Her hand can boast perfection's mold,  
In winter warm, in summer cold,  
And just the temperature to hold  
At any time of year.

A snowy neck, a witching chin,  
An ear in tint the sea-shell's twin,  
A saucy nose—just put that in—  
The bonnie little belle!  
Her name? Ah, there I hesitate;  
With many a rival at her gate,  
Her name, until I know my fate,  
'T were wiser not to tell.

*Samuel Minturn Peck.*

## Reflections.

THOSE are kind who give us, not what they think  
is fine, but what we ourselves want.

THE whim of to-day is the impulse of to-morrow—  
the wish of next week—the good or bad taste of next  
month—the habit of next year—the instinct of your  
descendants.

SOME people have to have their sunshine warm;  
others are satisfied just with its being sunshine.

THE perfumes that women wear so extravagantly are  
a great mistake. Instead of reminding us sweetly of  
flowers, the flowers are beginning to remind us pain-  
fully of perfumes. I am beginning to hate violets.

THERE is such a thing as too much kindness; as if  
one should carefully toast the bread for a bird, or  
spread with mayonnaise the lettuce for a rabbit.

SHE rules me merely by expecting things of me  
which I should be ashamed not to be equal to.

SHE demanded the story of his past; but the ques-  
tion is less what our past has been, than what our past  
has made of us. Not "What were you?" but "What  
are you?"

PERHAPS the gods will forgive us for having loved a  
little things we ought not to have loved at all, if only  
we have loved most the things that we ought to love.

LIKE a serenade, outwardly wishing sweet rest and  
sleep to the beloved, but cunningly adapted to keep  
her very wide awake and attentive to the serenader.

TOLERATION of the intolerant is the hardest thing  
for a bigoted radical.

HE was willing to forgive them himself, but he  
hoped the Lord would n't.

THE test of a great love—yes, even of a supreme  
passion—is not what it demands, but what it consents  
to do without.

SOME people think that they are good if they are do-  
ing good. Others think they are doing good merely  
by being good. Both are frequently mistaken, and  
certainly neither is complete. Again, some people  
think to make up for doing one thing very wrong by  
doing a great many little things that are very good; like  
a child who, planning to go fishing in the afternoon  
without asking for a permission which he fears may  
be refused, comforts his conscience by being particu-  
larly gentle and obedient all the forenoon in matters  
of no consequence. We call it hypocrisy when we find  
the forger or embezzler joining the church; but it is  
entirely possible that his feeling in doing so is not  
the culpable one of trying to conceal his sins, but the  
perfectly genuine wish to restore his self-respect by at  
least doing right somewhere.

I WONDER why it is that the charm of the wholly  
reliable becomes monotonous, compared with the in-  
herent witchery of moods which you never can predict.  
The perfectly delightful woman would perhaps be one  
of whom you would never feel quite sure as to what  
she was going to do, and then always find that she in-  
variably did do the right thing.

WE speak sometimes of a "dominant" trait or pas-  
sion or mode of thought; but it is often probable in a  
mind of this sort that there are really no other traits  
or passions or modes of thought. Mastery in one  
thing may mean merely the monotony of the whole.

It is so much more fun to be richer than merely to  
be rich!

*Alice Wellington Rollins.*
